Medical Press & Circular

Being the Incorporation of the Journals hitherto known as "The Medical Press" and "The Medical Circular."

VOL. IV. No. 23. | LONDON: WEDNESDAY, DECEMBER 4, 1867. | FIVEPENCE. SIXPENCE STAMPED.

LECTURE.

Clinical Lecture on a Case of Fronto-Temporal Neuralgia, attended with Cerebral Disorder. By C. Handfield Jones, F.R.S., Physician to St. Mary's Hospital..... 501

ORIGINAL COMMUNICATIONS.

Surgical Commentaries: Intended as a Digest of the Author's Principles and Practice, as Illustrated by the more Important Subjects of Surgery. By Geo. Macilwain, F.R.C.S., &c..... 502

A Brief Account of an Epidemic of Typhus Fever which Occurred in Portlaw, in the Winter of 1866, and Spring and Summer, 1867. By James Martin. 504

Re-Union of an Amputated Finger. By Walter Bernard, L.K.C.P..... 506

HOSPITAL REPORTS.

RICHMOND, WHITWORTH, AND HARDWICKE HOSPITALS—
Dr. Fleming's Surgical Clinique.—No. I.—Hernia and Hydrocele—Distribution of Trusses..... 506

CITY OF DUBLIN HOSPITAL—
Cases of Onychia Maligna, treated by the Local Application of Potassa Fusa, with Observations. Under the care of Dr. Geoghegan..... 506

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.—
Venous Nævi, treated by Introduction of Bruce's Gas Cautery. Operation for Single Hare-Lip. Removal of Tumour from beneath the Tongue. By Mr. Porter..... 509

ST. THOMAS'S HOSPITAL—
Compound Fracture of the Skull with Depression; Recovery without Operation. Under the care of Mr. Solly..... 509

REVIEWS.

Anderson's Practical Treatise upon Eczema..... 511

Rasmussen on Sclerodermia and its Relation to Elephantiasis Arabum. Translated by Wm. D. Moore, M.D., &c..... 511

LEADING ARTICLES.

THE IRISH APOTHECARIES' COMPANY..... 512

Medical News, Notices to Correspondents 521

Now ready, with 109 Engravings on Wood, 8vo, cloth, 10s. 6d.

LECTURES ON THE PROGRESS OF ANATOMY and SURGERY during the present Century. By SIR WILLIAM FERGUSSON, Bart., F.R.S., Professor of Surgery in King's College, London; Surgeon to King's College Hospital; late Professor of Human Anatomy and Surgery in the Royal College of Surgeons; Sergeant-Surgeon to H.M. the Queen.

London: John Churchill and Sons, New Burlington-street.

Now ready, 8vo, cloth, 5s.

ON THE DISTINCTIVE CHARACTERS OF EXTERNAL INFLAMMATIONS; on Inflammatory or Sympathetic Fever; and the Results of Thirty-six Years' Experience of the Effects of Bleeding. By J. H. JAMES, F.R.C.S., Consulting-Surgeon to the Devon and Exeter Hospital.

London: John Churchill and Sons, New Burlington-street.

Just published, fcap. 8vo, cloth, 2s. 6d.

AN Essay on the Maintenance of Health. By HENRY LOWNDES., Surgeon to the Liverpool Northern Hospital.

London: John Churchill and Sons, New Burlington-street.

Now ready, fcap. 8vo, cloth, 2s. 6d.

THE CHOLERA: its Origin, Idiosyncrasy, and Treatment. By FERDINAND E. JENCKEN, M.D., M.R.C.P.

London: John Churchill and Sons, New Burlington-street.

Just Published, 8vo, 1s.

COTTAGE HOSPITALS: their Objects, Advan-tages, and Management. By E. J. WARING, M.D.

London: John Churchill and Sons, New Burlington-street.

On the 1st of December, Second Series, No. 102, price One Shilling.

THE PHARMACEUTICAL JOURNAL,

CONTAINING THE

TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.

CONTENTS.—Inducements to Study.—The Preservation of Syrup of Iodide of Iron.—Preparation of Suppositories and Medicated Pessaries.—On the Preparation of Microscopic Crystals.—Liverpool Chemists' Association.—Leeds Chemists' Association.—Dundee Chemists' Association: Presentation.—Sheffield Association of Chemists and Druggists.—Bath Chemists' Association.—Note on a New Kind of Kamala; Tampico Jalap; On Attar of Rose; On the Determination of Organic Matter in Water; Liebig's Extract of Meat; Liebig's Extract of Meat Company (Limited) *versus* Hanbury.—'An Introduction to Pharmaceutical Chemistry.'

London: John Churchill and Sons, New Burlington-street.

HEALTH, FRESH AIR, PURE WATER.

Works Embracing these Important Matters, By H. B. CONDY.

AIR and WATER, their Impurities and Purification. 8vo, wrapper, 1s.—"This is a valuable work, to be recommended for its sound chemistry and the very excellent instructions it gives both for the purification of bad air and bad water."—*Brit. and For. Med.-Chir. Review.*

DISINFECTION and the PREVENTION of DISEASE. 8vo, coloured wrapper, pp. 95, 1s.—"We can recommend this essay of Mr. Condy."—*Medical Press and Circular.*

London: Robert Hardwicke, 192, Piccadilly.

Cheaper Edition, with New Supplement.

Now ready, 8vo, pp. 466, with Illustrations, 8s. 6d.,

THE DISEASES OF THE EAR: their Nature, Diagnosis, and Treatment. By JOSEPH TOYNBEE, F.R.S., with a Supplement by JAMES HINTON, Aural Surgeon to Guy's Hospital.

Extract from Preface.—"I have sought to the best of my ability to add whatever is necessary to make it a faithful, though very brief, representative of all that is certainly known on the practical aspects of the subject."

London: H. K. Lewis, 136, Gower-street, W.C.

WORKS BY

JOHN CHAPMAN, M.D., M.R.C.P.

Just Published, in 8vo., cloth, price 7s. 6d.

Diarrhœa and Cholera: their Nature, Origin, and successful Treatment through the agency of the Nervous System. Second edition, enlarged.

Epilepsy, Paralysis, and other Diseases of the NERVOUS SYSTEM: cases illustrative of their successful Treatment, chiefly by means of Ice. *Preparing for publication.*

Also, already published, price 2s. 6d.

Functional Diseases of Women: cases illustrative of a New Method of treating them through the agency of the Nervous System, by means of Cold and Heat; with an Appendix, containing Cases illustrative of a New Method of treating Epilepsy, Infantine Convulsions, Paralysis, and Diabetes.

The Sickness of Pregnancy, and of other Uterine AFFECTIONS; its Pathology and successful Treatment through the agency of the Nervous System, by means of Ice. *Preparing for publication.*

Sea Sickness: its Nature and Successful Treat-ment through the Agency of the Nervous System, by means of Ice. 8vo, price 2s. 6d.

London: Trübner and Co., 60 Paternoster-row.

Just out, in one thick vol., 8vo, cloth, price 25s.

Principles of Chemistry Founded on Modern THEORIES. With numerous Wood Engravings. By M. NAQUET, Professeur Agrégé á la Faculté de Médicine de Paris. Translated from the Second Edition, lately published, by WILLIAM CORTIS, Student, Guy's Hospital. Revised by THOS. STEVENSON, M.D., Demonstrator of Practical Chemistry, Guy's Hospital.

London: Henry Renshaw, 356, Strand.

Now ready, price 1s. 6d.

STATE MEDICINE IN GREAT BRITAIN AND IRELAND. Dr. RUMSEY'S Address at the recent Medical Congress in Dublin.

London: William Ridgway, 169, Piccadilly, London, W., and all Booksellers.

Second Edition, price 7s. 6d.

GRAY ON ARTIFICIAL LIMBS. By Frederick Gray, Sole Operator to the Late Marquis of Anglesey. Dedicated by special permission to Sir B. C. BRODIE, Bart.

H. Renshaw, 356, Strand.

MESSRS. FREDK. and PHILIP GRAY'S extensive practice enables them to make Artificial Limbs only, and their success is acknowledged to stand unrivalled.—7, Cork-street, Burlington-gardens, London, W.

EPILEPSY: its Symptoms and Treatment. By J. RUSSELL REYNOLDS, M.D., Lond. F.R.C.P., Physician to the National Hospital for the Paralysed and Epileptic, Professor of the Principles and Practice of Medicine in University College, Physician to University College Hospital.

John Churchill and Sons, New Burlington-street.

BY DR. BARR MEADOWS,

Physician to the National Institution for Diseases of the Skin.

New (Fourth) Edition, cloth, price 2s. 6d.

ERUPTIONS, their Real Nature and Rational Treatment; with Remarks on the Abuse of Arsenic, Mercury, and other reputed Specifics.

London: G. Hill, 154, Westminster-bridge Road.

THE Visiting List for 1868 will be ready in November.

Complete Set of Medical Account Books for 1868. Now ready. Prospectus post free on application.

Register of Obstetric Cases. Published with the authority of the Obstetrical Society. 250 Cases, 2s.; 500 Cases, 3s.

London: John Smith & Co., 52, Long Acre.

Now ready, Demy 8vo, cloth, price 3s. 6d.

PHYSIOLOGICAL REMARKS UPON THE CAUSES OF CONSUMPTION. By VALENTINE DUKE, M.D., Fellow of the Royal College of Surgeons, Ireland; Licentiate of the King and Queen's College of Physicians.

London: Longman, Green, and Co. Dublin: Fannin and Co.

Now ready, 8vo, 16s.

THE MICROSCOPE IN MEDICINE. By Dr. LIONEL S. BEALE, F.R.S. Third Edition, much Improved. Illustrated with 58 plates, containing upwards of 450 Illustrations, almost all of which are original, and have been drawn on Wood by the Author.

London: John Churchill and Sons.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

Brown's Cantharidine Blistering Tissue, prepared from pure Cantharidine. An elegant preparation, vesicating in much less time than the Emp. Lyttæ, P.L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent practitioners in the kingdom.—In tin cases, containing ten feet, 6s. 6d.; and small cases of five square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.

An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, Burns, &c., and may be called a companion to the above.—In tin cases, containing twelve square feet, 1s. 6d. each.

Sole Inventor and Manufacturer, T. B. BROWN, Perry Barr, Birmingham. Sold by all Wholesale and Retail Druggists and Medicine Agents throughout the British Empire.

Dublin: Messrs. Boileau and Boyd, 91, 92, & 93, Bride-street.

Sir J. MURRAY'S Pure Fluid Magnesia is recommended by Physicians since 1807 for Bile, Acidities, and Indigestion. They also order his CORDIAL CAMPHOR (3 grs. per ounce) as the best restorative for weak nerves or low fevers. His LEMON SYRUP, mixed with either Fluid, forms a brisk Aperient for any age—bottles 1s. and 2s. 6d. To guard against false liquids the Patentee's labels are subscribed "Sir J. MURRAY, Physician to the Lord Lieut."

BEWLEY, HAMILTON & Co.'s

COD-LIVER OIL OF 1867.

This Oil, as originally prepared by them in 1850, and since then yearly, with the increasing approbation of the profession, and of those numerous Invalids who have derived such inestimable benefits from its use, is extracted from the fresh Livers of the Channel Cods, on B. and H.'s own Premises, and under their immediate superintendence, and is possessed of the properties of this valuable Medicine in an eminent degree.

Sold in Pints, Half-Pints, and Quarter Pints, in Bottles, secured by their Stamps, by

BEWLEY, HAMILTON, AND CO.,
(Late Bewley and Evans),
STATE APOTHECARIES,
3 AND 4, LOWER SACKVILLE-STREET, DUBLIN.

BEWLEY, HAMILTON AND CO.'S

ÆRATED WATER OF

BROMIDE OF POTASSIUM,

(As suggested by Sir James Y. Simpson, Bart., Edinburgh.)

No. 1	Contains in each half-pint	5 grs.

PREPARED BY

BEWLEY, HAMILTON & CO.,

STATE APOTHECARIES,

3 & 4, LOWER SACKVILLE STREET, DUBLIN.

To those who value PURITY and INTEGRITY in Pharmaceutical Preparations—the following, a TRUE CITRATE OF MAGNESIA, is recommended—the POPULAR Citrate being of a grossly FICTITIOUS nature.

EVANS' PURE SACCHARATED EFFERVESCING CITRATE OF MAGNESIA.

IT is well-known that the popular article, improperly called "Granulated Effervescing Citrate of Magnesia," generally contains no Citrate of Magnesia. Several samples, submitted to analysis, proved them to consist mainly of Carbonates of Soda and Potash, Tartaric and Citric Acids, and (in some samples) Epsom Salts, each of the preparations examined being made from a different formula. This genuine Saccharated Citrate of Magnesia is introduced in order to secure for this valuable medicine a uniform preparation of definite therapeutic value. It has a more agreeable flavour than the fictitious article, is a cooling and mild aperient, whilst the Carbonic Acid evolved during its effervescence is a valuabe constituent in soothing irritation of the stomach. It will keep well, if preserved free from moisture.

Examination of Effervescing Citrate of Magnesia, from Dr. EVANS, Dawson-street, 31st October, 1867.

This Preparation contains the Element of:—				*Or, when in Solution, the Composition is:—*	
72·3	per cent. of	...	Citrate of Magnesia.	Citrate of Magnesia	83·68
13·6	,,	...	Carbonic Acid.	Sugar	15·75
13·6	,,	...	Sugar.	Moisture	·57
·5	,,	...	Moisture.		100·
100·					

It is perfectly free from Sulphate of Magnesia,
C. N. C. TICHBORNE, F.C.E., &c.

MEDICAL ESTABLISHMENT, 49, DAWSON-STREET, DUBLIN.

Sold also by all Medical Halls: Grattan and Co., Belfast. Bourke and Co., Limerick.

EVANS' COD-LIVER OIL,

NOT ONLY GENUINE BUT PURE, AND NEARLY TASTELESS.

Obtained at a low temperature from livers whilst perfectly fresh.
Agent for Hoff's Malt Extract.

TO THE MEDICAL PROFESSION.

George Oldham and Co., Pharmaceutical Chemists and Apothecaries, take this opportunity to return their grateful acknowledgments to the Profession for the support they have hitherto received, and which they will regard as a fresh motive for exertion. Abstaining, either THEMSELVES or their ASSISTANTS, altogether from VISITING or PRESCRIBING, except for the application of Leeches, Cupping, or such operations as are performed under MEDICAL ADVICE, they will continue to devote themselves exclusively to the duties of the pure Pharmacien.

Having had much experience in Practical Pharmacy, sparing neither trouble nor expense to have every article of superior quality, and exercising scrupulous care and attention in the preparation of the various Medical and Chemical Simples and Compounds, the Faculty may place perfect reliance upon the purity of the ingredients employed, and realize from their administration and use the anticipated effects.

☞ Medicines delivered by Vans in all parts of the City and Suburbs, and along the line of the Kingstown and Bray Railway, and in the vicinity of all the Stations, at any hour, free of charge.

Surgical Instruments and Appliances; Home and Foreign Mineral Waters; also every Drug, Chemical, and Pharmaceutical Preparation in use. MEDICAL HALLS,

107, GRAFTON-STREET, 64, DAME-STREET, AND
1, RATHMINES-TERRACE, RATHMINES.

Original Communications.

CLINICAL LECTURE ON CASES OF MENINGITIS.

By C. HANDFIELD JONES, M.B.Cantab., F.R.S.
PHYSICIAN TO ST. MARY'S HOSPITAL.

MENINGITIS not depending on tuberculosis or local injury is certainly somewhat a rare event in hospital practice. I avail myself, therefore, of the opportunity which has recently occurred to draw your attention to this malady, and I am the more disposed to invite you to join with me in considering the subject, as an affection of this kind has recently prevailed epidemically on the Continent and in Ireland, and may very possibly be met with here some day :—

Before I proceed to the details of our cases, let me recall to your minds some of the principle features of the disease. (1.) As to its *morbid anatomy*. The seat of the inflammatory effusion in most cases is the pia mater, and the deep surface of the visceral arachnoid. Hence it follows that the grey cortical matter of the hemispheres must be seriously affected in every instance of extensive meningitis, as it is impossible that the delicate cell-growth of the nervous centre can maintain its normal nutrition, while the vascular woof from which its nutrient vessels proceed is inflamed and infiltrated with fibrinous and puriform effusion. Mere serous effusion in this situation is of course no sign of inflammation. (2). The *symptoms* of meningitis are very much what you might expect from your knowledge of its morbid anatomy, pain in the head, delirium, coma, convulsions, paralysis in various grades and modifications. Of these and their associates, pain, irritability, restlessness, delirium, strabismus, and vomiting, are the earlier; and unconsciousness, palsy, and anæsthesia, the later phenomena. Yet, there is great variability in this respect, and, as in the cases I shall relate to you, and one detailed in the manual of "Pathology" by Dr. Sieveking, unconsciousness may set in almost suddenly and unexpectedly. (3.) As to its *causes*. Exposure to solar heat, aural disease, the poison of the exanthemata, those of typhus and malarious fever, and as it now seems that of influenza, are those which you are most likely to meet with. You will remember my stating to you in the systematic lectures that it was not yet fully ascertained whether epidemic cerebro-spinal meningitis was *au fond* typhus fever with unusual cerebral and spinal complications, or a disease *sui generis*. There is no doubt that the occurrence of meningitis is a very marked feature of some typhus epidemics, but, though we may be ready to admit a certain relation of the disorder in question to typhus, I am very doubtful as to the correctness of the conclusion, that it is the same and nothing more. I rather believe that the truth is, that typhus shades off and passes by transitional instances into various maladies, which are usually regarded as more or less completely identical with common inflammation ; of which meningitis, pneumonia, and dysentery may be mentioned as examples.

Case 1.—S. B., æt. 64, admitted March 8th, 1867. She is a thin, rather tall person; states that she has been ill eight weeks, and laid up three, during which latter period she has had much vomiting and purging, all food being rejected directly. At first she had a bad cold, with much cough and expectoration. At present she feels very sick, with a sour, bad taste in her mouth ; her tongue is a good deal coated; diarrhœa has ceased the last three days; pulse 94, weakish ; urine very high coloured. Very thirsty ; no appetite. Coughs a good deal, and expectorates thick matter. Sleep disturbed by cough. No marked physical signs in chest. Heart's sounds normal. ℞ Acidi nitrici ℥ iij. + spt. æth. chlor. ℥ x + acid hydrocy. dil. ℥ iv. + tr. calumb. ℥ x. + aq. ℥i. *ter die.*

10th.—Sherry, 5 oz. Urine of 9th pale, sp. gr. 1019, not albuminous, thick with lithates.

12th.—Adde mist. quin. disulph. gr. iss.

16th.—Doing very well ; tongue is nearly quite clean ; good breathing all through both backs. She went on well for a week. On

24th.—After having been to chapel in the hospital in the evening, she got shivering, succeeded by fever, and this by vomiting. The next day I found the sickness was less, the appetite was lost, there was much thirst, and a coated tongue; temperature 103°·2; pulse 105, very weak. Breathing full and good in all right lung; in left it was everywhere more or less weak, but there were no morbid sounds. The sherry was increased to 8 oz. ; effervescing ammoniated saline, with 4 grains of ammonia in excess, ordered 4tis horis.

26th.—Pulse 90, weak. Hands feel tolerably cool. Bowels rather relaxed. Temp. 100°·4.

27th.—Is very weak. Pulse very feeble, 108 ; had a good night ; is a little flighty to-day ; cough quieted by pills of Indian hemp ; temp. 99°·68. Brandy, 6 oz. Acidi nitrici ℥ 3 + quinæ disulph. gr. ij. + spt. æth. chlor. ℥ x. + aq. ℥i. *quater die.*

28th.—Was quiet during the night, but became very thirsty this morning, and since noon has become quite excited and delirious, rolling her head constantly from side to side, moaning, and quite unconscious. All the afternoon she had vomiting, and much nausea this morning. Breathing weak, but without rales, in both backs. T. 103°·28 ; pupils of medium size ; pulse 120, of good size, not very weak. Tr. opii ℥ 50 in enemate statim.

29th.—Was quieter after the enema. She appeared better from 7 to 10·30 P.M. of last night, after which she became rapidly worse, more delirious and sinking. At present (2½ P.M) appears moribund ; head is thrown back at each inspiration ; the expiration is moaning ; there is tracheal rale ; pulse very weak, 130 ; quite unconscious ; had a second opiate injection at 8·30 P.M. yesterday, and has taken brandy pretty freely. Died at 4 P.M.

Post-mortem.—Brain was healthy in texture, but there was well-marked seropurulent effusion in the pia mater of the anterior and upper part of both hemispheres, and of the cerebellum and pons and median excavation of the base. The posterior cerebral lobes were comparatively unaffected. There was no fluid in the ventricles, nor any other disease of the brain than the meningitis. The lungs were healthy, except some pneumonic congestion of recent date. The heart was small. Two of the semi-lunar valves of the aortic orifice were atheromatous, and bulged into aneurismal pouches. Liver normal. Spleen very large, weighed 17 oz. It was so rotten that it would hardly bear handling. The bladder contained a good deal of urine, which was turbid with lithates, of sp. gr. 1021 ; contained no sugar. Kidneys slightly granular on surface, one contained a fibrinous deposit.

There can be no doubt that the malady with which this patient was suffering when she was admitted was influenzal catarrh. Both the great mucous tracts were severely affected, or rather had been, for the intensity of the disorder had somewhat subsided when she came under our observation. The tongue was much coated, and I took occasion to remark that you would have an opportunity of observing how this coating would clear away under the use of nitric acid and light tonics, without the administration of a particle of mercury. A foul tongue, I told you, might depend on hepatic derangement, but perhaps, more often than otherwise did not. I stated that what it implied in all cases, except where stomatitis exists, was catarrhal disorder of the mucous membrane of the stomach, which very commonly occurs as a primary affection. Of course obstruction to the portal circulation, which must necessarily result from imperfect secretion of bile, will aggravate materially a catarrhal condition of the gastric mucous membrane, but it is nevertheless certain that very positive evidence of hepatic derangement may exist, together with a clean tongue and a well-digesting stomach. This I have noticed particularly in jaundice. Do not, therefore, be too ready to give blue pill, or the like, when you see a foul tongue ; they are depressing agents, and may, if given inappropriately, be hurtful rather than beneficial. At the

same time, do not withhold them when they are really called for. I remember very well a bad case of severe rheumatic pericarditis and pleurisy in an extremely asthenic female, whose appetite and digestion were in a very unsatisfactory state, and whose condition was sufficiently disquieting. I had foreborne the administration of calomel (that well-proved but much abused remedy) for fear it might depress her still further, but at last, seeing that no ground was gained, I ventured on a small dose, and the improvement which followed was most marked; she began to take food, and made a good recovery. The relapse which occurred was quite similar to the original attack—there was the same prostration, vomiting, coated tongue, and bronchial affection, with pyrexia. This subsided again; the temperature fell from 103°3 on the 25th, to 99°68 on the 27th, and there appeared no reason to apprehend anything worse than a somewhat tedious convalescence on account of her great weakness. The next day, however, a new scene opened—the temperature rose again to 103°3, the pulse was 120, and apparently stronger than it had been two days before; there was delirium and unconsciousness. These symptoms continued, and she died in about twenty-eight hours from their first appearance. The autopsy disclosed the existence of a rather rare affection — simple meningitis, by this term implying, that the inflammation of the pia mater was of a non-specific kind, and not dependent on, or associated with, the presence of miliary tubercles in this membrane. As far as our evidence extends, there seems to me no reason for regarding the intra-crannial inflammation in this instance as having any other causation than those of the intra-thoracic or abdominal viscera, which were evidently of atmospheric origin. The fibrinous infarctum in the left kidney was most probably connected causatively with the diseased state of the aortic valves, and had no relation to the meningitis. There need be no suspicion that the second febrile attack was one of typhus, not only because there was no eruption, and the aspect of the condition was very unlike that of low fever, but especially because the temperature fell on the third day to the normal figure, and rose again considerably when the intra-cranial inflammation was established. Typhus may certainly give rise to meningitis, but we may safely exclude it from all concernment here. The autopsy sufficiently explains the delirium and unconsciousness by showing us that the organs of the intellectual actions were gravely and extensively affected by the inflammation. This explanation will not, however, apply to all instances where the symptoms are very similar, as Andral has very clearly shown. I will defer some further remarks on this head, as well as on that of treatment, till I have narrated to you another case.

Case 2.—The subject of this is a man, æt. 57, whom I was asked to see in consultation at ten P.M., February 10. His regular medical attendant told me that he had been under his observation about fifteen years, and that he had never presented any signs of renal disease, though the urine did not seem to have been particularly examined. For several years he had been deaf with discharge from the ears; and some two years ago he had had an epileptic fit, or something like it. He had been depressed in spirits recently, and had felt a presentiment that his end was approaching. The day before I saw him he had been taken ill with severe pain in both ears, for which leeches were applied with relief. Pus and blood were seen to escape from the left auditory meatus. When he was visited at ten A.M. the following day, he was sitting up in bed, cheerful, free from pain, and was reading the newspaper. Two hours later pain came on again, and a dose of calomel was given. He was quite conscious at four P.M. I found him perfectly unconscious at my visit, restless and struggling; no paralysis; the pupils fixed; the pulse tolerably strong and regular. Before I left the house he had a well-marked paroxysm of convulsions. At mid-night he was pulseless, or nearly so, with tracheal rale, wholly insensible, and died in the course of a few minutes. The convulsion had not recurred.

Post-mortem examination on 13th.—Head only examined; the veins of the posterior part of both hemispheres were full of dark blood; the cerebral membranes were everywhere healthy, except at the anterior part of the circumferential region of the cerebellum on the left side, where it lies adjacent to the posterior surface of the petrous bone; here the arachnoid was smeared over with a small amount of puriform fluid, and the tissue appeared to be unduly red. The dura mater lining the spheno-occipital basilar groove was darkened and discoloured, and there was turbid darkish serum in the occipital fossæ, welling up out of the spinal canal. The dura mater lining the petrous bone did not appear altered, and we could not find any disease of these bones on their inner surface. The encephalon everywhere appeared normal.

This case contrasts with the preceding in the much shorter space of time during which manifest symptoms of cerebral disease existed, and in the much smaller amount of meningitis discovered by the autopsy. In fact, I think it cannot but excite your surprise that so grave and rapidly fatal symptoms should have resulted from such a small amount of lesion. I am speaking, of course, of the recent inflammatory mischief, for, with regard to the old standing disease in the tympanic cavities, there seems no reason to think that the brain resented its presence on the last day of life any more than it did on the day previous. On reflection, it will appear evident to you that so small a focus of disease could not possibly produce the symptoms which existed by the injury which it inflicted on the *tissue* of the organs whose functions were abolished. A small patch of inflamed arachnoid, covering a part of the cerebellum, could not give rise to delirium, unconsciousness, and fatal convulsions by its local influence, for these phenomena are not produced by simple removal or irritation of the cerebellum. No doubt the local mischief evoked the phenomena by *the irritation* which it exerted on the hemispheres and the excitable districts, acting, in fact, just in the same way as a wandering wisdom tooth, a tænia in the intestines, or any other extra cranial cause might have done. Dr. Brown Séquard has forcibly advocated this view in some of his published lectures. He says—"An irritation starting from the part inflamed in the brain, like an irritation from the various membranes and viscera, may act upon some other part of the encephalon, producing there some peculiar kind of alteration which causes either paralysis, anæsthesia, delirium, insanity, epilepsy, &c." Andral, long before, in his "Clinique Medicale," expressed an opinion nearly to the same effect. His words are, "The different facts which have now been analysed lead to a singular conclusion—viz., that with similar lesions of structure in the dead body, the most varied disturbances in the power of motion are found to coincide; in the greater number of cases, whether there has been convulsion or paralysis, the structural lesion after death will be the same. Thus, beyond that lesion which the scalpel points out as having its seat in the membranes of the brain, there is in the brain itself a modification not recognisable by the anatomist, which is produced to be sure by the lesion of the membrane, but which, variable in each individual, is the real cause of all the functional disturbances which are seen to supervene." Again, "in those cases where the disturbance of the intelligence depends on an affection of the meninges, the cause of this disturbance can no more be referred to any specific alteration, than that of motion or sensation can, and the diversity of the lesions of intelligence, as well as those of sensation and motion, can only be accounted for by referring it to the different susceptibility of the brain to impressions," p. 55, 59. I think these quotations clearly show that Andral was quite aware that many of the phenomena of meningitis were the result, not of a direct local action on the cerebral tissue adjacent to the inflamed membrane, but of a morbid impression conveyed to parts of the brain remote from the focus of disease, and that the effects produced varied in different instances according to the degree in which the irritation was resented by the nervous tissue.

Accepting, then, these views of Brown Séquard and Andral as correct, I proceed to justify to you the treatment pursued in the first case—viz., the administration of opium. At first sight it sounds preposterous to give a patient who is lying in a semi comatose condition a drug which in toxic doses produces fatal coma itself. But, first, it is not proposed to give opium in toxic doses; secondly, opium is an approved remedy in some inflammations, as in peritonitis, and checks exudation, as it plainly does in intestinal catarrh, and it is therefore conceivable that it may benefit the meningitis; and thirdly, as there is reason to regard the fatal coma and asthenia, as depending in many instances on irritation conveyed to the respiratory and cardiac centres from the inflamed membranes, a drug which should render the nervous tissue less impressionable might be of great service. In our first case I do not think there is any evidence that the fatal event was accelerated by the opium, death did not occur until nineteen hours after the second enema. Perhaps, however, smaller and more frequent doses might have had a better effect. In the second case no opium was given, but I cannot help thinking that subcutaneous injection might have proved serviceable. It is tolerably evident that the unconsciousness and convulsions were dependent on irritation, and if the nerve tissue could have had its undue susceptibility blunted, things might have gone better. The great fatality of meningitis, under ordinary methods of treatment, justifies, I think, a resort to the means proposed in cases which appear suitable. The points which I should regard as indicative of the probable utility of opium are, predominance of nervous disorder, the phenomena setting in with suddenness and severity, absence of marked hyperæmia of the head, weakness of pulse, and a general asthenic condition. In the following case, which I proceed to narrate, where stupor was a marked feature, small doses of opium were given for several days, at least without any ill effect.

Case 3.—M. G., æt. 21, female, admitted April 1st, 1867. She is an errand girl; her mistress states that when first attacked, three days ago, she was convulsed in the face, and suddenly became stuporous; she had been ailing some good while with colds and cough. After she recovered she told us that she remembered being very sick at breakfast time on March 30th, that she went to a doctor's, who gave her pills and castor oil, and desired her to go to bed immediately, which she did, after which all was a blank till she found herself in the hospital. When I saw her, I noted that she was very stuporous and drowsy, could with difficulty be roused or made to comprehend. She put her hand to her left side as if she had pain there. The expression of her face was bewildered (attonitus); no eruption on abdomen, no ilio-cœceal tenderness; tolerably good resonance in both backs, no morbid sounds, breathing weak; tongue clean, and tolerably moist; eyes fairly clear, pupils of medium size. Temperature 98°24; pulse 88, weakish, irregular occasionally; respiration 18; lips pallid. S. diet, beef-tea, milk. Camphoræ gr. i. + pil. hydr. gr. ij. + opii. gr. ¼ in pil. *quater die.*

2nd.—Passes everything in bed, is continually drowsy and stuporous, but seems a little more conscious, shows her tongue on being pressed to do so. Temperature 99°5; pulse 70, of good volume.

4th.—Pulse 87, regular, soft; tongue more dry and coated; no eruption; urine copious, sp. gr. 1030, full coloured, not albuminous, nitric acid throws down lithates quickly. Temperature 100°4; is much more conscious.

5th.—Still very drowsy, evacuations still passed in bed; has spoken when questioned, says she has no pain; sighs at times, generally when waking up; no salivation. Pulse 90, of fair force; tongue red, cracked, not very dry. Pl. c. pil.—pot. iodidi. gr. iv. + ammon carb. gr. iij. + decoct. cinch. ℥i. *quater die.*

6th.—Keeps taking the blister off when she feels it stinging; much stupor still; pulse 75, of good force. Temperature, 99°68.

7th.—Is quite awake and conscious; blister has risen well since last evening, and she has been better since. Temperature 99°32; pulse 110; gums red and swelled; bowels open very frequently this morning; omitte pil.

10th.—Doing well, quite conscious. Chop, port wine 3oz. From this date her recovery went on almost without a check, the dose of pot. iod. being at first diminished, and the mixture changed after ten days for mist. quinæ. + syr. ferri. iodid. She left the hospital quite well May 12th.

Much uncertainty must exist as to the true nature of this case, but I incline to consider it one of limited meningitis. I ground this opinion more on the quality of the pulse, the state of the urine, and the apparent good effects of the mercurial and blister, than on the direct cerebral symptoms—the vomiting, facial convulsion, and unconsciousness. These might have been the result of a 'coup' of influenza, but then there would have existed signs of general prostration, and the remedies employed would probably have proved injurious. At the same time the inflammation could not have been extensive, or the temperature would have been more elevated. I feel, however, that cases of this kind very often present the most exceeding difficulty in diagnosis, and this not only in determining what kind of organic disease may be present, but whether any at all exist. Of this I intend shortly to offer you some proofs.

A PAPER ON PYTHOGENIC OR ENTERIC FEVER,

IN WHICH IT IS ATTEMPTED TO DISPROVE ITS COMMUNICABILITY OR IDENTITY WITH TYPHUS.

By W. ST. JOHN COLEMAN, L.R.C.P., L.R.C.S.I.,

MEDICAL OFFICER MILTOWN-MALBAY DISPENSARY DISTRICT, FORMERLY CLINICAL CLERK MERCER'S AND SIR PATRICK DUN'S HOSPITALS, DUBLIN.

To whatever pitch of excellence it is intended that "Pathological Anatomy" should elevate the science of Medicine, it can never be competent to it to detract from the value of clinical observation, or usurp its functions in the study or treatment of disease. We may demonstrate the locale of a poison in the system, be aware of its nature, and thereby discover the manner of induction; but we cannot lay down fixed rules for the exhibition of certain states, their continuance, or result. It is well to know that certain pathological conditions produce the same diseased phenomena, and may be for this concurrence of circumstances referrible to the same "type." That a long train of diseased states, irreconcilable, we take it for granted, in their minutiæ—many of them, at least—present still characteristics enough in common to be classed as a "whole," differing in the development of one or other of the symptoms. It must be conceded, however, that climate, constitution, and treatment have not a little to do with changes in the admittedly same disease. The description of a diseased state as it presented itself to observers in other countries is only recognizable as agreeing in some—it may be the majority—of its symptoms with an identical state in this. The remarkable differences presented by patients at the same time and place, is common to the observation of all; and that treatment has its influences on the suppression or development of symptoms is not likely to be denied. There are diseases, too, which, more than others, are liable to the influence of circumstances. Epidemic diseases. And these, too, are capable of subdivision with respect to the regularity or otherwise with which they may be reconciled to any one "description." It must be admitted to the subject of this paper the first place in a category such as is provided here. Not only in the difference of "descriptions" of it, in the histories of its advents, or the manner of its origin and spread, far more than this, its character, whether contagious or otherwise, is matter of dispute, while, further, *its individuality is denied.* Considering the many authorities calculated to adjudicate, and the immense amount of information ready to be brought to bear upon the vexed questions of "fevers," I should be slow to obtrude any opinions of mine; but as it is ad-

mitted to every man his right of individual observation and decision respecting the matters, of all others with which he comes in contact, it may be permitted me to record the inferences deducible from the treatment of nearly 200 cases of fever of the enteric or typhoid type. I, thus at the outset declaring myself as coinciding with the class who believe in the non-identity of the two great types of continued fevers, claim credit, nevertheless, for the impartiality with which I studied the cases recorded here. Setting aside the principles instilled in me by education and earlier observation, I did not enter the field of disease culling those phenomena which coincided with my opinion, or which flattered the prejudices of class.

OF THE LOCALITY IN WHICH THE FEVER APPEARED.

Consisting of upwards of 35,000 acres, my district stretches for five or six miles along the Western coast of Clare, hill and bog alternating the surface inland. The seaboard is bold and rocky, indented here and there by sandy-bottomed bays and creeks. The level is high above the sea, while the character of the soil is moor, sandy gravel, and clay. Two or three small rivers flow from the mountains, situated about midway in the district, towards the sea, and many more varying in size, and dependent on the season, run into the many lakes that stud its eastern portion. The village with which we have more particularly to do lies about a mile and a-half from the shore, at the watering-place of Spanish Point. Its population is about 1400, while that of the entire district may be estimated as between 10,000 and 11,000. There are no manufactures, the population, with the exception of the villagers, being entirely agricultural ; and this leads me to speak of a matter of no little moment as considering health. A chief manure for their fields, and the moors that yearly are happily becoming gardens, is the sea-weed thrown in much profusion on the shore. In this there is daily traffic, and the potato, their staple food, must be deeply impregnated with matter that contributes so largely and generally to its growth. Here we have little or no scrofula, no enlarged glands or ulcerated necks ; the affections of the chest are mostly bronchitic, phthisis being, happily, very rare. The inference is pertinent—Is it that the iodine contained in the sea-weed is absorbed by the frequent intercourse, or from the food? But to return. A small stream at one end of the town contributes but slightly to drain it, and *the sewerage is ineffectual and deficient.*

OF THE ADVENT OF THE FEVER.

The month of April, 1865—an unusually warm one—found my district free from diseases of the zymotic type, but in a little while powerful influences to diseased states came into play. Manures, the collective refuse of preceding months, became needed for agricultural purposes. Dung heaps were removed—yards cleaned out—drains opened up. I cannot deny myself the satisfaction of looking back upon my reports to the Committee of Management of my district at this time. Alive to every probability, I could not but deduce from the foregoing state of things, but that typhoid fever was likely to presume. On the 21st of April, I saw E—— S——, of Sandymount, two miles distant from the village, in the early stage of enteric fever, and the same evening, three children of one family were prostrated by gastric fever in the village itself. The first named patient was a "dealer," whose avocations necessitated her spending a portion of her time in the village daily. Next day, E. H., aged 36, Flagroad and a policeman succumbed.

The Relief Register, in which is entered the names of all patients attending at dispensary, or visited at their homes, bears an increasing ratio after this date. Of the vast majority common to the village, its surroundings nevertheless, suffered also ; whilst individual cases continued to occur throughout the district, independent of local connection or distance from the original source of disease. Under the different headings hereinafter assumed, those individual instances are freely illustrated.

OF THE CAUSE.

That defective sanitary arrangements lay at the bottom of this there is no doubt. They were only too plain at the time. Yards in which the heaped up "refuse" impeded effectually the hitherto sluggish sewerage, drains open only on their superficial aspect for the readier emanation of effluvia ; wells, favouring by their low situation, the determination of liquid contamination, whilst the avenues leading to them, from their occasional loneliness, favoured the deposition of animal and other filth.

So far for causes predisposing—the exciting ones are rampant enough in the dissolving showers and suns of April. Strange suns for such a season they were too. They played upon the collected refuse till the showers were expelled again in vapour—vapour surcharged with every element of putrefaction and disease. The observations referring to "drains," common to yards and houses, are equally applicable to the main sewers of the village. Subsequent examination demonstrated this to a pitch beyond surmise. *The covering flags of most of the principle drains, rested upon the mud and refuse matter, with which they were choked.* Transit through them of any matter, solid or liquid, was impossible, and the yards held the obnoxious material it was intended the sewers should convey. The unusually warm suns of April, 1865, had excellent basis of operation here, and the campaign against health, which naturally followed, was commensurate with the material so supplied.

First of all, the children were attacked. Gastric fever became rapidly prevalent at the "Chapel end" of the town. The juvenile members, three in number of one family, were prostrated on the 21st, and four days following a similar number in a house opposite succumbed. Others in the immediate locality followed. Now, in and about these houses, the sanitary arrangements were wretched, *and there are no main sewers in the vicinity.*

Among the adult population, and of these, more especially the females, fever of the pythogenic type very shortly after this obtained, nor was it until it was established a week or ten days, that the men and "grown up" boys were subjected to its influence. The case of the policeman, be it admitted, is an exception to this as a rule.

I wish here to account for the order of invasion in the manner which appears most plausible to me.

I hold that the children succumbed first, because of their more intimate connection with the diseased source.

Their mothers and sisters came next. Domestic duties chained them to the vicinity of disease. Their daily avocations necessitated proximity to these "heaps" and "fetid pools," and for them was no counter-balancing influence of healthy exercise and air.

These observations point to the reason why, in my opinion, the adult male members of the families enjoyed, so far, an immunity from disease. Subjected to poisonous influence for but little more than the period allotted to sleep (worst of all times admittedly), they enjoyed, for the remainder of the twenty-four hours, active healthy employment in the open gardens and fields. They ate too of the choice and staple portion of the family daily meals—picked out with rare unselfishness for them whose labours had supplied it.

But the little ones grew ill, and the mothers after them. The defective sanitary arrangements of the yards and sewers obtained also on the cabin floors. The tired labourer sat no more at the fireside, which a helpmate's hands had hitherto made cheerful for his coming. His children argued no longer their daily quarrels on and about the father's knee. Forced to become their nurse now, not only was his healthy occupation denied him, but the emoluments consequent upon it cut off ; while with no means to buy, it grew less in quality as well as quantity, his daily food ; and thus, subjected to the increasing influences of the poison, he became hourly less able to combat it, until at last, the balance betwixt disease and health declared in favour of the former, and he too went down.

I write of matters lively in my recollection now. I have

no need of reference to my "case-book" for particulars of cases illustrating instances like these. I sat one summer's evening in a cabin up the mountains, where the father lay delirious. Four of his children lay in different positions, likewise "fever stricken," whilst the fifth, an infant, tugged at the lank breast of the mother, who, herself, in the height of the disease, endeavoured unsuccessfully, to battle with it for their sakes. This woman's brothers looked through the open doorway at her, from a distance, but would not cross the threshold to keep down her delirious husband, or moisten her own parched lips. I am asked to believe that this fever and typhus are identical. Now, I submit, that here were circumstances most favourable to the development of the latter, and they never supervened. It has been my fortune, further, to have seen cases of enteric fever in almost every phase of life, under circumstances the most favourable as well as the most adverse, whose wretchedness and poverty were as well-marked, as in any instance of which I have ever heard or read, and yet I never met a case in which the symptoms partook of those characteristic of typhus. Enteric fever never passed into typhus, even where the agents, admitted to favour the production of this latter, were rife.

The disease continued to infest the village during the months of May and June. In July the numbers were but few; but early in August it again became very prevalent, and active sanitary arrangements had to be instituted for its arrest. The committee of management, with a small sum afforded by the guardians, proceeded to whitewash all the cabins of the poor. This sum, however, being insufficient, was speedily supplemented by a general subscription, and the sanitary measures, so far, completed. The houses and yards were rigidly inspected, objectionable matter removed; some sewers opened and cleaned, and lime plentifully distributed in disinfection. The fever now markedly abated, and though isolated instances continued to occur during the following two or three months, the disease, as endemic, may be said to have ceased early in September. And here it will scarcely be considered out of place to say something of sanitary arrangements subsequently, in fact recently adopted. They have bearing upon this paper, albeit the proof afforded be but negative. I spoke of the sewerage as not only "ineffectual," but "deficient," and statements which have in the meantime intervened refer more particularly to this. Actual examination of each of the main sewers demonstrated the same disagreeable fact. Semi-solid jelly-like material filled all of them, even unto the covering-flag, and rendered them as passages perfectly useless. It was evident that simply cleansing them only left it a matter of time for the "blocking-up" to maintain. Absolute flushing could only be depended on, and "flushing" was, fortunately, easily obtained. By continuing the sewers on either side of one street to a stream running at right angles with it, we have succeeded in bringing two streams of water, not only flushing it, but, following the course of the old sewers, again uniting, pour through the main outlet of the village into the meadows beyond. Two minor streams are similarly utilized, keeping continually permeated with water the sewers in their respective streets. We remember the epidemics of the preceding winters—only similar in their virulence and general diffusion; but we stand over one of our street gratings, and, seeing the bubbling, leaping waters as they rush through the sewer below, cannot fail to be reminded that fever, scarlatina—that zymotic diseases of any kind are happily absent from us now.

OF AGE AND SEX.

Presuming to no regularity of arrangement, the data I have at various times culled from the treatment of enteric fever are placed in the order first noted down. I admit the many objections that must naturally attach to this, but I cannot hope for my paper that consideration which would have justified me in a more methodical arrangement of its contents.

I append a table of 73 cases, made note of in the earlier stages of the epidemic. I am satisfied that it is equally applicable to the cases which followed, if we except the preponderance of children under ten years:—

	Under 10 years.	Under 20 years.	Under 30 years.	Under 40 years.	Under 50 years.	Over 50 years.
Males ...	17	7	8	5	1	1
Females ...	7	12	3	5	2	4
	24	19	11	10	3	5

Thus, then, the cases under 10 years were most numerous, and of those the males more than the females. Those under 20 years come next in number, but the order between the sexes is altered, the females predominating. In the next number, that of those under 30, the order is again reversed; whilst of those under 40, they are upon an equality. More females than males suffered in the two ages that follow, and this is more markedly the case in those over 50 years. It will be remembered that the children were first attacked, and with gastric fever; and the foregoing table, being taken early in the epidemic, is, no doubt, influenced by this consideration. I can supplement it from conclusions drawn from the entries in the Medical Relief Register, and from my case-book; and these tend to show the great determination of the diseased state to attack—those ranging from 15 to 30 and 35 years.

I proceed now to adduce such evidence as appears to me definite, in disproving the contagious character of pythogenic or enteric fever, and, in support of this evidence, take leave to remind the reader of the circumstances under which I studied the disease. Those who know the arrangements of the cabins of the poorer classes in Ireland, and especially of those in the western and southern provinces, will be free to admit that in them are contained all the elements which would be likely to favour contagion. Undivided by partitions of any kind, in many instances, and in others, by such as are of a partial or temporary character, their low, ill-ventilated cabins, afford not only the people themselves a habitation, but alas! in many instances, their cattle, and still oftener, their pigs. The primitive arrangements of their beds, the "huddled together" manner in which they lie, but above all, the shutting out of that atmosphere so indispensable to healthy existence. The light transmitted, at the best of times, through the diminutive windows, is but meagre, but in the vast majority of instances, of which I am speaking, no rays whatever penetrate. Old hats, rags of clothing, straw or other material, supply the place of glass, and oft-times, stones and clay are used, to more effectually obliterate the original site of the window. The floor of the cabin is almost invariably under the level of the road. Commensurate with it, at one time, continual "sweeping," and the geological peregrinations of the pig, lowered it naturally enough below the original level, whilst its surface, moreover, became indented with superficial channels. Two or three different descriptions are applicable to the mode of arranging the beds—(1.) The "dresser" is placed some three or four feet from the end wall of the cabin, at right angles with the sides. Behind this, two beds are stowed away foot to foot, or head to head, as the case may be, ingress being had to each of them in an aperture left between the respective margins of the "dresser," and the side-walls of the house. (2.) The bed is covered over-head, and at all sides by thick close straw matting, save where an opening, some two feet by three, is allowed for ingress and egress. (3.) In others—the worst or rather most wretched cases—the beds are laid on boards or straw, placed on the ground, where the cattle, horses, pigs, are not inmates of the house. They are "housed" in the immediate vicinity, and the accumulated manure is invariably proximate. I speak, be it remembered, of the poorest cases, as in those, for the foregoing reasons, endemic diseased would be most likely to become contagious.

OF ISOLATED CASES.

E. H., etat. 38; married; was attacked by enteric fever, and came under my care on the 22nd April. A clean, tidy

little woman ; her cottage was airy and well kept ; the yard clean, and she and I were equally at a loss to account for the cause. Every symptom was well-marked. Diarrhœa, gurgling in right iliac fossa—rose coloured lenticular spots. After a tedious convalescence, she recovered. Her husband, children, and nurse, remained in the cottage throughout, and were never affected in any degree.

J. M. M., etat. 28, a policeman, under my care at the same time, exhibited the best marked rose spots I have ever seen. My friend, Doctor Cody, of the Army Medical Staff, advised his removal at the time, but despite his advice I continued him in the same sleeping apartment with five other men, during the whole course of the fever, and not one of them contracted the disease. This man experienced, eight days before, "a heavy sickening smell," whilst smoking in an open privy attached to the barrack.

B. C., etat. 30, a labourer, occupied the common apartment with his father and mother, wife and young family, yet, in the long course of an attack, in which the worst symptoms were prominent, he did not succeed in imparting to any of them the disease from which he suffered so severely himself. (See case of I. N.)

P. S., etat. 25, inhabited, with his father, mother, brother, and sister, a small cabin in the village. The bed in which he lay occupied fully one-third of the apartment of which this cabin was constituted ; and what with impoverished food, restless nights, broken sleep, snatched here and there on the floor, and a fever patient beside them, one is sadly puzzled to account for the immunity this family enjoyed, in the immediate proximity of a diseased state, *said to be contagious.*

Miss B., etat. 21, residing some three miles from the village. experienced whilst in it a sickening offensive smell. Ten or eleven days after, I saw her—well-marked lenticular rose spots over abdomen and chest ; diarrhœa, with gamboge coloured stools. Her sister, with whom she resided, has a large family, and was naturally anxious for their safety, her husband's, and her own. On my expressing my belief in the non-contagious character of her sister's disease, Mrs. M. nursed her throughout, and, although a continually passing agent from the sick-room to the household, she failed to contaminate herself, or any with whom she came in contact.

From my case-book, or the records attached to the Medical Register of the Dispensary, it were easy to multiply cases in which contagion, if it were possible, ought to have occurred. Under circumstances the most favourable to its development, it was subjected to test, and in no single instance, as far as the minute personal inspection I afforded to it is concerned, did it succeed. The fermentive character of typhoid stools as a propagative agent I claim to be exempted from this—for these, I concede at once, are eminently productive of the disease. I lay under contribution the following cases in proof :—

M. O'B., etat. 50, attended her two daughters in enteric fever for nearly three weeks. Proceeding to empty the bed-pan—*which had remained since morning*—in the evening, she was delayed doing so by parties passing the road. Whilst waiting, she inhaled an "awful" smell from the vessel ; sickened a few days after, in well-marked pythogenic fever, and died—attributing the cause to the bad smell on the 16th day.

P. O'N. (18), contracted typhoid fever, and was attended by his mother during the disease—his father and brother continuing in the next apartment. The mother was struck down when the boy was just able to leave his bed, but, she admitted to me, she had left the "pot" containing her son's diarrhœa stools for "two days and a night" in the room, and she felt "going down every day since."

J. N., etat. 20, a shoemaker, residing "three doors" below B. C., lay down in typhoid fever, a fortnight after the latter. No cause could be assigned for the advent of the disease in him. On examination of the "yard," I found the "top flag" of the sewer had been raised, just outside the door, and I knew that the stools passed by B. C. were thrown into this sewer higher up. The "flag" was replaced, and neither his father or mother, who occupied the apartment with him, contracted the fever.

THREE CASES OF "BLACK DEATH" OR "PURPURIC FEVER."

By T. B. RYAN, L.K.Q.C.P.I.

I BEG to forward particulars of three cases of the so-called "black death," or "black fever," that occurred in this neighbourhood, at a place called Ballyhoolahan, near Emly, in the family of a comfortable farmer. The farm house in which they occurred is surrounded by fields, a considerable distance from any other residence, and I could observe nothing about it to account for the disease.

The first case was that of Bridget Condon, æt. 11 months, who was taken ill about five or six o'clock A.M., on the morning of the 9th June, with purging and vomiting ; dark spots were observed all over the body, which led its parents to consider it a case of measles. The vomiting and purging continued until its death, which took place on the morning of the 11th, forty-eight hours after the first seizure. During illness the child passed water freely.

Immediately after death the greater part of the body assumed a dark colour, the face and hands remaining free from discolouration.

Case 2.—Mary Condon, æt. 2½ years, sister to Bridget Condon, was seized with illness on the evening of the 11th, at the hour of 6 o'clock P.M. She was affected with purging and vomiting, like her sister, which continued until her death on Thursday evening at seven o'clock P.M., 24 hours after its seizure.

These two cases were not seen during life by a medical man. The suddenness of them, and the unusual appearances immediately after death, thoroughly alarmed the parents ; and when the third case occurred, I was sent for as soon as they conveniently could. I arrived just in time to see the dead body of the second case, Mary Condon, before being shut up in its coffin. It was then I gathered from the parents the above details. About ten hours had elapsed since its death until I saw it ; the discolouration was intense, of a deep slate colour, and it prevailed very extensively over the body ; indeed, covered the greater part of it. The extremities of the fingers were of a bluish black colour.

Case 3.—James Condon, æt. 3½ years, took ill on Thursday night, 12th June, at the hour of twelve o'clock. Early next morning I was sent for. When I reached the house I found him lying in his mother's lap, in a state of stupor, from which he could be easily roused. On examining him, I found the conjunctiva much injected, but the pupils contracted readily with candle light. I could observe no spots on his skin, which was hot and dry. His face was flushed ; pulse 160 in the minute. His voice was natural, and he passes water freely. There were no convulsions nor any irregular action of muscles, such as spasms, &c. His mother stated that he was constantly falling into a state of stupor, from which he would be roused frequently by vomiting and purging. He raved a good deal.

As to the treatment, I felt rather at a loss what to do. It was plainly a case that could not afford to wait the time necessary to procure medicine from town, a distance of nine miles. I had, however, with me, fortunately, some aromatic spirit of ammonia and tincture of opium. I gave him immediately twelve drops of the former, and five drops of the latter, in sugar and water, and left a mixture of aromatic spirit of ammonia and water, to be adminstered to him at intervals, until medicine could be procured. I also ordered a teaspoonful of whisky, made into punch, with hot water and sugar, to be given every hour. I next soaked, in hot water, some broad calico bandages, and with these I enveloped his body, commencing at his feet, and reaching as high as his groin. I enveloped the abdomen and chest also in another wet bandage ; over these again, I applied others wet in the same way, and, over all, a few

turns of a dry bandage, in this way, making a sort of wet packing, taking care to leave the parts about the pelvis free, so as to leave a free escape for the evacuations. I had him then covered up in bed, and ordered for him the following mixture :—

℞ Acetatis plumbi grana octo.
Aceti destillat, ℥ss.
Tinct. Opii, ℥ss.
Syrup. croci, ℥ss.
Mist. camphoræ ad ℥ii. M.

St. cochleare unum minim quartis horis.

I ordered also a small blister to the nape of the neck, for four hours. Having directed this treatment, I left, fearing the next message would be one announcing his death.

14th June.—The next day I was glad to learn that he was somewhat better. I now substituted for his acetate of lead mixture, a mixture containing dilute sulphuric acid, camphorated tincture of opium, and chloric æther.

15th.—He was reported improving in every respect, and I had no further account of him until the 18th, when he was considered convalescent, the purging and vomiting having ceased, and the stupor and other head symptoms having also disappeared. The only thing that remained was some griping pain, for which I ordered a draught of castor oil and tincture of opium.

The wet packing, which had been kept up until now, I ordered to be discontinued.

There was no evidence of cerebro-spinal arachnitis in those cases—no convulsions—no stiffness of the muscles of the neck, &c., but there was evidence of passive congestion of the brain, as was shown by the injected conjunctiva—the stupor and incoherence. They presented not many points of resemblance to cholera—only the purging and vomiting. There was wanting the peculiar whispering voice of cholera.

The urine was secreted; the countenance had not the sunken aspect of cholera, and the skin, instead of being cold and clammy, was hot and dry. From my observation of those cases, I would say the disease is one *sin generis*. I think, too, that the cerebro-spinal meningitis, so frequently observed, is not an essential condition. At all events it was absent in those cases.

The spots on the skin, also, were present during life only in the first case; but, in the two fatal cases, the slate coloured patches were so numerous and so large immediately after death, that they formed a nearly continuous surface of disolouration.

How far the treatment I adopted in the third case contributed to the recovery I am not prepared to say. Certainly I would be inclined to adopt a similar treatment if I met with another such case, or a case of cholera.

The name of "Black Death," so much criticised, is not at all inappropriate, as indicating a too frequently fatal result, but a name that would indicate some pathological condition, would be more philosophical. Until, however, the exact pathology of the disease be better defined, it is just as good as any other.

PLACENTA PREVIA.

By Dr. JOSEPH DUGGAN.

EX-SENIOR SCHOLAR IN THERAPEUTICS AND PATHOLOGY, Q. C. G., LATE ASSISTANT SURGEON R. N., MEDICAL OFFICER TUOLOUGHMORE DISPENSARY CO. GALWAY.

THE subjoined case of placenta previa occurred in my dispensary district about a month ago. On the 11th of May last I was called in a hurry to see Mrs. G., of Waterdale, aged 40, in labour of her first child, at full time. The messenger stated she was very ill in labour for more than two days, and extremely weak from loss of blood. The latter being, in such cases, the harbinger of evil, I drove off at once to see her; she was lying on a bed near the fire, cold, exhausted, and almost pulseless, with troublesome jactitation of the limbs, and very much blanched from hæmorrhage, the part of the bed on which she lay was literally soaked with blood, her voice low and whispering, and the uterine pains weak and feeble. I immediately gave her a draught of aromatic spirits of ammonia, and tinct. lavand. co., with wine and other stimulants. After the lapse of a little time the pulse improved, and she slightly rallied; the jactitation, however, still continued, for which I gave her a draught of cloric ether and tinct. opii, which had a very good effect in checking it. Being somewhat restored by the stimulants, I proceeded to examine her. Owing to the external parts of the passage being very rigid and resisting, I had much difficulty, indeed, in passing my hand up the vagina, where, to my surprise, I felt a large fleshy mass hanging from the os uteri, the disc of the os was fully dilated, the head presenting, and the bag of the membranes protruded into the vagina. I knew instantly it was the placenta, the volume of the separated portion was nearly one-half—the remaining part still adhered to the neck of the uterus. From this I concluded that before labour set in, the placenta was attached round the superior zone of the cervix, right above the os, a perfect case of placenta previa centralis. The constant oozing of blood, and the great prostration, demanded imperatively immediate delivery. Without further delay I ruptured the membranes, the head placed in first position (Nægle), and rather low. I applied the forceps, and extracted a large well-nourished living (female) child, I then removed the placenta. The uterus, however, remained relaxed, and slight hæmorrhage ensued. I applied pressure with my hand, and cold over the uterus, without effect. At this perilous moment every drop of her blood was very precious to her, an enema of tinct. of ergot., and cold water was administered. I then introduced my hand into the womb and removed a large coagulum, uterine contraction followed, and the hæmorrhage ceased. By the diligent and judicious administration of restoratives, she miraculously made a very good recovery. I have visited her thrice since, and, considering the great loss of blood, she appears to be doing very well.

I regret not having taken notes of other cases of placenta previa that came under my treatment, where I had used the forceps with success; of course it cannot be employed in every case, but where at all practicable, I consider it the safest and most expeditious mode of delivery. Turning, though generally adopted indiscriminately, is liable to cause laceration of the vascular os uteri.

CASE OF STRANGULATED FEMORAL HERNIA IN A MALE;

COLLAPSE—OPERATION—RECOVERY.

By JOHN STUART VESEY, M.D., F.R.C.S.I., Etc.,

MAGHERAFELT UNION INFIRMARY.

HAVING read the account of two interesting cases of "Strangulated Inguinal Hernia," in THE MEDICAL PRESS AND CIRCULAR of 8th May, I think it right to give the following brief notes of a case of strangulated femoral hernia, I had some years ago. It may prove useful to some of the more junior members of the profession, showing that a case of strangulated hernia, to all appearance hopeless, may be relieved at the eleventh hour by operation. I look on it as an exceedingly rare recovery, never having seen in the Dublin Hospitals, or in my own practice, a case with such death-like symptoms to recover.

The following are the notes I inserted in the Record Book of Sickness and Mortality of the Magherafelt Union :—

I was called upon some years ago to see a poor itinerant, supposed to be dying in the last stage of typhus fever. On a minute examination, I found he was labouring under strangulated femoral hernia. As far as I could learn, he had been ill for *four* days, but I could not depend on this statement.

I tried the taxis but to no purpose. I had him removed at once to the Union Infirmary.

The man presented the following symptoms on admission,

he was in perfect collapse ; pulse could not be counted, so small and weak was it ; extremities cold ; eyes turned-up, dark areola under them ; face shrunk ; constant vomiting and hiccough ; complete constipation of the bowels ; abdomen enormously distended. He was perfectly insensible, and could not swallow.

I had a consultation on his case with two respected brother medical men, since dead. We agreed that the patient was to all appearance dying, and that he could not survive more than a few hours ; that the operation would not hurry his death, and that we were justified in giving him the chance, having very feeble hopes of success. I performed the operation by making a crucial incision over the hernia. Layer by layer the different faciæ were divided, till the intestine was exposed. It could not then be returned, so tightly was it strangulated. The stricture being very deep, there was great difficulty in dividing it. The intestine was on the border of mortification, and firm adhesions had formed between it and the sac. On the division of the stricture, the intestine was easily returned. The wound was brought together in the usual manner.

During the entire operation he acted like a madman, and required five persons to hold him.

He could not swallow anything for two days after the operation. The bowels were moved *twice* soon after the operation, and daily two and three times up to the fourth day, when a violent purging came on of black tar-like substance in profuse quantity, ten or twelve times on that day, with great prostration, and to all appearance the patient was dying.

On the fifth day he became slightly sensible, and the purging ceased. He could now swallow, so whiskey and wine were given in large quantity.

Daily he became clearer in his intellect, and stated that he remembered nothing about the operation, or his coming to hospital.

From the sixth day to the twentieth his bowels were often violently affected, but the evacuations were of a healthy colour.

At different times he was ordered pil opii, hydrarg. c. cretæ c. pulv. Doveri, enema amyli c. t. opii, wine, whiskey, arrow-root, beef-tea, &c.

The wound was poulticed and wet with infus. cinchonæ.

Four weeks after the operation the wound was almost healed. He sleeps well, and his appetite good ; no pain or uneasiness ; intellect perfectly clear.

After some short time he was discharged cured.

In about a year after he was admitted again into the infirmary, and died of dropsy, which arose from a diseased liver. He was 36 years of age, and of very intemperate habits.

Hospital Reports.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.

A LARGE ANEURISM OF THE RIGHT SUBCLAVIAN ARTERY, TREATED BY ACUPRESSURE ON THE FIRST STAGE OF THE AXILLARY ARTERY.

Under the care of Mr. PORTER,

SENIOR SURGEON TO THE HOSPITAL.

PATRICK G., aged 43 years, a labourer, was admitted into the Meath Hospital suffering from an aneurism of his right subclavian artery. The disease invaded the three stages of the vessel, and presented a tumour about the size of a large duck-egg above the clavicle, filling up the entire space between his collar-bone and the trapezius muscle. It pulsated strongly, had an elastic feel, and showed signs of thinning at one point. A loud *bruit de soufflet* was audible in it, extending also to the arch of his aorta. The external jugular vein was much distended above the swelling. He did not suffer from loss of voice or difficulty of breathing.

A second aneurism was discovered in his right femoral artery close to, and passing above, Poupart's ligament, towards the external iliac. He had no pain, but complained of numbness in his arm and hand. He appeared to be in excellent health, not in the least degree wasted, and his spirits were good.

He stated that the aneurism had made its appearance fourteen months previously, and had increased gradually in dimensions, until he entered another hospital in March last, where pressure on the tumour was had recourse to. This, he considered, caused the swelling to increase rapidly. As the subclavian aneurism was evidently thinning, and threatening soon to become diffused, or burst externally, Mr. Porter considered his a fair case to give him the chance (although unpromising) of a cure by occluding the artery on the distal side of the tumour. The disease prevented him securing the innominata, or the subclavian, in any of its stages. He therefore decided upon attempting to obliterate the aneurism by placing an acupressure needle under the axillary artery in its first stage for fifty hours. The general tendency to aneurism in his system induced Mr. Porter to prefer giving this mode of closing the vessel a trial, instead of throwing a ligature round it, which might, in the first instance, suddenly cut through the artery if diseased, or, when coming away, be followed by fatal hæmorrhage.

June 26th, 1867.—Mr. Porter laid bare the axillary artery in its first stage, after an external incision, four inches in length, extending in a curved direction inwards, from the junction of the deltoid with the greater pectoral muscle, and at a level of half an inch below the clavicle. He then isolated the artery with an aneurism needle, and passed a silver probe slightly bent beneath it, and bridged over the vessel with a loop of wire, after the manner of Sir James Simpson's *third* mode of acupressure. The tumour immediately became reduced one-third in size, and all pulsation in his brachial, and radial arteries ceased. The patient was then removed to bed, and a small bag of ice applied to the tumour.

28th.—The tumour is reduced very much in size ; the pulsation weaker, and the bruit in the aneurisn two-thirds shorter. The aortic bruit has almost disappeared.

Half-past three o'clock, P.M.—Mr. Porter removed the probe and wire, not a drop of blood followed.

29th.—The tumour is still smaller, and more firm.

Up to the time of receiving this report, the patient has gone on most favourably.

"AN ACCOUNT OF AN EPIDEMICAL PUTRID FEVER,

WHICH BROKE OUT AT KINSALE AND THE ADJACENT NEIGHBOURHOOD IN 1757, WITH PRACTICAL OBSERVATIONS THEREON." EDITED FROM THE MS. MEDICAL AND PHILOSOPHICAL MEMOIRS DEPOSITED IN THE LIBRARY OF THE KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

By T. W. BELCHER, M.D., Etc., Dublin,

FELLOW, CENSOR, AND HON.-LIBRARIAN OF THE COLLEGE, ETC. PHYSICIAN TO THE DISPENSARY FOR DISEASES OF THE SKIN.

WITH reference to the recent epidemic in Dublin, which, according to some of our best authorities, may be well called "purpuric fever," I think the following paper now published for the first time (so far as I am aware), may be read with advantage. It is printed (*verbatim, literatim, et punctatim,*) from the first volume of the Medical and Philosophical Memoirs. These memoirs consist of three MS. folio volumes, which are deposited in the Library of the College of Physicians, Dublin. They contain much curious and interesting matter, and give a fair idea of the state of our profession in Dublin one hundred years ago. Among the contributors are many well-known names, such as Smith, Rutty, Cleghorn, Fordyce, Barry, M'Bride, Croker King, Hill, Saunders, Purcell, Jebb, Moody, and Perceval. These memoirs end in the year 1784, but it is

said that the successors of that society still exist as a Dinner Club, to which the name "Philœsophageal" has been applied in joke. Respecting Dr. Nathaniel Barry, who read the following paper before the Medical and Philosophical Society on the 15th December, 1757, I may perhaps be permitted to reprint the following note from pp. 63-64 of my Memoir of Sir Patrick Dun, M.D. (Dublin, 1866) :—

"Afterwards Sir N. Barry. He was the only son, by his first wife, of Dr., afterwards Sir Edward Barry, Bart. Sir Edward graduated M.B. at Dublin on the 12th of February, 1739-40; and M.D. on the 8th of July in the same year. He was elected a Fellow of the College of Physicians on the 22nd of July, 1740, and was chosen President in 1749. In 1754 he was appointed Regius Professor of Physic in the University. He was also F.R.S., and Physician-General to the Army in Ireland. Removing to London, he was incorporated (probably) at Oxford on the 30th of June, 1761, on which day, according to the Catalogue of Oxford Graduates, he received a license to practise. In 1762 he became a Fellow of the London College of Physicians, was created a Baronet on the 6th of July, 1775, and died at Bath 29th March, 1776.—(See Munk's Roll of R. Coll. Phys., Lond.) His second wife was Jane, *d.* of Anthony Dopping, Bishop of Ossory, and by her he had three sons and two daughters. The baronetcy devolved on Nathaniel, above-mentioned. He was (probably) admitted *ad eundem*, at Dublin; was chosen Fellow of the College of Physicians on St. Luke's day, 1758, and President in 1767 and 1775. He married Catherine, *d.* of Walter Jones, of Headfort, Co. Leitrim, Esq.; and by her had an only child, Edward, who succeeded his father (who died in 1785), and died s. p. in France. Sir Edward (third baronet) was succeeded by his cousin Edward, *s.* of Rev. John Barry, Dean of Elphin. He also died s. p., and with him the title expired. The pedigree of this family is in Ulster's office, but the baronetcy does not appear to have been noticed by writers on these subjects. Sir Nathaniel is the only instance in which two baronets, father and son, were Presidents of the College of Physicians. A good portrait of him, by Gainsborough, presented by Sir Henry Marsh (second baronet), is in the College of Physicians."

Since I wrote the above note in 1866, I have reason to doubt that the portrait just named is that of Sir Nathaniel. I rather think that it must be one of his father, Sir Edward, if we may judge from the costume, which is that of a date anterior to Sir Nathaniel's time; while an undoubted likeness of Sir Nathaniel, now in possession of Dr. Banks of this city, is as unlike that in the College of Physicians as any two pictures can possibly be.

The following is the extract from the MS. referred to; and in reading it we must bear in mind that a century ago Irish *Hospital* practice was mostly confined to military surgeons, few other hospitals for the sick then existing in Ireland, except those supported by Government for the Army. At that period it was also usual, as it still is in some of our colonies, for military surgeons to engage in civil practice.

"Dr. Nat. Barry read the following Account of an Epidemical Putrid Fever, which broke out at Kinsale and the adjacent neighbourhood, with some new practical observations thereon, being an extract of a letter from Dr. Majoribanks Surgeon to the regiment of foot :—

AN ACCOUNT OF AN EPIDEMICAL FEVER AT KINGSALE.

In the month of May a fever was very frequent in this country, it first appeared in Kingsale among the town's people and soldiers, and we apprehended it took its rise from the jail, where the French prisoners were much crowded. Five grenadiers in our regiment were seized in one day, their first complaints were a violent head-ach, pain in the back, irregular shudderings, foul tongue and bad taste in the mouth, and a full quick pulse with great heat on the skin; the 2nd or 3rd day petechiæ, rather dusky than florid, appeared all over on some; on the breast, back, and arms on others: Their pulse fell, their countenance turned dusky, and the heat of their skin continued and it felt very dry, they did not complain much of thirst, though their tongue was dry, nor scarce indeed complained of any thing but want of sleep, though in appearance they dosed; from this time till about the 9th they turned more stupid, the pulse more sunk, and tho' at first costive, had now frequent thin fœtid stools, and no moisture on the skin. About the 9th or 10th day, they turned quite insensible, the pulse scarce to be felt at times, passed everything in bed, very hot smelling breath, and their mouths and tongues quite stuffed with a viscid, blackish slime which being adhesive and drawing from tooth to tooth, veiled as it were the mouth. A subsultus tendinum was generally perceived from the 8th day, involuntary fears and hiccup preceded death. Those that did recover, instead of turning quite insensible grew exceeding deaf about the 10th day, continued excessively weak for months, and indeed appeared scarcely animated.

On their being first seized, I prescribed bleeding, as they were all young, strong, and plethorick, and as the diseases of soldiers are generally of the inflammatory kind; but I repented afterwards of that evacuation, in any quantity performed, when the blood drawn, the sinking pulse, great weakness, and total inability to muscular motion, shewed the disease not to be sanguinary.

After V. S. I Puked with ipecacuanh. gave glysters and attempted to keep up the pulse with cordials, wine-whey for drink, plain red wine and blistering plasters, however, we lost two very fine soldiers.

In August, the same fever was preetty frequent in Kingsale, Cork, and Bandon, though milder at that time, and in those that I saw, without eruption. I was then called to a woman (Mrs. Dennis) in Kingsale in the 10th day of the fever, who had taken no advice, vinagar whey was her food, drink, and medicine. She was almost quite insensible; her eyes full, heavy, and inflamed; her pulse was very low, and not quick; her mouth, tongue and throat furred over in an extraordinary degree, and costive. I immediately ordered a glyster, proper cordials, wine whey, her head to be shaved and fomented; and a blister narrow, but lengthened along the spine; however, she grew worse and worse, comatose, and died on the 16th day.

In about ten days her husband, Mr Dennis was taken ill, and sent for me the 7th day of the fever, he had taken no advice, nor done anything, but as his wife had lived upon vinegar whey. He was not insensible, but stupid, complained much of his head, was rather costive, his pulse was very low; and his mouth and tongue daubed over with a yellowish viscid slime. Though he had no propensity to vomit, yet I thought it was in vain to give any medicine without cleansing the first passages, and ventured to order an ounce of the antimonial wine that night; I say ventured, because late in the disease, and his head so much affected. I was from prejudice, not reason, somewhat afraid. It puked once only, purged twice, and ended in a gentle and short continued sweat; so great was my fear for his head, that I had directed a blister and cataplasms to be in readiness, and applied if the force of puking made his head worse; but next morning I was agreeably surprised to find him better in all his complaints, and his pulse greatly mended. I directed the emetick to be repeated that evening, but being obliged to leave the town, the apothecary was afraid to give it, except I had been on the spot, from the scruples I had mentioned to him the night before. On the 9th day I saw him again, and found his head to be more affected, very stupid, and delirious, his pulse more sunk than ever, and a slight *subsultus tendinum*, and I imediately ordered a blister and proper cordials, his legs were blistered the day after. He had many fœtid stools and gradually recovered.

The next case that occurred was a soldier (Singleterry) of our regiment who was seized with the same fever, his pulse would not bear the lancet; and encouraged with the success of the emetic wine in the preceding case, on the third day of this man's disease I gave him an ounce and an half of it, which pumped up abundance of roapy bilious stuff, purged twice, and ended in a sweat, though of a short

duration ; but he mended gradually from the puke, his pulse which was very low before, now felt more full and firm, and though the fever remained for some days, yet in a very mild degree, nor did he take anything but the saline mixture with a little cordial confection.

Another soldier (Blews) took it on the 9th day of the fever with the same success ; a constant and violent headach troubled him all the time, but went quite off after the puke.

A sergeant (Wright) was seized with the fever, a very low quick pulse and great heat of the skin. On the 2d day of the disease I gave him an ounce and a-half of the wine, and he was perfectly well on the third day, only an old sore leg inflamed and swelled, which was carried off with Glauber's salts in an infusion of chamomile flowers.

Another soldier (Longsdale) who had been blooded, puked with ipecacuan. and his body opened with glysters, but on the 7th day his pulse turned very low, and he was ordered theriaca and wine whey, and on the 9th was blistered. When I saw him at Bandon on the 10th his pulse was quick and low, his mouth foul, was very sensible, but had great pain and uneasyness in his head, and had never slept from the attack. I ordered him an ounce of the emetic wine, after which he continually recovered without the assistance of any other medicine. (See his case page 243). [The letter at the close of this paper.—Ed.]

A deserter (Jackson) the other day in the Garrison Hospital, who had the fever, with seemingly dangerous symptoms, took the emetick wine with the same success.

One of the draughts (Woodhouse) was seized with the fever and a quick, hard pulse. He was blooded on coming in to the Garrison Hospital. On the third day of his disease, a violent pain in his head, stitch in his side, and the former blood which was rather sizy, determined me to bleed him again. On the fourth day his mouth and tongue were much furred over with a tough yellow mucus, and his pulse was very low. I gave him directly an ounce and a half emetic wine, and it operated very well, next day I found him better, and his pulse was greatly risen, but on the 6th day he was delirious at times, his pulse low, and his mouth again very foul, I was just going to repeat the vin-emet. but to try the difference of operation I gave him half a paper of James's powder, which operated entirely as the wine, only caused more sweat, the 7th day he was a little better, ordered him the saline mixture made with Sal. C. C. though rather acrescent, and some cordial contion added, and applied blisters, the 8th day persisted in the above medicines. The 9th day from the appearance of his mouth ordered half a paper more of James's powders, and after puking and purging he sweated very much. 10th day he was much easyer, more sensible and gradually has recovered, only a slight cough remains. He used the mixture, wine whey, and 5 or 6 times a day one spoonful of panada to make his drink readily mix with the animal juices.

Though I did not in these fevers lose a patient to whom the emetic wine was given, yet I do not infer that it is the only requisite ; I never trusted entirely to it's effects, except where the change for the better was sudden ; but I think from the above cases the following queries may be made with some reason.

1. In the state of the disease described can dilution be carried on ?

2. Are not the absorbent vessels plastered over with a colluvies tenax morbosa ?

3. And if the drink or medicines get into the blood, yet, by being strained through this putrid slime, does it not carry much fomes in with it ?

4. Doth not a very foul tongue and mouth indicate an emetick, and ought not a second and third appearance of that symptom, indicate the same to be repeated ?

5. Can we expect a person insensible to complain of a bad taste in his mouth, or can we expect that a lax inert stomach loaded with bilious tough slime to unlade itself unless by some extraordinary effect of nature or art ?

6. Is not an emetick of energy required, and is not that the best which will puke, purge and sweat ?

7. Is not from the above, the vinum emeticum a tollerable succedaneum for James's powders or probably equal thereto ?

8. Why is it the almost constant rule in giving but one puke in fevers, and that at the beginning only ?

9. Are not we (or rather was not I) too timerous in giving emeticks, when the head is affected, in those fevers that are not inflammatory ?

10. Are not the finest fluids obstructed, coagulated and rendered putrid in this disease, and besides evacuating the contents of the stomach and guts, is not the action of puking necessary to attenuate and resolve the obstructed lymph in the extreme capillaries, shall I say nerves ?

11. May there not be a great resolving quality attributed to the emetic wine besides the mere force it exerts in puking ; and is it not probable the more subtile parts of it get into the blood and pervade beyond it ?

I ought in support of the 5th query to mention Dr. Huxham's words, that he has many times with the greatest pleasure, in these fevers seen an amazing change for the better succeed a fit of vomiting and a stool or two, and he generally gave a laxative the 8th or 9th day except some eruption, or kindly sweat forbad its use. In those fevers among us I did not perceive any of the patients to have a tendency to puke, even from the first, and I do believe so dull and obtuse the nervous system is, especially towards the state, that were we to wait for that indication to give vomits, we might wait for ever. I cannot help remarking the foolish prejudice people have about shaving a man's face, washing the hands, and changing the bed-clothes and linen, and yet they have no objection to shaving the head, and putting on worn greasy linen that cannot be warmed. I always insisted on the person's being washed with Hungary water or brandy diluted with water ; and observed the patient much relieved by having his head and neck legs and arms, bathed and fomented with a decoction of chamomile flowers and rosemary and recommended frequent change of linen, except where sweating made it imprudent ; and I am certain these must have a good effect, especially fomenting the hands and feet, and sure I am it is comfortable to the attendants.

The following letter is from a person who has the care of two companies at Bandon.

Dec. 5th, 1757.

Sir,—I gave Longsdale the emetick about 12 o'clock. It began to operate about ¾ of an hour after. It vomited him very well and with ease : much green and yellow filth came off his stomach, during the operation he had a stool and a second after it was over. His pulse soon rose, and he sweated very much that night, next morning he was much better and continued to mend ever since.

The above person's case is mentioned before, I had not time to wait the operation of the emetic, so desired the person that attended him to send me an account of its effects.

There was nothing remarkable in the urine of the patient in the beginning, and about the 10th day none could be saved : and on the recovery, I did not observe that perfect sediment that might be expected.

Cork Dec. 6th, 1757."

Review.

CLINICAL MEMOIRS ON THE DISEASES OF WOMEN. By M. Gustave Bernutz, Physician to *La Pitié*, and M. Ernest Goupil, late Physician to the *Bureau Central*. Vol. II. Translated and Edited, [for the New Sydenham Society,] by Alfred Meadows, M.D., London, &c., 8vo, 1867.

In our number for the 2nd January in the present year we published a review of the first volume of this work ; and in doing so we noted the fact that the translation is not only an abridged, but a condensed version of the original, whose matter it represents, rather than its *ipsissima verba*. We also stated for the benefit of the reader, that the original work of MM. Bernutz and Goupil is not a dogmatic treatise on the Diseases

of Women, but merely, as its title indicates, a collection of Clinical Memoirs.

The present volume contains 270 pages, well put out of hands, as is usual with all the publications of the New Sydenham Society. The Editor's Preface is short, and explains the plan and contents of the volume so concisely that we shall allow Dr. Meadows to speak for himself. He proceeds thus:—

"This, the second volume of the work of MM. Bernutz and Goupil, is devoted to the consideration of two subjects, viz.:—*Pelvi-Peritonitis* and *Uterine Deviations*. The former of these has hitherto met with so little attention among English medical writers, that in many of our standard works no mention whatever is made of it. In many instances the disease is confounded with *pelvic cellulitis* or *peri-uterine phlegmon*, with which, indeed, it has little or nothing to do. Whether or no closer observation and study will show that the disease is more common than has been heretofore acknowledged, is a point which time alone can determine. Certain it is that the views here propounded have not as yet found much favour with physicians in this country. On the other hand, no one who reads the minutely detailed record of cases in the original of this volume, can doubt that the author (M. Bernutz) is a most careful and conscientious observer, and the results of the *post-mortem* examinations appear to be very conclusive as to the points at issue.

"In regard to the Second Part, which treats of Uterine Deviations, there is much there, also, which is opposed to the experiences of English Physicians. That flexions and versions of the uterus should of themselves give rise to no symptoms, and that the signs which we have regarded as indicative of uterine displacement should be ascribed entirely to complications which are independent of such displacement, these are doctrines which, startling though they be, are happily of such a practical character, and so far removed from the region of hypothesis and theory that their truth or error admits of very easy demonstration. All that is required, is full and fair investigation, and it is hoped that the publication of this work by the Council of the New Sydenham Society, will further the settlement of these disputed questions.

"I have added to the present volume a full Index and List of References to Authors, which, I trust, will be found useful."

As a specimen of the translation we beg to direct attention to the following extract, which constitutes the opening portion of chapter II. of the first part of the volume—that on Pelvi-Peritonitis. Respecting statistics of the origin of Pelvi-Peritonitis the writer says:—

"We have seen that cases of pelvi-peritonitis occur after delivery, either at full term, or prematurely; after menstrual disturbances; in the course of blenorrhagia; after venereal excess; and after certain traumatic measures, especially after the use of the sound. No doubt there are other circumstances also as precursors, as I shall show presently, but the former have been the more frequent during the six or seven years that I have investigated this subject. Most of the cases have occurred in the *Hopital Louis'ne*, and the majority were from 15 to 25 years of age; very few being as old as 30. It is necessary to insist upon these points, as it might appear strange that the affections in question are so seldom associated with organic lesions, and so frequently with blenorrhagia. I have taken no note of the cases observed by me when in charge of *La Pitié*, because some of the women's beds there are devoted to obstetrics; but an analysis of 99 non-obstetric cases observed in that hospital, in which the morbid conditions under which pelvi-peritonitis occurred was recorded, gave the following results:—

43 were puerperal	35 after delivery at term. 8 after abortion.
28 were blenorrhagic.	
20 were menstrual.	
8 were traumatic	3 after venereal excess. 2 after syphilitic disease of the cervix. 2 after the employment of the sound. 1 after the use of a vaginal douche, employed in a case of membranous ulceration of the cervix.

"This table shows very clearly how great is the majority of cases of puerperal pelvi-peritonitis, which alone numbers almost as many as all the rest put together, especially if we omit the last exceptional cases. I ought to mention that, in order not to multiply the divisions, I have included under the term *puerperal pelvi-peritonitis* not only those which occur after delivery at term, but those also following abortion; of which, however, I shall treat in a separate section."

The General Index and the List of References to authorities form a very fitting conclusion to these volumes, which Dr. Meadows has translated and edited with his usual fidelity and ability.

CURRENT LITERATURE.

AMONGST the publications, a notice of which has been delayed in consequence of the unusual pressure on our space, we may mention some that refer to the British Pharmacopœia. Of these, first of all is the new edition of the *Prescriber's Companion*, by Dr. Meadows, one of the neatest and most useful of the smaller works that have recently been published. We have gone carefully through this publication by Dr. Meadows, and have much pleasure in testifying to its completeness, elegance, and general utility. This edition has been corrected according to the New Pharmacopœia, and is what it professes to be—a most valuable prescriber's companion. Besides the preparations of the authorized national work, it contains a large number of others in daily use. These last are distinguished from the officinal ones by being printed in red ink. The book does credit alike to author and publisher (Renshaw).

An *Appendix* to the *Prescriber's Analysis* of the Pharmacopœia has also been issued, with a view of making that useful little work of service since the new edition of the British Pharmacopœia. We have examined this *Appendix* carefully, and find it very complete. Every possessor of Dr. Nevins's *Analysis* should at once purchase the *Appendix*, and bind it up with his volume. It is a necessary addition to that admirable little book.

Mr. Francis Vacher, under the title of *S du tion in Edinburgh*, has arranged a series of tables from the records of 364 first confinements in the Edinburgh Royal Maternity Charity. These tend to throw considerable doubt upon the popular notions respecting this subject, and the author seems to think that students and military men are commonly most unjustly maligned. Moreover, the statistics seem to show that it is not the rule for young women to be led astray by their superiors in social position, and on this point we think Mr. Vacher's investigations are more reliable than in the others. As the subject is exciting interest, we give the author's conclusions in his own words as follows:—

"I. That a very trifling per cent of the seduced have been led astray by men moving in a higher sphere than themselves; that as a rule, the seducers in each grade of the community are to be found within that grade; and that it is quite as much the exception for a gentleman to seduce the daughter of a working man, as it is for a private soldier to seduce the daughter of a minister, or for the child of a physician to be led astray by a policeman.

"II. That young women, whether servants or otherwise, are rarely, if ever, seduced by students attending the University.

"III. That soldiers are certainly not more guilty of the crime of seduction than other classes of the community."

It is very gratifying to learn that only one pupil of the University, and that a veterinary student, should have come upon this list, and that only one military officer should appear in the same category. There is, however, one circumstance which might invalidate the deductions drawn. That is, that no account seems to be taken of the fact that those who resort to hospitals belong to the poorer classes. We can scarcely believe that the unit represents the fair proportion of either of these classes who have thus committed themselves, and are disposed to think that some of them have provided for the unfortunate young women, without permitting them to resort to the Maternity charity. In that case the tables would rather represent those seductions in which the seducers had forsaken their victims. We offer the suggestion as one that may explain some of the tables, and recommend the pamphlet (published by Peddie & Muir) to all interested in such questions.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 3, 1867.

THE ELECTION AT THE LONDON COLLEGE OF SURGEONS.

THIS week will be decided the great contest which has so long occupied Professional attention. Three members of the Court of Examiners come before the Fellows as candidates for re-election into the Council, and they are to be opposed by men of the highest character, position, influence, and popularity, supported by that great body that is desirous of forcing reform upon this exclusive Corporation. There is no real personal objection to the retiring Councillors. SKEY, KIERNAN, and WORMALD have impressed their names upon the history of Surgery. Each has, perhaps, done his share of honest work. But these names belong to the past more than to the present. They are of that party to which the word Reform is a bugbear. The College has done well enough for them, they argue; and we may supplement their statement by saying they have done well enough for the College. But while they have been stationary, the Professional world has been moving; the Reformers in the College ranks have become a power. Inspired by a great principle, urged on by a still more earnest phalanx behind, they are determined to put their powers to the test, and are eager for the fray. They have every right to succeed.

If the Profession is to be rescued from the incubus of the Corporations which weigh upon it, it would seem that this is only to be accomplished by converting them into organizations worthy of support. If the College of Surgeons is to retain the distinguished position it has so long held, it must begin to deserve it, and this it will never do while selfishness reigns supreme in its government. Messrs. SKEY, WORMALD, and KIERNAN, have enjoyed the sweets of office for the last seventeen years or more, and what have they done, during all that long period, to entitle them to a further tenure of power? We are not aware of any reform they have ever proposed, or any that they have supported when others have brought them forward. We believe that, on the contrary, they have been staunch advocates of things as they are and have been. For ourselves, we are utterly sick of this condition of things, and could welcome any change—assured it could not be for the worse.

But what do their opponents promise? We confess that we should have been glad of a more definite announcement. It may be true enough that things have come to such a pass, that the mere cry of reform expresses almost everything. But platitudes of this kind are more easily uttered, and more quickly forgotten, than definite pledges. It would be something, indeed, to break in upon the Council with three new men? Such an infusion of fresh blood might prove a new starting point. But this accomplished—what then? Are we to stop there, or are we to have a definite policy announced? Unless men are to be found ready to carry out the wishes of the Profession, further changes must be made. Like the other Corporations, the College is too powerful. Its claws must be clipped. It must either be transformed into a representative institution, or sink to the level of the Barbers' Guild. A great opportunity is at hand. Shall it be lost through the insatiable selfishness of a clique?

Notes on Current Topics.

BIRMINGHAM LYING-IN HOSPITAL.—The Committee appointed some months ago to investigate the state of this hospital, have issued a report which concludes as follows:—"The recommendations which your Committee make may be summed up as follows—*a.* The in-patient department to be closed; *b.* The operations of the charity to be confined to midwifery cases; *c.* The out-patient department to be remodelled and widely extended; *d.* The employment of trained and certified midwives to be adopted as an experiment; *e.* The title of the charity to be changed to 'The Birmingham Lying-in Charity;' *f.* Ultimately it may be advisable to dispose of the hospital building in Broad-street, but it is recommended that it be retained until the result of the proposed changes be ascertained."

LONDON UNIVERSITY.—There is not likely to be any lack of candidates for this constituency. Mr. Bagshot, Mr. Wood, and Mr. Quain, Q.C., are already in the field, and the Committee of the last gentleman is actively at work. Our only objection to these candidates is, that they are not medical men. The Profession ought to be able to secure the return of a medical graduate, and we hope one will be found willing to come forward. In the late debate in the House of Commons, the position of the medical graduates was freely acknowledged. Why, then, should none be ready to seek the honour of representing it in Parliament?

NAVAL MEDICAL SERVICE.—An important change in the regulations for the admission of Assistant-Surgeons in the navy, has just been published. It requires all candidates in future to be registered as qualified to practice both Medicine and Surgery. This is a decided step in ad-

vance, and cannot fail to raise the status of the Naval Surgeon. Some special regulations are appended, and the candidate will still be subjected to a special examination. As a recompense for this ordeal, however, he will, through it, have the means offered of earlier promotion; for it is promised, that the best candidate of the year shall be promoted to the full surgeoncy, after five years' service; the second best man, after six; and the third man of his year, after seven years' service. Of course, this is provided that they pass their promotion examinations in a satisfactory manner, but this will not be a hard condition for the three best men of the year. We look upon these regulations with considerable satisfaction. For the first time, the double qualification is made the starting point, as it ought undoubtedly to be.

Scurvy in the Mercantile Marine.—A Bill for providing against the spread of scurvy in the Merchant Navy, and securing an adequate supply of genuine anti-scorbutic medicines, has appeared. By it a cubic space of seventy-two feet is apportioned to every seaman, in a well-ventilated and lighted portion of the ship, and the seamen's accommodation is to be inspected by the Board of Trade Surveyor when the ship is registered. The lime and lemon-juice is to be examined by competent persons, and stored in bond, to be issued as ship's stores under the ordinary regulations.

"Pall Mall Gazette" Testimonial.—We had the opportunity of inspecting during the past week the testimonial raised by the profession to the Pall-Mall Gazette, as a mark of appreciation of the spirited conduct of that Journal in reference to the Hunter trial. A description of the Testimonial will interest our readers, whether subscribers or not. It consists of a solid silver chased cup, with a figure on the top representing the Flight of Genius, on the front of the cup a chased medallion in oxodized silver, representing the crowning of wisdom and science in the presence of the virtues, together with a solid silver salver, on which is engraved—"Presented to George Smith, Esq., by members of the medical profession, and other friends, in recognition of the important service rendered to the community by the *Pall-Mall Gazette*, in successfully defending the action Hunter *v.* Sharpe, whereby the freedom of the press was once more vindicated, and the right of courageous and honest criticism affirmed, June 1867." The cup and salver, value 250 guineas, are designed and executed by Messrs. Ortner and Houle of 3, St. James's Street.

Poisoning no Murder.—The "glorious uncertainty of the law" has been beautifully displayed in the Court of Queen's Bench last week, in the case of Tully *v.* Corrie. Plaintiff was cook in defendant's family in July last year. While under notice to leave, her master gave her into custody in consequence of a suspicion that she had poisoned a particular gravy, after partaking of which every one in the house was taken ill. Evidence was tendered to shew that the cook did not take any of the gravy herself, nor give it to some of the other servants. Cook Tully having obtained her discharge, brought an action for false imprisonment against Mr. Corrie, and a *British jury* has awarded her £80 damages, but in the same verdict found that some noxious drug was really administered in the gravy! Surely a man *is* justified in giving into custody a cook who poisons the gravy. Why, then, should he be fined £80 for doing so? Such an inconsistent verdict cannot be allowed to stand.

Health of Edinburgh.—Some anxiety has been lately evinced at the high rate of mortality that has prevailed in the Scotch capital. Measles has been epidemic for months, and the *sequelæ* of this disease have proved unusually fatal. Scarlatina and whooping-cough have also been very prevalent. Now that summer weather has fairly set in, we may hope that chest complications will be less frequent, and when they occur, less serious.

Railway Accidents.—The case of Mr. Acton illustrates the difficulty of forming a prognosis in this kind of injury, and is, moreover, of considerable importance, from the decided hostility evinced by the Court to medical men becoming the agents for companies. Dr. Robertson is fully entitled to the credit of having avoided this practice, since he became aware of the opinion of the Judges, that it is not consistent with the position of a medical man. It is easy enough to understand how a Surgeon to a company may fall into the habit of making arrangements on behalf of his employers, but, inasmuch as he may be possessed of knowledge the patient cannot have, such bargains will always be looked upon by the public as one-sided, and will frequently be set aside by juries. Is it not, therefore, better for medical men to decline to interfere with matters that pertain rather to lawyers?

The Celsian Incision in Lithotomy.—Sir William Fergusson has lately reverted, in his practice at King's College Hospital, to the ancient proceeding adopted in the time of Celsus. Having introduced the staff, Sir W. Fergusson commences his operation with a lunated incision, the cornua, pointing downwards. He considers that this incision affords greater facilities for manipulation for the extraction of the calculus, and incurs less danger of wounding the rectum. He has lately operated upon two patients by this method with complete success.

Leeches.—These little animals, so useful in therapeutic agency, have been lately supplied to London and Paris from a new source. They have been sent in large numbers from Australia. When the fish are scarce with the Murray River Fishing Company, the men begin to pick up the leeches, which are so numerous that from 150,000 to 250,000, are sometimes collected in one trip of the company's steamers. From Melbourne they are exported chiefly to America, where leeches of the proper kind are everywhere scarce. Two or three millions, it is thought, will be collected and sold this season; and, no doubt, a remunerative trade will be carried on for years. It is stated that the Faculty, both in Paris and London, find them superior to any other obtained elsewhere.

Trousseau.—This veteran French Professor, whose death was prematurely announced a few months ago, has paid the debt of nature. He had long been suffering from a malignant disease of the stomach, and died on the 23rd ult. In him medicine loses one of her greatest expounders. As a teacher, Professor Trosseau was unrivalled. As a writer, as well as a practical physician, he stood for a long time great among the great ones of France. His funeral was conducted with the utmost

simplicity—it is said in deference to his own wishes on the subject. Nevertheless it was attended by an immense crowd of eminent men and students, who thus paid the last tribute of respect to the renowned physician. France has lately lost a considerable number of her eminent men. It is not long since we were called upon to say a few words about Jobert de Lamballe. Already there had been in type, but delayed, a notice of the death of Civiale, the lithotritist, and now the French School mourns the loss of Trousseau.

MALIGNANT PURPURIC FEVER.—A case is reported from London in the Registrar-General's return of last week—a publisher's clerk, aged 19; twenty-seven hours' duration. The Registrar-General observes "that down to the end of the seventeenth century, a heading under which many deaths appeared in the old London Bills of Mortality, was *Spotted Fever and Purples*, which means, probably, nothing more than fever in persons of a scorbutic habit." At the meeting of the Epidemiological Society of London, held on Monday, communications on this subject were read from Dr. Lyons and Dr. Mapother, of Dublin.

PAYMENT OF MEDICAL WITNESSES IN IRELAND.—The deputation from the Royal College of Surgeons in Ireland, to which we alluded last week as having proceeded to London, with the view of representing to the Government the advisability of introducing into the Common-Law Bill now passing through Parliament, a clause providing for the payment of medical witnesses at the same rate as in England, waited on the Attorney-General for Ireland, who received them, and heard with attention their representations to that effect. The Bill was read a second time on Thursday week, and was set down for Committee on last Monday evening. We hope to be able to inform our readers in another portion of our issue if any further progress be effected in this important matter.

ELECTION OF THE PADDINGTON MEDICAL OFFICER.—A meeting of the Paddington Vestry was held on the 18th ult. for the purpose of electing a medical officer of health for the district. Six gentlemen had been selected by the Committee for recommendation to the Vestry—namely, Mr. Bird, Drs. Hardwicke, Stevenson, Divers, Mushet, and Potter, from whom the Vestry would select one as Medical Officer of Health :—

As no one proposed either Dr. Potter, or Dr. Mushet, their names were withdrawn from the list.

Mr. Hall proposed, and Mr. Brettingham seconded, the nomination of Dr. Divers. Mr. A. G. Bicker Caarten proposed, and Mr. Gutch seconded, the nomination of Mr. Bird.

The Rev. Dr. Burns said he had great pleasure in proposing Dr. Hardwicke, who, in his opinion, was the best man for the office. The testimonials sent in by Dr. Hardwicke were unique, and incontrovertably proved that his qualifications were of the very highest character, and showed that he was specially adapted for the special work a Medical Officer of Health had to perform; and in his (Dr. Burns) opinion, if they were to search through the whole of the metropolis, they would not find a fitter officer than the gentleman he had the honour to propose. He had been acquainted with Dr. Harkwicke for many years, knew that he was a member of, and occupied a high position in several scientific societies, that he was a practical chemist of high repute; the author of several works from which his opinions were quoted, and he was held to be an authority in all matters relating to sanatory or medico-legal science. He was a gentleman of great experience and enlarged views; he possessed tact, activity, and the method of applying the remedy to the evil at once; he was courteous and urbane, and his reputation was European in all matters appertaining to the technicalities, the legal and the chemical programme of sanatory and medical science.

Mr. Dickinson said he had great pleasure in seconding the nomination, in his opinion Dr. Hardwicke was pre-eminently qualified for the appointment he sought.

The Vestry then proceeded to elect, and with the following results:—For Mr. Bird, 4. For Dr. Stevenson, 18. For Dr. Hardwicke, 29.

Dr. Hardwicke was then called in, and on being informed of his success, he expressed his thanks in an appropriate manner.

The vestry then adjourned.

Foreign Medical Literature.

INVESTIGATIONS RESPECTING ARTERIAL DILATATION AS A RESULT OF NERVOUS IRRITATION.

By Dr. CHRISTIAN LOVEN.

TRANSLATED FROM THE "HYGIEA" FOR NOVEMBER, 1866, P. 425.

By WILLIAM D. MOORE, M.D., Dub. et Cantab., M.R.I.A.;

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS; OF THE NORWEGIAN MEDICAL SOCIETY; AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; EXAMINER IN MATERIA MEDICA AND MEDICAL JURISPRUDENCE IN THE QUEEN'S UNIVERSITY IN IRELAND.

(Continued from Vol. iii., page 611.)

3. THE diminution in the pulsation of the heart observed in irritation of a sensory nerve, is brought about pre-eminently by reflex irritation of the nervus vagus, the number of the pulsations falling, after the division of this nerve, either not at all, or only inconsiderably. It may even, as von Bezold has shown, under such circumstances, rise considerably. Whence this opposite change of the impulse of the heart proceeds, must for the present be left undecided.

From the facts hitherto communicated, it now, however, follows that the dilatation of the blood-vessel which occurs on irritation of a sensory nerve, cannot be caused by the increased pressure of the blood, but that, on the contrary, the contraction of the arteries is the most active cause of the latter. If, we must further conclude, the arteries of a vascular circuit be dilated, the tone of their nerves must previously be depressed. This must incontestibly hold good for all the cases in which a dilatation occurs, without an increase of the pressure of the blood above its normal value being at the same time observed. If a diminution in the tone of individual vascular circuits be united with an augmented pressure of the blood, a very considerable dilatation of all the vessels in the circuit to which the relaxed arteries belong must evidently take place. To this circumstance, as I will even now remark, it apparently ought to be ascribed, that the irritation of sensory nerves very often produces in their circle of distribution a much more intense redness than would arise in consequence of division of corresponding filaments of the sympathetic.

2.—*On arterial dilatation from irritation of the posterior and anterior auricular nerves.*

As our literature does not afford an accurate description of the nerves which ramify in the external ear of the rabbit, I may be permitted first to interpolate some anatomical facts.

The external ear in the rabbit receives branches from the first cervical ganglion of the sympathetic, from two spinal nerves (the anterior and posterior auricular), and from four cerebral nerves, namely—the facial, the trigeminus, the vagus, and the glossopharyngeal.

The *sympathetic nerves*, as is well-known, take their origin from the inner margin of the first cervical ganglion, and run in close connection with the arteries ramifying in the ear.

The *anterior auricular nerve*, from the cervical plexus, but principally from the anterior branches of the second and third cervical nerves, arises at the posterior margin of the sterno-cleido mastoid muscle, and runs, covered only by skin and cutaneous muscles, forwards and upwards

towards the external ear. It receives some branches from the superficial cervical nerve, sends some small branches to the skin over the parotidean region, and finally divides into two branches, of which one turns forward to ramify on the anterior side of the posterior thin edge of the ear, while the other runs in the middle of the posterior surface, where it spreads out as far as the tip.

The *posterior auricular nerve* arises from the posterior branch of the second cervical nerve, passes, after having given off some muscular branches among the deep muscles of the neck, outwards and forwards, covered by a couple of thin muscular layers, to the upper side of the root of the external ear, and through a cartilaginous process thereof, to and along its anterior, obtuse margin.

The *facial nerve* gives to the muscles of the external ear, a great number of branches, partly before the trunk of the nerve has emerged from the canal of Fallopius, but partly first, in front of the meatus auditorius cartilagineus.

The *auriculo-temporal branch* of the Trigeminus, arises at the posterior margin of the branch of the infra-maxillary ascending from the fossa, and divides immediately into three principal branches, of which one passes outwards and downwards to anastomose with the facial, one ramifies in the temporal region, and the third is resolved into two or three long fine filaments, which may be traced as far as the indentation found in the inferior margin of the orifice of the ear.

Arnold's nerve (ramus auricularis vagi), is in the rabbit, comparatively speaking, not inconsiderable. It arises high up in the foramen lacerum by two roots, of which one proceeds from a ganglion of the vagus, the other from the glosso-pharyngeal nerve ; it then passes through a proper bony canal in the supero-posterior wall of the cavity of the tympanum to the Fallopian canal, where it partly connects itself with, partly continues its route obliquely over, the facial nerve, to emerge through the bone upon the upper surface of the cartilaginous tube of the ear ; here it applies itself through a certain length to the cartilage, but finally perforates the latter, and is resolved, on the concave side of the muscular structure of the ear, into its terminal branches.

In order to be able conveniently to observe the changes occurring in the diameter of the auricular vessels, and to avoid all disturbances of the circulation, which might be caused by alterations in the ear, a fixed position was given to the head and ear, capable of being maintained undisturbed during the whole experiment. For this purpose a vice was used, ordinarily employed in such cases in the Leipsic Laboratory. It ought to be unnecessary more fully to describe this simple instrument—for distinctness, it is sufficient to say, that the head is held up by a cradle which catches round the cheeks, and that a forceps seizes the apex of the outer ear, and keeps it extended without exercising any pressure on its root or intervening portion. After the head and ear have been fixed in this manner, the two auricular nerves are in succession sought for, doubly tied, and finally divided between the ligatures. The peripheral and central ends of the divided nerves can now be isolated and conveniently irritated, by means of an ordinary galvanic battery. I must most decidedly warn the operator, in such experiments, always to try the properties of both nerves, as I have found, that in the following the phenomena described were not produced with equal distinctness by each, but that at one time one, at another the other, was in this respect especially active.

By Snellen's experiments it was first established, as is well-known, that a painful irritation of the central stumps of the nerves mentioned produces first a contraction, and afterwards a dilatation of the arteries of the ear. This series of phenomena we meet with also undoubtedly in most cases, when we experiment on a sound and lively animal. The route by which both the contraction and the dilatation are brought about, passes through the auricular nerve to the medulla oblongata, and thence through the cervical trunk of the sympathetic to the vessels of the ear. The proof of this lies, as is well-known, in the fact that after division of the sympathetic cervical trunk, the already red ear does not become perceptibly more highly coloured through irritation of the sensory nerve stump.

Before proceeding to the results I obtained in repeating Snellen's experiment, I ought also to remark that I can likewise confirm M. Schiff's statement, that the spinal auricular nerves contain filaments, which stand in direct connection with the circular muscles of the arteries. Division of one or other of the nerves mentioned produced in general a persistent dilatation of a part of the artery in the ear of the side operated on. This dilatation extended usually merely over the part of the artery running in the neighbourhood of the apex, and was capable of being changed to its opposite by irritation of the peripheral stump, and particularly also in cases where the cervical trunk of the sympathetic had previously been divided. In this latter modification of the experiment the artery continued to be dilated for the greater part of its course through the ear, while, on the contrary, it was contracted in the tip and lateral parts of the organ. Usually the contracted part was quite sharply defined from the dilated.

I now return to the results obtained by irritation of the central nerve-stump. When a strong, unpoisoned animal was employed for the experiment, it was observed in most cases that after the commencement of the irritation the auricular artery was contracted. This occurred the more certainly and rapidly, the more vehemently the animal by cries and movements manifested its pain. The contraction of the artery continued for a time, certainly different in different cases, but always very short, and afterwards gave place—and this while the irritation still continued—to dilatation. The latter always commenced in the trunk of the auricular artery, and proceeded thence rapidly to smaller and smaller branches. It was not until this had taken place that the veins filled, and the ear acquired a deep red colour.

The chief interest connected with the above experiment seems to me to lie in the decision of the question, how far the dilatation occurs merely in consequence of the previous contraction—in other words, whether the dilatation is a result of the exhaustion produced in the sympathetic by the previous effort. If this were so, we should expect that a certain proportion should exist, with respect to duration and intensity, between contraction and dilatation. But this, as we easily discover from a larger number of experiments, is by no means the case. Sometimes the subsequent dilatation is the more considerable, the more marked the preceding contraction was, but in many other cases a scarcely perceptible contraction is followed by a very considerable dilatation. Once it happened even in an unpoisoned animal, that immediately after the commencement of the irritation a very considerable dilatation occurred without the slightest trace of preceding contraction —a phenomenon which, in the animal in question was repeated as often as the irritability of the sensory nerve still permitted the renewal of the experiment.

Just as these circumstances are incompatible with the assumption that the vascular dilatation is caused by exhaustion of the sympathetic after previous effort, seems to me to be the case with respect to another fact. Thus, if we irritate the exposed cervical trunk of the sympathetic nerve, so as to give rise to a contraction of the arteries, as persistent or still more persistent than that which an irritation of the sensory nerve stump is capable of producing, we sometimes certainly observe, after the close of the irritation, a slight dilatation of the vessels of the ear ; but never did I see this nearly so considerable as after irritation of the auricular nerve. Hence it clearly follows that it is by no means so easy to exhaust the sympathetic nerves.

In order that the experiment might acquire greater purity and that the special circulation of the blood might be independent of the violent movements of the limbs and thorax, I gave up the observation of the unpoisoned animal, and, turned to the use of curare. Hereupon I was favoured

in the very commencement of my investigations with such a measure of success, that I lighted upon a great number of animals, in which irritation of sensory nerves in various parts of the body always forthwith produced a dilatation of the vessels which was often much more considerable than that following on division of the corresponding sympathetic trunks. For this, but still more for another reason, the observations alluded to testified against the theory which would make the dilatation a result of exhaustion. In fact, there now commonly followed upon the dilatation, and this either while the irritation continued, or immediately after its close—a contraction, which in some cases was more considerable than it had been before the irritation. As a further illustration of the case, the following series of observations, with the addition of the determinations of the times, may be given:—

Number of the Experiment.	Nerve.	Intensity and duration of the irritation.	Occurrence of the dilatation after the commencement of the irritation.	Occurrence of the contraction after the commencement of the irritation.
1	Nerv. auric. ant.	Moderately strg. 15 scds.	5 seconds	35 seconds
2	,, ,, ,,	,, ,, 22 ,,	6 ,,	40 ,,
3	,, ,, ,,	,, ,, 17 ,,	6 ,,	28 ,,
4	,, ,, ,,	,, ,, 12 ,,	5 ,,	22 ,,
5	,, ,, ,,	very strg. 5 ,,	5 ,,	15 ,,
6	,, ,, post	weak 17 ,,	4 ,,	16 ,,
7	,, ,, ,,	stronger 15 ,,	5 ,,	30 ,,

The dilatation which occurred after irritation of the sensory auricular nerves on one side, was in some instances completely limited to the ear of the side operated on, but in many other cases it extended also to the ear on the side not operated on. Here, however, the redness was much slighter, began from two to four seconds later, and, except in a single instance, passed earlier into paleness, that is, contraction of the vessels, on the side operated on.

If I had not extended my experiments to a much greater number of rabbits, I should, from this successful commencement, have been tempted to consider it as a peculiarity in animals under the influence of curare, that in them irritation of the sensory nerve-stumps at once produces dilatation of the vessels. Continued investigations showed me, however, the opposite, as I subsequently several times met with animals, who were affected as is usually the case in unpoisoned animals. However, curare always promotes the occurrence of the primary redness.

3.—*Dilatation of the arteria saphena by irritation of the nervus dorsalis pedis.*

Starting from the known fact, that painful impressions on the human skin commonly produce redness therein, I believed it, *a priori*, probable that the phenomenon observed in the ear would be met with also in other parts of the rabbit's body. In the choice of the place to be tried, care should be taken that no nerve trunks should be tetanised, in which, with the sensory fibres, run sympathetic fibres of the arteries on which we wish to observe the dilatation. As the sympathetic branches usually attach themselves to arterial trunks of the higher order, the saphena artery is in the rabbit particularly well adapted for such an experiment, as it receives its sympathetic branch from the lumbar plexus, and separately from the nervus saphenus. The dependence of the arterial muscles on the nerve mentioned is easily seen, for if we divide the nervus saphenus, the artery of the same name is suddenly dilated, while, if we irritate the peripheral stump of the nerve, the vessel contracts. The arteria saphena ramifies down to the foot, so that the nervus dorsalis pedis is one of the nerves belonging to its circuit of distribution.

But, not merely from this circumstance, but also from its origin and course, is this artery especially suitable for observation. It arises from the crural artery, before the latter perforates the adductors, and runs as a very fine red cord along the inner side of the leg. Although in an animal under the influence of curare it is ordinarily much contracted, it is, nevertheless, always easily found, because it is accompanied on both sides by veins—an anterior larger, and a posterior smaller vein. I cannot avoid remarking that I met with two cases in which the artery, instead of running down to the ankle, terminated in that one of its branches which passes, on the inside of the knee-joint, into the rete patellare. In dissecting the artery we must, of course, take care not to injure the nervus saphenus, which accompanies the vessel.

I accidentally commenced my experiments with irritation of the central extremity of the nervus dorsalis pedis in the very same animal in which irritation of the auricular nerves immediately produced a dilatation. The saphena artery now behaved precisely as the auricular had done. Just as before happened in the ear, a quite extraordinary dilatation suddenly took place, in from four to six seconds after the application of the irritation, in the previously only just visible vessel, which rapidly increased to its maximum, and again completely disappeared in some seconds after the removal of the galvanism. The artery not merely became dilated, but also began to pulsate strongly, which was particularly well seen on holding the leg somewhat bent at the knee-joint, inasmuch as the vessel was then strongly raised and rolled by every wave of blood thrown into it; the phenomenon could for a very long time be repeated in the same animal. In several experiments subsequently instituted in the same manner, I obtained, almost without exception, the same result; and I may, moreover, add that irritation of the tibial nerve, below the inner malleolus, also leads to the same. In a couple of cases certainly dilatation occurred, but it was of only very short duration, and disappeared even while the irritation was going on. The same was observed also in those cases where the phenomenon at first appeared fully developed, but where either the irritant employed was very strong, or the experiment was too long continued. These irregularities are, therefore, in all probability, ascribable—as in the latter cases to exhaustion—in the former to an accidental weakness in the irritability of the nerve.

The question quite naturally here presents itself: how far this dilatation extends? Is it limited to the artery in question, or do perhaps a greater number of arterial vessels take part in it? To enable me to answer this question, I observed in three experiments during irritation of the nervus dorsalis pedis, both the femoral artery freely dissected through its whole course, from the groin to its passage through the adductors, and also some muscular branches given off from the same. As to the latter, Ludwig and Thiry have mentioned that muscular arteries in general very quickly lose their irritability; in this case also no distinct results could be obtained as to the point in question. It is indeed, moreover, possible, that these vessels were placed, by the necessary preparation, in a state of lessened irritability, or, perhaps, even of paralysis, so that we cannot expect from them any information as to the effect of peripheral irritation. Though I, therefore, do not venture altogether to assert positively that the muscular arteries, under the circumstances referred to, do not at all dilate, thus much is at least certain, that the dilatation which may have occurred did not cease on the removal of the irritant, but that the vessel remained in the same state, so long as the experiment continued. About the same may be said of the main trunk of the femoral artery. This seemed, indeed, in the beginning of the experiment to dilate somewhat, but did not afterwards further alter its diameter. We could then, also, quite evidently see that the changes above described belong properly only to the cutaneous branch mentioned, as they always commenced precisely in the place where the cutaneous artery arises from the crural artery, and, what seems still more remarkable, while the pulsations in the branch were so strong, they appeared quite inconsiderable in the large artery, and were not all increased on irritation.

The apparently paradoxical fact, that so small a branch

of the crural artery pulsated while the pulsation of the main trunk itself was scarcely perceptible, is easily explained by the unequal resistance of the vascular walls, and precisely this inequality in pulsation shows that the relaxation was limited to the wall of the arteria saphena.

In the course of my observations having met with curarised rabbits, in which irritation of the auricular nerves produced a primary contraction, I found that irritation of the nervus dorsalis pedis in the same rabbits also produced a primary contraction, and that in the animals in which irritation of the auricular nerve produced at one time dilatation, at another contraction of the vessels of the ear, irritation of the nervus dorsalis pedis behaved in the same manner with respect to the arteria saphena. However, this coincidence is not without exception, for I have observed an animal whose auricular artery was primarily dilated, while the saphena became alternately wider and narrower.

I have also instituted a series of experiments upon other parts of the body than those already mentioned. On the whole, these were, however, not numerous. Nowhere were such well-marked phenomena obtained immediately on the first experiment as the ear and skin of the leg exhibited. Thus, in two experiments, the sensory facial nerves (the infra-orbital, supra-orbital, and mental) were irritated, the freely dissected external maxillary artery being at the same time observed. In the commencement of the experiment we succeeded in producing, by irritation of the infra-orbital, a dilatation passing off with the irritation, and increased pulsation of the vessel, but the phenomenon could be produced only a couple of times in the same animal. The arteries of the fore-arm behaved in a similar manner on irritation of its cutaneous nerves ; on the other hand, no dilatation of the external mammary artery could be obtained by irritation of the nerve running with the artery to the lacteal glands.

Sometimes curarised dogs were subjected to the same experiments, but these animals proved unsuitable for the object in view. If the sensory nerve was irritated, dilatation of the arteries certainly seemed to occur, but the previously contracted condition did not return, even if the irritation was discontinued for several minutes. From the small number of experiments I performed, I cannot with certainty state whether this is a general or only an individual character in the dog.

(To be Continued.)

Proceedings of Societies.

HARVEIAN SOCIETY'S COMMITTEE FOR THE PREVENTION OF VENEREAL DISEASES.

APPOINTED 21ST FEBRUARY, 1867.

REPORT OF THE COMMITTEE.

Owing to various reasons, the attention of the public has of late years been drawn to the enormous evils which result to society from the extent of the spread of the so-called venereal diseases among all classes. So severely have the ravages of these complaints affected the British army, that, in the year 1864, the army statistics showed that, of an average number of 73,000 troops stationed in the kingdom, there was a "loss of service by venereal diseases, in the whole force, of nearly an entire week of that body's time." Again, in the year 1862, of 88,600 men of the Royal Navy admitted into hospital, 7000 were so admitted for venereal diseases. To remedy these evils the Parliament of Great Britain passed first an Act, entitled the "Contagious Diseases Prevention Act," which came into operation in December 1864 ; and subsequently a Royal Commission was appointed, which examined a number of medical men and other witnesses, and was styled the "Venereal Diseases Commission." The result of the labours of this Commission was the passing of an Act of Parliament, entitled the "Contagious Diseases Act of 1866." The object of this Act being merely the prevention of venereal diseases in the Army and Navy, its operation holds good only for the towns of Portsmouth, Plymouth, Woolwich, Chatham, Sheerness, Aldershot, Windsor, Colchester, Shorncliffe, the Curragh, Cork, and Queenstown, all of which are military or naval stations.

The general features of the "Contagious Diseases Act, 1866," are, that the police of the above-mentioned towns have the power of causing any common prostitute, carrying on open prostitution in these places, to be taken to a dispensary to be examined as to their state of health, and, if diseased, of enforcing their stay in Government hospitals until cured. Added to this the very satisfactory results respecting the diminution of venereal disease in many of the French and foreign towns, tended much to encourage somewhat similar attempts in this country. At this juncture it was that the promoters of the "Congrès Medical International de Paris, 1867," proposed the following question to its various members :—*Question* 3. "Est il possible de proposer aux divers gouvernements quelques mesures efficaces pour restreindre la propagation des maladies vénériennes ?"—*i.e.*, Is it possible to propose to different governments some efficacious measures against venereal contagion ? Incited by the foregoing causes, the members of the Harveian Medical Society of London came to the resolution, on Feb. 21st, 1867, on a motion proposed by Dr. Drysdale and seconded by Dr. T. Fox, that a Committee should be formed for the following purpose—"To investigate the extent of the spread of the contagious diseases, commonly called venereal diseases, among the population of this country ; to discuss the best means for preventing that widely extended evil, and to report thereon to the international congress to be held this year in Paris." The Committee consisted of members of the society especially interested in this question ; and they have invited the co-operation of several distinguished members of the profession, who have devoted their attention to the subject. The following gentlemen have taken part in the deliberations of the Committee—"Dr. Pollock, the President, Mr. Acton, Dr. Bazire, Dr. Beigel, Dr. Broadbent, Dr. Chapman, Mr. W. Cooke, Mr. H. Coote, Mr. W. Coulson, Mr. Curgenven, Dr. C. Drysdale, hon.-sec., Mr. R. W. Dunn, Dr. T. Fox, Mr. Gascoyen, Mr. E. Hart, Mr. B. Hill, Dr. Hjaltelin, Mr. J. Lane, Dr. Maudsley, Dr. Menzies, Dr. Meredyth, Mr. de Meric, Dr. Semple, Mr. Sedgwick, Dr. Steele, Dr. Stuart, Mr. Teevan, Mr. H. Thompson, and Dr. Vintras.

The Committee at their first meeting, in March 13th, determined to send out circulars to all the large hospitals in Great Britain and Ireland, requesting to be informed as to the daily number of venereal cases seen at each hospital ; the proportion of these cases to the surgical cases seen ; and the number of beds set apart for such cases in each hospital. This was accordingly performed, and the Committee have to express their warmest thanks to the various surgeons and other gentlemen of these hospitals, for the important information furnished by them. From these reports it will be seen that the damage inflicted on the general population by contagious venereal diseases is enormous, and it would not, perhaps, be too much to say, that no disease of a preventible character causes greater evils among society at present in this country than these do. Thus the report from Mr. Coote, surgeon to St. Bartholomew's Hospital, shows an average daily number of 174 venereal cases seen, or about half of the surgical out-patient cases. The report from Guy's Hospital, by Dr. Steele, shows that about 43 per cent. of all the out-patients seen annually are venereal. Of the surgical out-patients far more than half are venereal according to Mr. Cooper Foster. The Royal Free Hospital, London, sees daily 117 cases of venereal disease, or three-eighths of its surgical cases are venereal. At the hospitals of King's College, University College, St. Mary's Hospital, Westminster, the London Hospital, the Middlesex Hospitals, and the Metropolitan Free Hospital, the number of venereal cases seen varies from one-third to one-fifth of the out-patient surgical cases daily seen at these hospitals.

The London Lock Hospital sees daily 179 male and 39 female out-patients. It has never more than 30 beds available for the prostitutes of London, the majority of its beds being kept for government cases under the Contagious Diseases Act, 1866. At the *Dreadnought* Seamen's Hospital, London, about 50 cases of venereal disease are seen daily among the sailors of the mercantile marine, who are much infected by venereal diseases. In the Ophthalmic Hospital of Moorfields, one-fifth of the cases of eye disease among the out-patients are reported by Mr. Hutchinson as being caused by syphilis.

There are very few beds for venereal patients in London. Thus, the Lock Hospital, as before said, has not more than 30

beds available for poor women or prostitutes afflicted with even the gravest affections, and according to Mr. James Lane, and Mr. Gascoyen, is constantly compelled to send away applicants, even with large ulcerations of the genitalia, for want of room. Guy's Hospital has 56 beds for venereal patients, 25 for men, and 30 for women. St. Thomas's Hospital, which used to have venereal beds, is not in good working order at present. The Royal Free Hospital has 26 beds for female cases; and women are daily sent away, suffering from the most contagious conditions of disease. The Middlesex Hospital has only 11 beds for female venereal cases. Venereal cases are not admitted into St. George's Hospital as a rule, or into St. Mary's, University College, or many other of the London hospitals. There are only about 4 beds for female venereal cases at the London Hospital, which has no less than 450 beds, and very few at others, with the exception of St. Bartholomew's Hospital, which has 25 beds for men and 56 beds for women. There are thus, in the whole of London, with a population exceeding 3,000,000, probably not much more than 150 beds in hospitals available for prostitutes, or poor women with contagious venereal diseases. Now, in 1865, there were in London, according to the Police Reports, entitled "Judicial Statistics," close upon 6000 prostitutes well-known to the police, and classed by them with thieves, and other bad characters. This, however, probably does not include more than one-third of those who gain their living by prostitution, and, as a very great proportion of them are diseased, it can well be imagined how inadequate the supply of beds is for this population, all of whom are spreading far and wide the evils of contagious venereal disease.

One important fact has been elicited from the enquiries made by the Committee of the Harveian Medical Society, and that is, that the Workhouses of London do not, except to a very limited extent, take in prostitutes, when suffering from these diseases, but send them off to beg for the shelter of the very inadequate number of beds provided for them in the Lock and other charitable institutions. Thus, the Strand Workhouse, the Whitechapel Workhouse, the City of London Workhouse, the Paddington Workhouse, St. Olave's Workhouse, Lambeth Workhouse, Shoreditch Workhouse, St. Martin's Workhouse, Hackney Workhouse, Bethnal-green Workhouse, St. Luke's Workhouse, St. Giles' Workhouse, and Newington Workhouse, do not seem, collectively, to devote above three dozen beds to the reception of female venereal cases, and send off such applicants to the Lock Hospital (to which they subscribe certain sums annually), to the Royal Free, or St. Bartholomew's, or Guy's Hospital, to struggle for admission with a host of unfortunate applicants, many of whom being rejected, are forced to go on with their trade in order to live.

The effect of syphilitic disease upon the health of children was shown by the report from Dr. Williams, from the London Hospital for Sick Children, Ormond-street. This report shows that, in 1866, there were 93 boys and 105 girls affected with syphilis, out of 1007 surgical cases seen, or about one-fifth. In hospitals and dispensaries for the treatment of skin diseases, from one-eighth up to four-fifths of the cases are reported by Dr. Hunt and others to be secondary syphilitic cases. There still exists a strong feeling in the mind of the public that venereal diseases, being brought on for the most part by promiscuous intercourse between the sexes, ought not to have the same attention shown to them as any other class of diseases. This feeling has produced the result that, at many dispensaries and hospitals in London and the provincial towns, no venereal cases are admitted. Thus, St. George's, St. Mary's, University College Hospital, London, and others, do not profess to treat such cases. Mr. Jackson reports from South Staffordshire Hospital that there are no beds for such cases. The Portland-town Free Dispensary says it is one of the rules that no venereal patient is to be admitted to the benefits of the charity. Islington Dispensary, likewise, has scarcely any venereal patients. Other dispensaries, again, as the Farringdon Dispensary, London, according to Mr. Dunn, report that as much as one-eighth of the surgical cases are venereal. The report from the Nottingham General Hospital says that "Primary sores and gonorrhœa are seldom seen; a certain class of practitioners and the quacks get hold of them all." In the Hull General Infirmary there are no beds for such cases, as also in the Dumfries General Hospital. The consequence of these regulations of the Committees of the various hospitals, of course is, that a vast number of cases of venereal disease in all of our large towns remain untreated, and thus contagion is propagated on all sides; and, besides this, patients are thus encouraged to seek the aid of unskilled and uneducated persons, to the great detriment both of their health and their pockets. In London, according to Mr. Coote, the worst cases of disease came from the Whitechapel District, East, where there is really nothing worth calling accommodation for the large number of diseased prostitutes of that poor and densely-peopled district. It is to be hoped that this may soon be remedied.

With regard to the accommodation for venereal disease in other towns in Great Britain and Ireland, it seems to be as inadequate in all the large towns except Dublin, which has a Parliamentary grant, as it is in London. Very few towns have lock hospitals at all; and those which have such have far too few beds for all patients requiring admission. Liverpool, Southern, and other hospitals send their venereal cases to the Lock Hospital, which has fifty beds, and an average of forty-five inmates of these beds, male and female. The Dublin Lock Hospital only admits female cases, and has, on an average, 86 such cases, and no out-patients. Staffordshire General Infirmary has four male and four female lock beds, frequently empty. Chester Infirmary has, on an average, two female lock patients. In the Royal Infirmary of Edinburgh, according to Dr. Gillespie's report, there are 26 venereal beds, the Edinburgh Lock Hospital is only for females. The Royal Infirmary of Glasgow has no beds for venereal cases; and the Glasgow Lock Hospital has only 45 beds for these cases. Belfast General Hospital has six venereal inmates, and a small ward set apart for females.

The importance of the late Government examinations in reducing the amount of venereal disease in the localities which are placed under the operation of the Act is shown by the fact vouched for by Dr. Stuart, of Woolwich, Government Inspecting Officer under the Act, that, although the Act came into operation only in October, 1866, the amount of disease in April, 1867, was only one half of what it had been in Woolwich, and consisted, in a large proportion of cases, entirely in gonorrhœa. The examinations, too, at Woolwich had as yet been confined entirely to women *suspected* of being diseased. In October, 1866, the proportion of cases of venereal disease found among the troops quartered at Woolwich was 1·75 per cent., and by April, 1867, the proportion of cases belonging to the troops in the garrison was not much over a half per cent. of their number, or less than a third of what it was. Again, it appears that at Sheerness there have only been 36 admissions for venereal disease into the Garrison Hospital from January 1st to April 22nd, 1867, whilst Aldershot, which in April, 1867, had not yet been put under the operation of the Act, was reported by Mr. Powell in April, 1867, as being in a deplorable condition with respect to venereal disease. There were two venereal female wards in the workhouses with 18 beds adjoining the camp (which contains 10,000 men), and a fever ward had also to be used for the poor diseased women, with an average of only 200 cubic feet for each patient. The consequences of this was the excessive severity of the cases, and an extensive infection of the troops. By this time it is believed that sufficient accommodation has been obtained for the poor diseased women; and that this terrible state of things is much mitigated. In the Herbert Military Hospital, Woolwich, there is a daily average of 84 venereal cases. All venereal cases in the army are treated as in-patients; and, according to Mr. Teevan, this regulation is a bad one, often causing soldiers to have recourse to chemists and other surgeons, instead of going to their own army medical man, because they object to low diet, and detention in-doors.

Dr. Nankwell reports that there are forty female venereal beds at Chatham for prostitutes, under the Contagious Diseases Act, 1866. The disease is much milder and less frequent in consequence of the operation of that Act. The result of the various reports which the Committee have received, have led them to hope that a very great deal might be done towards the prevention of venereal diseases, which are now so serious an evil in this country, and especially in large towns. Paris, a very much less populous city, has upwards of 450 beds for female venereal cases, and 336 for males, whilst London has not much more than 150 female beds at present for women affected with these diseases, and certainly not much over 100 beds for male venereal cases—a provision so inadequate as completely to account for the excessive frequency of these diseases, as seen in the practice of hospital medical officers, and also of private practitioners. Mr. Acton has calculated that there ought to be 1500 beds for males and females in London, devoted to such cases in order to be in proportion to those so devoted in some of the

Continental towns, and the Committee are of opinion that even this is not an exaggerated estimate. The Committee earnestly hope that the hour has at length arrived when the attention of the profession and the public may be aroused to the enormity of the existing evils; and the necessity of doing something towards preventing so preventible a class of diseases as those commonly called venereal disease. Small-pox has, in many communities, been effectually stamped out by means of Government legislative measures; and there is no reason why the same attempt should not be made in this country, to prevent the spread of one of the most grievous plagues, to which the human race is a prey.

The facts above stated are the results of the investigations of the Committee, extending over a period of four months. They have been elicited by enquiries addressed to the medical officers of a large number of the hospitals, dispensaries, and workhouses throughout the kingdom. After repeated discussions upon the above-mentioned facts, and having ascertained the enormous amount of preventible disease existing, and the entire inadequacy of the existing means for treating, as well as for checking its extension, the Committee have adopted the following resolutions, by a great majority of its members :—

"That there is a great deficiency of hospital accommodation in London, and other large towns of this country, for patients, especially females, affected with venereal diseases."

And furthermore (considering that the sanitary regulations in various foreign countries have been of the most signal service in checking the amount, and mitigating the severity of these diseases; and, also, that great advantage has already been derived, in a very brief period, by the operation of somewhat analogous methods in this country, in the military and naval stations, from the operation of the Contagious Diseases Act of 1866), the Committee are of opinion :—

"That regulations similar to those contained in that Act might be carried out by the police, without difficulty, among the civil population, in London and other large towns, the essential features of the system being as follows :—

"That a register of all women known to be acting as prostitutes, should be kept by the police. That such women should be required to submit themselves to a periodical examination by a medical officer appointed for that purpose, and that, when found to be suffering from venereal disease, they should be detained in hospital until cured—additional accommodation being provided for that purpose.

"It is desirable that the registration of women above suggested should be kept for the private use of the police authorities only, and should be in no way accessible to the public; also, that no certificate of health should be given to the women on the occasion of their periodical examinations, and that when discharged from hospital, the certificate of cure should not be given to the women themselves, but be forwarded to the police authorities.

"The object of the Committee in suggesting legislative interference is solely the prevention and cure of venereal disease, and they believe that this desirable end would be, to a great extent, obtained by regulations, such as those above suggested, which would be sanitary in their operation, and which would involve no public recognition of prostitution, and no registration of prostitutes, or of houses used for the purpose of prostitution, that would be available to the public.

"The carrying out of the above system would require the maintenance of a number of beds for persons affected with venereal disease at the public expense, and the Committee, therefore (considering the vast amount of preventible venereal disease exisiting in London, and other large towns, and also the fact that poor women, when suffering from such diseases, are not admitted into the workhouse infirmaries, but are, in the majority of cases, sent to the Lock Hospital, which is quite inadequate for their reception), are of opinion that provision should be made for the reception of such persons, either in special hospitals, or in special wards set apart for such cases in workhouse hospitals; and they would suggest whether it would not be possible that provision should be made for this purpose, in the new Poor-law arrangements of Mr. Hardy's Bill."

In conclusion, the Committee cannot help expressing their earnest hope, that the time has at length arrived, when the society of this country shall become alive to the distressing amount of human suffering caused by the prevalence of contagious venereal diseases, and the extreme and pressing necessity of endeavouring efficiently to prevent the frequency, and mitigate the severity of these pests.

ST. ANDREWS GRADUATES' ASSOCIATION.

Dr. RICHARDSON, President, in the Chair.

A MEETING of the Council took place on Friday afternoon at the Freemason's Tavern. Present—Drs. Richardson, Crisp, T. Dyer, Rogers, Ray, Sheppard, Dudfield, Ballard, Day Goss, Prosser James, Leonard Sedgwick, Day, W. Williams, Tanner, Abbotts Smith, Seaton, Leonard, and others.

The minutes of the general meeting (we have already reported) were read and confirmed.

Several encouraging letters from officers and others were read to the Council. A letter from Mr. Slater Booth, Secretary to the Poor-law Board, in reference to honorary degrees. It would appear from the letters that a number of graduates have already taken the hint that has been offered, and have brought their influence to bear upon individual members of Parliament.

Moved by Dr. DUDFIELD, seconded by Dr. THISTLETON DYER :—

"That a deputation be formed to wait upon Sir Graham Montgomery, who has charge of the Scotch Reform Bill."

It was agreed that the deputation should consist of the Council, with other members of the Association, and members of Parliament favourable to the movement.

On the motion of Dr. DAY, of Stafford, seconded by Dr. EDWARDS CRISP, it was agreed that the Secretary should address a memorial to the Senatus Academicus of the University of St. Andrews, informing that body of the object of the Association, and especially urging upon it to assist the graduates in obtaining a voice in the representation of the University.

Dr. ROGERS proposed, and Dr. WILLIAMS seconded :—

"That the President and Secretary be a sub-committee to collect and print the facts respecting the number of rejections in the examinations, &c., and to circulate them amongst members of the Association and others."

It was thought that the individuals could use them to advantage in communications with their representatives in the House of Commons.

OBITUARY.

SIR STEPHEN LOVE HAMMICK, BART.

THIS gentleman died on the 15th of last month, at the advanced age of 90 years and upwards, being born February 28th, 1777. He began his medical career at the Royal Naval Hospital, Plymouth, when he was very young, where he became Assistant Surgeon and Lecturer, and performed many important operations before qualifying as a surgeon; indeed, at that time a diploma was not considered so much a *sine qua non* for a man in his position who had enjoyed so many opportunities of instruction, and witnessed so many operations, in which he had largely assisted, as, with our advanced science and more perfect system, it is reckoned now-a-days. At 22 years of age, however, he entered at St. George's Hospital, London, as pupil, and, very shortly after, applied for admission to the Corporation of Surgeons, by examination. In October, 1799, he became a member of that body, returned to Plymouth, and was immediately appointed full surgeon to the Naval Hospital. He remained in connexion with it for 30 years, when he requested and obtained permission to retire from public service. He then came to London and took up his residence in Cavendish-square. Through the influence of the friends he had made at Plymouth, he was appointed Surgeon to the King, and obtained a good general practice among naval officers and the higher classes of society. He was elected to the Senate of the London University, when that institution was founded, and was Examiner in Surgery there for some years. The baronetcy was conferred upon him in 1834, probably in acknowledgment of his services in the Naval Hospital, where he himself performed numerous operations, and was present at those performed by others in the military hospitals, the prison depôts, and hospital ships in that port. He was not a voluminous writer; his chief publication was the course of lectures delivered to the students

in the hospital at Plymouth, which contain the result of his varied experience, and display an intimate knowledge of the surgical practice of his time. The College of Surgeons, England, is indebted to him for a valuable collection of preparations, in which are numerous specimens of injuries and diseases of the bones. He devoted himself with great diligence to the duties of his profession, and gained for himself a name and a large circle of friends among the noblity, with whom he was on terms of close intimacy to the time of his death.

MEDICAL TRIAL.

COURT OF QUEEN'S BENCH, WESTMINSTER, JUNE 26TH.

(Sittings at Nisi Prius, before the Lord Chief Justice Cockburn and a Special Jury.)

BONNEY *v.* SMITH.

MR. Coleridge, Q.C., and Mr. H. Matthews were counsel for the plaintiff; Mr. Serjeant Robinson and Mr. Inderwick were counsel for the defendant.

This was an action of slander. The plaintiff is a physician practising at Horsleydown, and the defendant is a surgeon practising at St. Mary's Cray. In May, 1866, the plaintiff gave evidence at a trial before Mr. Baron Channell in the Court of Exchequer, in which Mr. Rudman sued Mr. Armstrong, a surgeon, for negligence and want of skill in the treatment of Rudman's daughter. The plaintiff gave evidence against Mr. Armstrong, but the jury found a verdict in his favour. At a meeting of the Tunbridge-wells branch of the Medical Association, Mr. Smith, the defendant in this action, spoke of the unprofessional conduct of Dr. Bonney in giving evidence against a brother practitioner, and stated charges which he intended to make against Dr. Bonney before the council of the Association. The speech was reported in the *Journal* of the Association, and this action was the result. Dr. Bonney was not a member of the Branch Association, and could not, therefore, attend to rebut the charges, but he sent a reply to the speech in the form of a letter, which was inserted in the same paper.

The defence was that the defendant had no ill-feeling towards the plaintiff, but, as the secretary of the Association had read a report in which Rudman's case and Dr. Bonney's evidence were referred to, he was anxious that the members should know exactly what were the charges which he intended to bring before the council. Upon this ground it was submitted that the statement was privileged.

The LORD CHIEF JUSTICE held that it was not privileged, but said he would reserve leave for the defendant to move.

The jury interposed to ask whether they should have to determine the question whether the defendant was justified in making the statement, and being answered in the affirmative, said they were all agreed on that point.

The CHIEF JUSTICE said they must hear counsel unless they waived their right to address them.

A conference then took place and a juror was withdrawn.

The LORD CHIEF JUSTICE said he thought that was the best course to pursue, because although the plaintiff might have been entitled to a verdict as to the part which was not justified, it was doubtful after the intimation of the jury whether they would have given sufficient damages to carry costs.

THE "PALL MALL GAZETTE" TESTIMONIAL.

ON Wednesday last a large and influential meeting of the profession was held at the house of Mr. Hills, in Queen Anne-street, on the occasion of the presentation of a testimonial to Mr. George Smith, the proprietor of the *Pall Mall Gazette*. Sir Thos. Watson, Bart., presided, and many of the leading practitioners of the metropolis were present. The chairman briefly stated the objects of the meeting.

Dr. BURROWS, in presenting the testimonial to Mr. Smith, stated that he did so as the representative of the subscribers, both present and absent. It was a testimonial on the part of the members of the medical profession to the proprietor of the *Pall Mall Gazette*, for his able, fearless, disinterested, and benevolent efforts in a great public cause. Dr. Burrows proceeded to show that it was of the utmost consequence that the public should be able to discriminate between the truly scientific practitioner of medicine, and he who rested his claims to support on self-laudation and advertising, and on the presumed possession of superior knowledge in the treatment of disease. The *Pall Mall Gazette* had, at considerable expense, and with great boldness, stood up in defence of the legitimate practitioner, and had thus earned the respect and gratitude of the medical profession.

In returning thanks, Mr. SMITH spoke of the high gratification he experienced in receiving so splendid a testimonal from so large a number of the members of a liberal and learned profession. He proceeded to say that in the first instance, Dr. Hunter was quite unknown to him and the editor of the *Pall Mall Gazette*. He had never seen him until the day of the trial. He had taken up the matter entirely on public grounds. Originally the question was discussed without reference to the medical profession, but solely in the interests of the public and as an act of duty. But when the action was commenced against the *Gazette* the members of the profession came forward to his support, and acted most generously and effectively in the cause of truth and justice. Mr. Smith concluded an able address by expressing his thanks to the secretary, treasurer, and subscribers to the testimonial, and especially to the chairman of the day and to Dr. Burrows.

Votes of thanks were afterwards proposed and carried unanimously to those who had taken a prominent part in promoting the testimonal, and more especially to Mr. Hills, in whose house the proposal of the testimonial originated and in whose house it was presented.

Parliamentary Intelligence.

HOUSE OF COMMONS.—JUNE 21ST.

EXEMPTION FROM RATING.

IN reply to questions by Mr. J. A. SMITH and Mr. BAINES,

Mr. G. HARDY said, in the present state of public business it would be impossible to introduce a measure to exempt hospitals, infirmaries, and certain schools from the payment of poor rates. The matter, however, should receive his most earnest consideration.

THE IMPORTATION OF CATTLE.

Mr. AYRTON called attention to the order of the Privy Council of the 28th of May, 1867, respecting the importation of cattle, with the view of eliciting information on the subject from the Vice-President of the Committee of Council.

Mr. CRAWFORD thought this a matter which required the anxious consideration of the Government.

Lord R. MONTAGUE justified the order, the object of which was to give facilities for ascertaining whether animals were infected or not.

Major JERVIS regarded the order as one of the most absurd ever issued.

Mr. AYRTON withdrew the amendment.

JUNE 24TH.

The Vaccination Bill as amended was considered and ordered for third reading.

JUNE 25TH.

BROWN'S CHARITY BILL.

The Duke of MARLBOROUGH, in moving the second reading of this Bill, explained that its object was to alter in some respects the nature of a bequest made by Mr. Thomas Brown some years ago to the London University, for the purpose of founding a sanitary animal institution.

The Earl of Rosse, the Bishop of Down, Lord Cairns, Lord Talbot of Malahide, and the Earl of Powis opposed the measure.

Earl GRANVILLE supported the Bill, and said that the London University had already accepted the trust, and that the only object was to make the bequest as useful as possible.

On a division the Bill was thrown out by a majority of 48 to 16.

Correspondence.

THE ABUSE OF MEDICAL RELIEF TICKETS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—If any thing could show the necessity of an amended Medical Charities Act, particularly with regard to the shameful abuse of giving tickets for relief to persons in

good circumstances, I shall give you two instances of this—one Dispensary day's occurrences :—

1. The liveried coachman of a titled personage presented a ticket for medical relief *signed by his employer* (who is a member of the Committee of Management as a ratepayer). As the man was really very ill he was, of course, an object for professional consideration, and was accordingly attended to.

2. Was a wonderfully dressed *young lady*, silk coat and dress to match, and bonnet with a perfect parterre of flowers adorning it, and veil to cover her blushes, presented another ticket from a *guardian of the poor* for dispensary relief also. It appeared that this *poor patient* was a late arrival from the land of stars and stripes; and, although she had acquired the genteel accent of Boston, she had not added to the accomplishment by imitating the independent spirit of her adopted country.

You may imagine, from this narrative of one day's proceedings, to what a grievous extent this shameful abuse has attained, and what little hope there can be of amendment by leaving these matters to the discretion of interested individuals.—I am, dear sir, yours most truly,

A Dispensary Medical Officer.

THE ICE-BAG.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Seeing your remarks upon the use of the "ice-bag" in sea-sickness, it occurs to me to enquire whether the same application is likely to be equally efficacious in the sickness attending a bilious attack? If so, it would be, indeed, a boon to thousands of sufferers.—I am, sir, yours obediently,

Pro Bono Publico.

Medical News.

Royal College of Physicians, of London.—The following officers were elected on June, 25, 1867:—

Censors—Henry Bence Jones, M.D.; Thomas Bevill Peacock, M.D.; William Wegg, M.D.; Richard Quain, M.D. *Treasurer*—William Emmanuel Page, M.D. *Registrar*—Henry Alfred Pitman, M.D. *Librarian*—William Munk, M.D. *Member of Council*—William Munk, M.D. *Examiners*—Anatomy and Physiology, John William Ogle, M.D., and Samuel Wilks, M.D.; Chemistry, Materia Medica, and Practical Pharmacy, Andrew Whyte Barclay, M.D., and William Marcet, M.D.; Principles and Practice of Medicine, Frederic John Farre, M.D., and Edmund Lloyd Birkett, M.D.; Midwifery and the Diseases peculiar to Women, Charles Blakely Brown, M.D., and Henry Oldham, M.D.; Principles and Practice of Surgery, George David Pollock, Esq., F.R.C.S. and John Birkett, F.R.C.S. *Curators of the Museum*—William Emmanuel Page M.D.; George Hamilton Roe, M.D.; William Wegg, M.D.; and Francis Sibson, M.D.

Queen's University in Ireland.—At a Meeting of the Queen's University, held in Dublin Castle, on Thursday, June 20, the following degrees were conferred:—

The Degree of Doctor in Medicine upon Mark Edward Anthony, Q.C., Cork; John Barry, Q.C., Cork; William Fuller Bennett, Q.C., Cork; John Walton Browne, B.A., Q.C., Belfast; Robert de la Cour Corbett, Q.C., Cork; Edmund Maurice D. FitzGerald, Q.C., Cork; James Frazer, Q.C., Belfast; Matthew Moriarty Gallwey, Q.C., Cork; Michael Upington Greany, Q.C., Cork; Thomas Kingston, Q.C., Cork: Frederick Lyons, Q.C., Cork; William Henry Macnamara, Q.C., Cork; Patrick Richard Martin, Q.C., Cork; Thomas Henry Sandiford, B.A., Q.C., Cork; Rosslewin Morgan, Q.C., Cork.

And the Degree of Master in Surgery upon

William Fuller Bennett, Q.C., Cork; Robert de la Cour Corbett, Q.C., Cork; Edmund Maurice D. Fitzgerald, Q.C., Cork; James Frazer, Q.C., Belfast; Matthew Moriarty Gallwey, Q.C., Cork; William Beech Johnston, M.D., Q.C., Cork; James Leatham, M.D., Q.C., Belfast; Frederick Lyons, Q.C., Cork, Thomas Henry Sandiford, Q.C., Cork.

Trinity College, Dublin—School of Physic.—Examination for the Degree of M.B.—Maximinum number of Marks, 100:—

Yeo, 86; Helm, Dubley, 79; Dobson, 77; Cotter, 75; Henry, 73 Owen, 72; Curran, 61½; Watson, Maunsell, 66; Pollock, 65½; Jago Popham, 62½; Goode, M'Dowell, Blenkinsop, 61½; Reynolds, 61; Paxton, 58½; and Duke, 58.

Examination for the Degree of Ch.M.

Yeo, 76: Jago, 58; Cotter, 56; Popham, 53; Pollock, 48; and Reynolds, 34.

List of Entries in the Register of the Branch Medical Council (Ireland) for the month of June, 1867:—

Wm. McConaghy, Rhymney, Tredegar, Monmouthshire, L.R.C.S.I., 1867.

Mathew Fletcher Ryan, 17, Vicenage-park, Belfast, L.R.C.S.Edin., 1867.

John Gubbins Rahilly, Charleville, Co. Cork, L.R.C.S.I., 1864; L. Apoth. H., Dubl., 1865.

James Meehan, Limerick, L.R.C.P.Edin., 1866; L.R.C.S.Edin., 1866.

Malachy Joseph Kilgarriff, 47, Harrington-street, Dublin, L.R.C.S.I., 1865; L., 1866; and L. Midwif., 1866; K.Q.C.P.I.

Joseph Patrick McDermott, Riversdale, Dundrum, Co. Dublin, L.R.C.S.I., 1867; L., 1867; and L. Midwif., 1867; K.Q.C.P.I.

John Shaw, 3z, Blackhall-street, Dublin, L. Apoth. H., Dubl., 1828.

Solomon Kellett, Virginia, Co. Cavan, L.R.C.S.I, 1866; L., 1867; and L. Midwif., 1867; K.Q.C.P I.

Geo. Wm. Owens, 25, Kildare-street, Dublin, L.R.C.S.I., 1866; L.K.Q.C.P.I., 1867.

Medical Officers of the Guards.—The charge of the Guardsmen in the House of Commons last year on behalf of their Medical officers, although not immediately successful, has been followed by a siege operation which has carried the War Office. The ground of complaint, it will be remembered, was a proposal to change the immemorial system of regimental promotion in the Guards on the strength of a "submission paper," which was signed in 1860, but not produced till 1866, and which was to have retrospective action. General Peel stoutly maintained that the business of the Medical officers was to obey orders and submit to their lawful governors. And he protested against the "House of Commons governing the army." In the end, however, the Duke of Cambridge and Sir John Pakington have now conceded what obvious justice demanded, and what might have been granted at first with a much better grace. Officers affected by the retrospective action of the warrant will be promoted within the regiment specially in their turns, and will thus be in great measure (but not wholly) indemnified. Not wholly, for the new *régime* will bring junior men in the regiment into senior positions over their heads, and prevent their reaching the higher grades within the time assigned by the service regulations. Thus one or more of the present Assistant-Surgeons can never become Surgeons-Major in their regiments, who otherwise would have done so.—*Pall Mall Gazette.*

A numerously-attended and influential meeting of friends and pupils of the late Professor Goodsir was held in the Hall of the Royal College of Surgeons of Edinburgh—the President, Dr. Dunsmure, in the chair—when the following resolutions were adopted:—1. That this meeting, deploring the loss which science has sustained by the loss of Professor Goodsir, resolves that steps be taken to form a lasting memorial of his distinguished career as an original investigator and teacher of anatomy and physiology. 2. That the most appropriate manner of commemorating Professor Goodsir's services as an investigator and teacher is the establishment in the University of Edinburgh of a Fellowship in Anatomy and Physiology, to be called the "Goodsir Fellowship." A committee was appointed, with power to add to their number, to collect subscriptions for the above purposes, to frame regulations for the Fellowship, and to report to a future meeting of subscribers. The Edinburgh Executive Committee includes the following names:—Principal Sir David Brewster, chairman; Sir George Harvey, President, Royal Scottish Academy; Sir James Y. Simpson, Bart.; Dr. Burt, Vice-President, Royal College of Physicians; Professor Balfour, Professor Christison, Dr. John Chiene, Dr. Dunsmure, President, Royal College of Surgeons; Dr. Matthews Duncan, Dr. Handyside, Professor Maclagan, John Muir, LL.D.; Dr. Lyon Playfair, C.B.; Dr. Smith, President, Royal College of Physicians; Professor Syme, Dr. Sanders, David Smith, Esq.; Professor Turner, Dr. Andrew Wood. Honorary secretary—Dr. Craig Maclagan, 5, Coates-crescent; honorary treasurer—Dr. Joseph Bell, 5, Castle-terrace. Professor Gairdner, Professor Lister, Professor Young, Glasgow; Dr. J. Adamson, St. Andrew's; Dr. Aitken, Inverness; Dr. Borthwick, Dumfries; Dr. Greig, Dundee; Dr. Johnson, Stirling; Dr. Mills, Thurso; Dr. Stirling, Perth.

The succession of the late Dr. Jobert de Lamballe has just been settled. The portion falling to each of his five heirs is £22,400, or £112,000 in all. "A handsome fortune," says *Calignani*, "when the fact is remembered that the illustrious surgeon came to Paris a poor lad."

Lithotrity.—The *France Médicale* of the 22nd inst. (June), contains a letter from an old and well-known lithotritist, M. Guillon (the same who brought an action against the Academy of Medicine of Paris for not awarding him the prize for improvements in the treatment of urinary diseases), in which he strives to prove that "a large stone can be broken up and reduced to sand by *immediate* crushing, without requiring perforation." M. Guillon obtains this result by his lever lithotrite, which he places high above the lithoclast and three-valve lithotrite of Civiale.

A TRAP TO CATCH SUNBEAMS.—In the optical room of the Conservatoire des Arts et Metiers at Paris, near a window, is an unpretending frame, containing half-a-dozen test tubes filled with powders, bearing a written descriptive label by M. Becquerel. Should any one pause before this object he need not be surprised if an attendant politely steps forward and closes the window-shutter, for darkness is required to reveal the beauties of the apparatus. The powders then exhibit in a most striking manner the phenomenon of phosphorescence, each shining winh a different coloured light. A similar series of powders has been arranged for sale in a neat little box, and has been brought under our notice by Messrs. Harvey and Reynolds, of Leeds. It is called by its French makers the "Phosphoroscope," though this name has been applied to a very different instrument; but as a scientific toy it is likely to become known in England as "A Trap to catch Sunbeams." Most of the powders are sulphides, and the brightest emanation is, probably, from the tube containing sulphide of barium. The phosphorescence may be induced by exposure to daylight for a few seconds, or to the light of a piece of magnesium wire.—*Laboratory.*

THE CATTLE PLAGUE IN GERMANY.—M. Bouley, member of the Academy of Medicine of Paris, was recently sent to Germany, by the Minister of Commerce, to report upon the alleged new outbreak. M. Bouley, who was accompanied by M. Imlin, an eminent veterinary surgeon of Strasburg, found that the information had been much exaggerated. In the Duchy of Baden, Frankfort, Hesse Hanau, and Hesse Cassel there was not a trace of the plague. In the Saxon Duchies and at Meiningen the Prussian Government were extremely severe: fourteen battalions of troops had been sent to the invaded districts, and a sanitary committee appointed to prevent the spread of the disease. Military occupation and cordons were quickly established, and, in one locality alone, more than 100 head of cattle were sacrificed. Precautionary measures were carried so far in Bavaria, that all travellers entering the country were placed in apparatuses to undergo chlorine fumigations. M. Bouley considers that the German authorities act with so much vigour that France has no cause to feel apprehension; he has, therefore, advised the Minister of Commerce to suspend the restrictions lately imposed on the entrance of cattle from Germany into the French empire.

NOTICES TO CORRESPONDENTS.

Communications to the London Editor should be addressed to 20, King William-street, Strand; to the Edinburgh Editor, at Maclachlan. and Stewart's, South Bridge; and to the Dublin Editor, at 3, Lincoln-place.

All Contributions are attentively considered, and unaccepted MSS. are returned on receipt of stamps for postage; but the Editors cannot be responsible for any accidental loss, nor can MSS. or replies be delivered on personal application.

Contributions should be *legibly* written, and only on one side of the paper.

When proofs are forwarded it is of the utmost importance that they should be corrected and returned without delay.

MEDICAL APPOINTMENTS.

ATKINSON, J. P., M.D., has been appointed Medical Officer and Public Vaccinator for the Bampton No. 2 District of the Whitney Union, Oxfordshire, vice G. B. Prickett, M.R.C S.E., deceased.

BADER, Dr. C., has been reappointed Curator at the Royal London Opthalmic Hospital.

BENNETT, H., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Ambergwessin District of the Builth Union, Brecknockshire, vice T. Blumenthal, M.D., resigned.

BRAMLEY, L., F.R.C.S.E., has been appointed a Vice-President of the newly formed Halifax Medical Association.

COATHUPE, E. W., M.R.C.S., has been appointed Surgeon to the Tredegar Iron Works, Monmouth, vice C. A. Homfray, M.R.C.S., resigned.

DAVIES, O., L.R.C.P.Ed., has been appointed Medical Officer for the Kingston District of the Portsea Island Union, vice J. F. Pritchard, M.R.C.S.E., resigned.

DOBLES, Mr. W. S., has been appointed Dispenser to the Hereford General Infirmary, vice Mr. G. Bullock, resigned.

DOLAN, T. M., L.R.C.P.Ed., has been appointed Secretary of the Halifax Medical Association.

GARLICK, J. W., M.D., has been appointed President of the Halifax Medical Association

JONES, J., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Builth District of the Builth Union, vice Thomas Jones, M.R.C.S.E., resigned.

LYNCH, A. H. F., L.R.C.S.I., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Innfield Dispensary District of the Trim Union, vice D. M. Ferguson, M.D., resigned.

MUIR, Dr., has been appointed Medical Officer for the Wombwell District of the Barnsley Union, Yorkshire, for one year.

NEWTON, J. L., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Isleham or No. 9 District of the Newmarket Union, vice T. F Fernandez, M.D., who resigned upon receiving a similar appointment in the Ross Union.

RICKARDS, W., M.D., has been appointed a Junior Assistant-Physician to the City of London Hospital for Diseases of the Chest, Victoria-park.

RIDDELL, J., L.R.C.P.D.Ed., has been appointed Medical Officer to the Workhouse and Fever Hospital of the Cootehill Union, Co. Cavan, vice P. H. Horan, L.R.C.P.Ed., resigned.

ROE, G. H., M.D., has been appointed one of the Consulting Physicians to the Hospital for Consumption and Diseases of the Chest, Brompton, on resigning as Physician.

SMITH, S., M.R.C.S.E, has been appointed a Vice-President of the Halifax Medical Association.

TAIT, R. L., L.R.C.P.Ed., has been appointed House-Surgeon to the Clayton Hospital and Wakefield General Dispensary, vice W. J. Sykes, M.B., resigned.

VACHER, F., L.R.C.P.Ed., L.R.C.S.Ed., has been appointed Assistant House-Surgeon to the Birkenhead Borough Hospital.

WHATELY, G. F., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Berkhampstead District and the Workhouse of the Berkhampstead Union, vice T. Whately, M.R.C.S.E., deceased.

WILLING, G. B. F., L.R.C.P.Ed., has been appointed Honorary Assistant-Surgeon to the 7th Essex Rifle Volunteers, vice J. W. Oswald, L.R.C.P.Ed., resigned.

MEDICAL VACANCIES.

Lock Hospital—Surgeon.
Metropolitan Free Hospital—Assistant-Physician.
St. Mary's Hospital, Paddington—Assistant-Physician.
St. Olave's Union, Southwark—Medical Officer.

POOR-LAW MEDICAL VACANCIES.

Shepton Mallet Union.—Fourth district; area 9595; population 2701; salary, £65 per annum.
Torrington Union.—Shebbear District; area 10,834; population 1893; salary, £25, 13s.

Births, Marriages, and Deaths.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

CURTIS.—On the 21st ult., at Staines, the wife of A. Curtis, M.R.C.S.E., of a son.

EVANS.—On the 20th ult., at Dyffryn-Ceri, Newcastle Emlyn, the wife of Thos. Evans, M.R.C.S. and L.S.A., of a son and heir.

GWYNN.—On the 20th ult., at 5, Belgrave-terrace, Upper Holloway, the wife E. Gwynn, M.D., of a daughter.

HUGHES.—On the 22nd ult., at Downs-road, Clapton, the wife of H. W. Hughes, M.R.C.S.E., of a daughter.

LEACHMAN.—On the 21st ult., at Petersfield, Hants, the wife of A. W. Leachman, M.D., of a daughter.

WHITE.—On the 21st ult., at Mestyn-road, Brixton, the wife of Dr. S. White, of a daughter.

BLACK.—On the 25th ult., at Cocksburnspath, the wife of James Black, surgeon, of a son.

WHITE.—On the 14th ult., at Great Wellington-street, Paisely-road, Glasgow, the wife of J. White, M.D., of a son.

HINDE.—On the 14th ult., at Rathgar, the wife of Dr. B. Hinde, Staff-Surgeon Army, of a son.

GAMBIER.—On the 17th ult., at Grove-street, Regent's-park, the wife of Thos. Gambier, M.R.C.S.E., of a son.

HOLT.—On the 22nd ult., at Petersfield, Hants, the wife of Wm. Holt, M.R.C.S.E., L.S.A., of a daughter.

MARRIAGES.

BOURNES—BURGESS.—On the 5th ult., at the parish church of Monkstown, County Dublin, William H. Bournes, M.D., M.R.C.S., of Ballycastle, County Mayo, to Lizzie Anna, eldest daughter of Thomas Burgess, Esq., Royal-terrace, Kingstown, County Dublin.

GRIBBON—ALLAN.—On May 23, at St. Andrew's Church, Montreal, Canada, G. C. Gribbon, M.B., Assistant-Surgeon 1st Battalion 25th Regiment, to Lizzie, eldest daughter of H. Allan, Esq., Ravenscraig, Montreal.

HOOPER—DALKEN.—On May 4, at the Cathedral, Quebec, A. Hooper, Surgeon, H.M. 30th Regiment, to Julia Harrison, second daughter of H. S. Dalkin, Esq., of Quebec.

MEAD—PALMER.—On the 20th ult., at St. Mary's, Warwick, W. T. Harvey Mead, M.R.C.S.E., &c., of South Hackney, Middlesex, to Selina Lousia, third daughter of J. Palmer, Esq., The Square, Warwick. No cards.

MUNRO—BELLAS.—On the 18th ult., at Bongate, J. Munro, M.D., of Barnard Castle, to Mary, daughter of the Rev. T. Bellas, M.A., Vicar of the Parish of St. Michael, Appleby. No cards.

DEATHS.

PHIPPS.—On the 20th ult., at 2, Belle Veu-place, Cheltenham, J. G. Phipps, M.D., aged 49.

WARD.—On the 20th ult., at East-hill-house, Epsom, Joseph Ward, M.R.C.S.E., aged 67.

JAMIESON.—On the 17th ult., at Clifton-terrace, Edinburgh, James Jamieson, M.D., aged 78.

LYON.—On the 19th ult., at Wentworth-place, John Briant Lyon, L.S.A., aged 56. Much regretted.

NCE.—On the 21st ult., John Ince, M.D., of Chester-square, London.

Original Communications.

SURGICAL COMMENTARIES:

INTENDED AS A DIGEST OF THE AUTHOR'S PRINCIPLES AND PRACTICE, AS ILLUSTRATED BY THE MORE IMPORTANT SUBJECTS OF SURGERY.

By GEORGE MACILWAIN, F.R.C.S., Etc.

AUTHOR OF "MEDICINE AND SURGERY, ONE INDUCTIVE SCIENCE;" "THE UNITY OF THE BODY;" "DISEASES OF THE MUCOUS CANALS OF THE BODY;" "STRANGULATED HERNIA;" "LIFE OF ABERNETHY," AND OTHER WORKS.

NO. I.—PREFATORY OBSERVATIONS.

I AM desirous that these papers should be preceded by some understanding with those who may honour them with a perusal, as to what I have chiefly in view, and the somewhat limited means at my disposal for the accomplishment of it. I shall thus avoid leading them to expect more than I presume to offer, or to charge me with a greater responsibility than I am willing to incur.

There is reason to believe that the present state of medical science is not satisfactory, either to the public or the profession ; and that this feeling is shared at least by many of the most studious, the most thinking, and most discerning of both classes of the community.

If this be so, there must, one would think, be some good in the unreserved communication of our observations and our experience, and conclusions which may have been deduced therefrom. In doing this, we should claim for ourselves, and concede to others, the privilege of saying what is really thought on all subjects to which they have given attention ; and not only so, but we should put forth our conclusions in a way which shall not be uncourteous, or inconsiderate of the opinions or feelings of others.

As it appears to me, the causes of the present state of medical science are not difficult to explain. The chain, to be sure, is composed of a variety of links, the relation of which to science, of any kind, were they isolated, would be difficult to discover. This, however, is, for our present purpose, unimportant. The main fact is, that they all culminate in one great cause, which is—"That medical science is not cultivated in a sufficiently strict manner."*

There is no branch of knowledge that I am aware of, which has made any material progress, without regard to the ordinary rules of induction or collecting the facts, and the careful application of ordinary rules of logic in deducing its conclusions. I am sorry to observe that medical researches are too commonly conducted without any very strict attention to either.

We have only to read almost any periodical, to discover some contribution, on which conclusions are drawn from premises, which do not justify such conclusions, but in which there is so general a neglect of anything approaching logical accuracy, as to be, so far as I have observed, unparalleled in any other science whatever.

Investigations have seldom included all the facts having relations to the subject. The attention has usually been directed to those which were more salient, or obvious to the senses, and not extended so as to comprehend what other subjects have in common, the *ab universis*, so much insisted on by Lord Bacon.

Researches thus conducted appear to me to have as little chance of developing great truths in nature as would the summing up of a judge to instruct a jury, who should restrict his observations to a portion only of the evidence before him.

But if this analogy be imperfect, it is only so in that in medical matters—the *hiatus* of imperfect evidence has too frequently been supplied by not very ingenious conjecture.

Had anyone time, and freedom from preconceived opinions, it does not appear at all impossible to inaugurate a better system, but in most countries, and perhaps now emphatically in England, time and money are convertible terms. The sale of really scientific works does not enable a man to do much, unless he has a more public arena, or more abundant means than have fallen to my lot, or unless he publishes at an expense which may possibly be at the sacrifice of paramount duties. These, and similar considerations, have prevented me from making more attempts than I have done. I regret this because I have received in this country, from the Continent, and, in a very special sense, from America, abundant encouragement to sustain the hope that I had begun in the right path. The details of this encouragement it would be irrelevant to intrude on the reader. Many have said, however—if you cannot carry out your original plan, cannot you give us such a digest of your principles as should enable anyone desirous of doing so, and with more time and opportunity than yourself, to follow in the same path—test your practical precepts, and, if encouraged, cultivate your views, so as to render them more complete.

This seemed reasonable, and I shall endeavour to do it, so far as a careful sketch will enable me in these papers. No doubt they will not afford the opportunity of *demonstrating* what I teach, but they may direct those who are desirous of understanding my views ; and, what I am most desirous of, protect those views from that kind of misrepresentation too common with a certain class of readers who are seldom induced to think seriously on any thing which does not come from some source with which they have been accustomed to associate the idea of "authority."

The papers will necessarily be more or less of a fragmentary character. In a digest it must be to principles that I chiefly direct attention. Then, on practical matters, I write only on what I have myself seen at the bedside, and from these I detach anything which may be too trite to delay the time of the reader.

I am indifferent as to whether anything regarded as new be given to myself or others ; but I am quite aware that some of my conclusions may be, if not startling to the serious student, still opposed to prevailing conventionalisms. I care not how these conclusions may be opposed ; I only desire an examination of the premises on which they rest.

I have lived to see many propositions emanating from myself many years ago, and, negatived by the highest authorities, become, so far as my inquiries have gone, universally adopted.

This is the common lot of most substantial improvements, and when at last they are adopted, it not unfrequently happens that some happy man comes in and engrosses the merit and the harvest of discovery, whilst the pioneer is forgotten.

Differences of opinion, however, instead of exciting uncourteous feelings, would be much more sensibly and generously regarded when viewed as necessary to the development of truth. Scarcely any two men look at a subject from precisely the same point of view ; no man sees the whole at once, but the various phases involved in the different views often, in combination, give the subject that integral form to future investigators, which no individual may have had the good fortune or the ability to discover.

In the principles which I shall endeavour to sketch, however unassailable the conclusions arrived at may be in the abstract, the value of them to me is the power they afford (as I think) of enlarging and improving what is understood by the "Constitutional treatment of disease," and not only of disease, strictly so-called, but the conduct of all other injuries, and the reparative processes they require. I would have everything taken for what it is worth at the bedside. It was there I learned all that I value in practice, and I have endeavoured to test the truth of it on every occasion which offered itself, by the most rigid application of which I am capable, of common sense, or which, in my view, is the same thing, inductive philosophy.

Experience and observation have not only matured my convictions of the soundness of the principles I would advocate, but they have furnished results which I believe to be at present attainable by no other means. I believe that the student will learn to deduce from them a practice

* In using the term medical, I use it in the most comprehensive sense—as including Anatomy, Physiology, Pathology, Therapeutics, Hygiene, &c.

conducted with clearer and better defined objects ; and that a further cultivation of those principles, will achieve successes beyond those at present attainable. I entertain the hope because such successes are suggested on grounds of legitimate hypothesis, which seems to require only further investigation.

I am much more anxious to excite thought than at once to carry conviction.

Before we can achieve anything beyond mere manipulatory art, or a system of mechanical routine, we must learn to hold many things as true, many things as possible, which at present a powerful conventionalism either holds in doubt or practically denies.

At present we conclude that that which we cannot cure is "incurable," which conceals a suppressed premise implying a presumption as to our knowledge, which has been falsified in every science properly cultivated. If this state of mind prevailed, where would have been the recent discoveries in science? Where would the state of organic chemistry have been if, because we could not form organic substances, we had concluded that it was impossible? or where the whole subject of spectral analysis, with the world of facts which it is opening to us, if we had told that nothing was to be done beyond what Newton had taught us? The fact is, we have not cultivated science as we ought. We are, I verily believe, professedly ignorant relatively as to what is "knowable," and on the principle of the *primus gradus sapientiæ est falsa intelligere*, so we shall remain unless we improve our modes, and enlarge the area of our observation.

In admitting that all success is the result of experience and observation, we must not content ourselves with using these terms as a sort of stereotyped platitude, but realise the definition of them as applied in the inductive sense, to the collection of facts, and to the rules of logic, in their application.

That these powers require method is true, yet that the only indispensable assistants are a circumspect patience, industry, and as our quasi spiritual guides, a fearless love of truth for its own sake, and as fearless a freedom from preconceived opinions. We shall, I think, have cause to believe that all examinations of material structure, however useful in many of the mechanical duties of our profession, will never *per se* develop the laws by which the various instruments or organs perform their functions in health, or resist or repair the injuries by accidents or disease. That for this end the most minute examination of parts is only useful as helping us to interpret the phenomena of the body in its integrity. But these phenomena must, as I believe, be noted with greater assiduity than we have as yet, perhaps, been wont to bestow on them. The sort of examination here intended would soon teach us the wide distinction between morbid anatomy and pathology ; morbid anatomy, however indispensable, is only one element, and that by no means the most important in that wide circle of circumspection, which forms the field cultivated by the philosophical pathologist.

Physiology must be cultivated on a much larger idea than that which bases its study so exclusively on anatomy. Anatomy deals only with the apparatus, the instruments in that laboratory in which the chemistry of life is carried on, whilst it in some degree restricts the investigations of the physiologist to what to most is its least attractive, to many its most repulsive, branch of studies. It seems constantly leading men to modes of research, in which both the facts and the conclusions are drawn too much from a *philosophy of sense*, against which we have been so wisely warned by Lord Bacon. Whilst arguments from analogy are brought forward, which, in many cases, are demonstratively unnecessary, and in others deficient in the requisition absolutely indispensable to analogical reasoning.

I will now only add, that I regard no authority but Nature. I have, in my investigations and experience, been guided by what I believe to have been the views of Hunter and Abernethy. My own studies have convinced me that, so far as they had gone, they were truthful interpreters of the facts which had been the subject of their observations, but they left many sequences unobserved from want of time and life for further labour. It is our business to go on in the path, and see by further study how far we can utilize what they left us, by deducing outgrowths of greater power and more definite application.

ON THE TREATMENT OF SYPHILIS BY TOPICAL REMEDIES AND TONICS.

COPY OF A LETTER FROM DR. OWRY TO DR. C. DRYSDALE.

ACCORDING to your request that I should give you a short sketch of my mode of treating universal syphilis, I will not omit to communicate that, without exception, it has been local and partly tonic for the last three or four years. In this way I have treated seventy or eighty patients of my private practice, and the result has proved satisfactory. In order to try this mode of treatment, I was led by my comprehension of "Syphilisation" and "Derivation," both of which methods I have had ample opportunity of studying for several years, and latterly as Assistant-Physician, for three or four years, at the University Hospital for venereal and cutaneous diseases, under the Doctors Hjort and Bœck. I held the opinion that the syphilitic phenomena vanished, not *propter*, but *post* these modes of treatment, which were always connected with topical remedies, and sometimes with tonics and specifics, such as iodide of potassium, and my opinion has proved the right one.

I hold both these treatments to be identical, without influence on the syphilitic organism, and this, although the patients sometimes have been syphilized with matter from hard sores, or secondary affections, especially of late years. My principal remedy is nitrate of silver, that is, used everywhere, where I have to do with ulcerating or secreting products, by whatsoever name they are called, or wheresoever seated. Besides this, patients ought to observe the greatest cleanliness, and take now and then a warm bath. Good and sufficient food, and life in the open air, is desirable.

If there exist any very strongly pronounced anæmia, which is frequently observed at the same time as, and as a consequence of, the syphilitic infection, I have, although not often, prescribed iron. The best tonic is, according to my idea, good diet, and a glass of wine or beer, whereas a too great use of spirits is detrimental. I have never used mercury, partly because I always heard from my principal teacher, Professor Bœck, that it was a "diabolical remedy," which, always on application, led to great risks anyhow, under whatsoever form, and in however small doses it was given ; but partly also, because I did not look upon mercury as necessary, as the phenomena always disappeared of themselves ; and, lastly, on account of my looking upon mercury as a dangerous remedy for the syphilitic economy itself. The most serious and most obstinate forms of the relapses of syphilis, I have always found after the use of mercury. When we reflect that what is intended by all treatment of syphilis, viz.—to bring the phenomena to disappear from the surface of the body, as we hitherto know of no remedy which entirely neutralizes the dyscrasia or infection ; and when we observe that this result is obtained as efficiently without active medication, but solely by expectation, there is no reasonable grounds for introducing into the system a matter with such dubious properties as mercury, although, on the other hand, it cannot be doubted that sometimes several forms of syphilitic exanthems disappear more quickly after it has been used.

But it is no specific at all, and this is more than sufficiently proved by the frequent relapses, and by the offspring of syphilitic women treated by mercury. From a rational point of view, it is also evident that no subacute infection (which might be compared to Virchow's Leucocythema) ought to be treated by a remedy which acts by deteriorating the organism, as is the case with mercury. In cases of syphilitic iritis and choroiditis, with their com-

plications, I have found no other remedy necessary than an early and persevering use of atropiæ and strict use of external antiphlogistics. In hereditary syphilis, I do not find anything else indicated more than a symptomatic and tonic treatment. At any rate, there is not much sense in treating this affection with lowering remedies, such as syphilisation, or mercury—the first affecting the feeble organisation by suppuration, the other, by introducing a new poison into the blood. In treating hereditary syphilis, it must be borne in mind how long since the epoch of the infection of the mother commenced ; the longer time since, the less serious is the infection of the offspring. In mentioning, especially the mother, it is on account of her being, so to speak, exclusively the cause of hereditary syphilis. Without being able to, or wishing to deny the possibility of the father's being the medium of carrying the infection through the semen—the more so as I believe I have observed one such instance—I must, nevertheless, point out, that this, undoubtedly, is a very rare occurrence in hereditary syphilis.

The so-called tertiary forms I treat like the secondary ones—rest, cleanliness, good food, and fresh air, as well as local therapeutics, according to the prescriptions of the surgeon, in cases of sores and tumours, without paying attention to the dyscrasia from which the phenomena are derived. I have found iodide of potassium to be of very little use, and do not, in consequence, look upon this remedy as any specific whatever. The best proof of its insufficiency lies in the numerous substitutes which, for many years, have been proposed and introduced into medicine, each one with claims as to greater effect than its predecessors, but all, in reality, of no consequence.

That gummous knots disappear without the interference of science, is daily observed in post-mortem examinations, when we meet with cicatrices and puckerings after gummata which never have been previously observed during lifetime, and which have never been subjected to any specific treatment. Nervous affections of hyperæsthesic character are better treated by subcutaneous injections of narcotic remedies, than by epispastics or specifics, and, in cases which have an anæsthetic character, electricity and inciting frictions are to be preferred ; as everybody knows, nothing is of any use where the nervous affection is determined by a degeneration of the original elements, or when a neoplasma has developed itself and proved persistent.

The principal element, then, in the treatment of syphilis is patience, and the first and most important point which therapeutists have to observe is to conquer the impatience of patients, whilst they themselves must endeavour to allay their own over activity and eagerness for writing prescriptions. The question of how long the expectant treatment lasts, is a fact of a subordinate character, but it must, on an average, be computed to last about 120 days, as is seen to be the case in all other methods employed. After whatever treatment we use, it is a well-known fact that relapses of a secondary nature usually appear both one and two years after infection. Tertiary forms I have never as yet observed in any of my patients treated in this way, but I do not doubt that they may appear. I adhere principally to the opinions of yourself, Syme, and other anti-mercurialists, with respect to the treatment of syphilis. I must repeat the challenge at the end of your book to colleagues, to try this method with patience and exactness, and must conclude by calling attention to the discussion of this subject which is at present taking place at the Societé de la Chirurgie at Paris, and which is brought forward by the warm spokesmen for this purpose, Messrs. Dolbeau and Deprez. W. Owry.

Christiania, Norway, 6th June, 1867.

A REMARKABLE CASE OF "PURPURIC FEVER,"

WHICH RECENTLY OCCURRED IN THE COUNTY OF CORK.

The following letter, received from Dr. Warren Crooke of Macroom, will best explain the case, of which he gives a particularly clear and concise account. It may be observed that in the report of the Medical Society, published in the Medical Press and Circular of the 5th June, will be found a letter from Dr. Crooke to me respecting a case which I published in the Medical Press and Circular of the 1st May. This has led that gentlemen to further favour me with the following important communication. I have suppressed all references in the MS. which might possibly be construed into a designation of the probable name and residence of the patient. T. W. Belcher.

"24th June, 1867.

"Dear Dr. Belcher,—I have read with much interest the discussion at the Medical Society of the College of Physicians, on the recent epidemic. I send you notes of a case which has excited much interest and surprise in this part of the country. It may, perhaps, strike you that medical aid should have been earlier obtained, but it would seem that this lady's illness did not, at first, alarm either herself or her family. I was sent for on the evening of June 1st, but being in a distant part of the country, was unable to visit until the morning following. She resided in a well ventilated house, in a particularly healthy district, in which no case of a similar character had been observed.—I am, dear Dr. Belcher, truly yours,

"Warren Crooke."

Mrs. ——, of ———, aged 40, was in excellent health on the 30th of May. It being Ascension day, she walked to a neighbouring church for morning service, and in the afternoon walked a mile to meet a lady who was coming to her for a visit. In the evening she complained of a feeling of illness, and of a pain in the left side of her neck.

31st May.—Came down to breakfast looking ill ; she had not slept owing to the pain in her neck, which she described to be confined to the left side under her ear ; the surface in this situation was observed to be of a livid colour, and was tender to the touch. The part was fomented with poppy stupe. She was very poorly during the day ; complained of heavy pains in different parts of her body. In the evening Miss —— observed a small pustule in the centre of the livid patch under her left ear. No general swelling existed in this situation.

The pustule was about three lines in diameter, and raised over the surface about two lines. Miss —— believed it contained matter, and pushed a needle into it, but nothing flowed from it, and the part was so exquisitely tender that Mrs. —— would not permit her to press it. After this she lay for some time on a sofa in the dining-room, and shortly complained of severe pain in her back. She became very restless ; could find no relief in any position; her neck was fomented with poppy stupe ; she had no appetite; was thirsty, and when she drank always felt nausea, but did not vomit.

1st June.—Was unable to get up; had passed a wretched night, tossing about from pain in the left side and nape of the neck, and in her back ; she got up at two o'clock, but presently went back to bed, when she had a fit of shivering, but did not get hot or sweat.

2nd June.—She passed a miserable night, suffering pain in her neck and back ; she slept a little occasionally.

At ten A.M., I visited her ; I could hear her moans from the hall, though she was in a distant room. Not having been prepared for any serious illness, I was shocked at her appearance; her countenance was collapsed; her eyes glassy ; she moaned with each expiration ; she told me the pain in her back (pointing to the lumbar region) was so desperate that she could not help moaning ; she also told me she had severe pain in the left side and back of her neck ; she lay on her right side, and said she could not move without increasing her pains; her pulse was 140, like a thread ; her respiration 35. My attention was directed to a livid patch on the left side of her neck under and behind the ear. The colour was deepest in the centre, where I could observe just a trace of the pustule. The lividity covered, perhaps, the space of a crown-piece, extending for an inch under the hair, and fading away on the scalp. It was rather tender to pressure. I at once decided she was hopelessly ill, and required a consultation. I en-

deavoured to support life with stimulants and nourishment. In the course of the day I met Dr. Gregg, of Cork; he joined me in pursuing the same treatment. In the evening she seemed to rally slightly ; we were both obliged to leave her, appointing to meet next morning. After twelve o'clock she got worse, and I was sent for. On arriving at four A.M. of 2nd June, I found she had died at 1·20 A.M. She had no convulsions; had rattles in her throat for a few minutes before death.

At nine o'clock A.M. I examined the surface of her body. Her skin, which was very fair, had assumed a leaden hue. There were no petechiæ or blotches. The livid patch on her neck was just a little darker than the surrounding skin. I did not after this see her body. As decomposition was rapidly setting in, I ordered that the funeral should take place within forty-eight hours. A very intelligent lady, who saw the body, just within that time, before the coffin was screwed down, informs me that the body was quite black, and I have no doubt of the fact. What caused the death of this lady in four days? Was it not a malignant fever alike to the disease which has existed in Dublin? The acute pain in the loins reminded me forcibly of that which so frequently attends bad cases of confluent small-pox. Was not the livid blotch and pustule on the neck a weak effort to direct a blood-poison to the surface? The case was novel to me and to Dr. Gregg.

No post-mortem examination could be obtained.

Hospital Report.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.

SURGICAL RECORDS,

By WILLIAM STOKES, Jun.,

SURGEON TO THE HOSPITAL; LECTURER ON SURGERY, CARMICHAEL SCHOOL.

ULCERATION OF CARTILAGES OF KNEE-JOINT OF TWO YEARS STANDING; EXCISION OF THE KNEE-JOINT; UNFAVOURABLE TERMINATION OF THE CASE.

NOTWITHSTANDING the energetic and able advocacy for resection of the knee-joint in the Dublin school, the operation is one which all reflecting surgeons must admit to be still *sub judice*. We cannot shut our eyes to the fact that in many of the leading Continental schools of surgery the operation is in disfavour. In Berlin, for example, we see it entirely abandoned by the deservedly eminent Prussian surgeon, Professor Langenbeck, and in the Vienna and Paris school it is also held in disrepute. From Dr. Eben. Watson, formerly surgeon to the Royal Infirmary of Glasgow, we learn that of the eleven operations for excision of the knee-joint that have been performed there up to 1860, only four were successful, of the seven failures, "four died from the effects of the operation, three were submitted to amputation through the thigh, and one of them survived, so that of the eleven patients operated upon six died.* In a recent number also of THE MEDICAL PRESS AND CIRCULAR we were informed by Mr. Holmes Coote, that of the six cases of excision of the knee-joint, which were performed at St. Bartholomew's Hospital last year, three died, and in all cases it was performed at an age most favourable for convalescence and recovery—namely, between infancy and early adult life." In gun-shot wounds involving the knee-joint the results of excision have been still more unfortunate. Of the seven cases recorded prior to the recent American war, only two terminated successfully, and of the eleven cases in which complete excision of the knee-joint was performed during the late protracted war, as recorded in Circular No. 6, a report of the surgical experiences acquired there, and recently published by the American Government, only two were successful, and in one of these the author of the report, Surgeon-General Dr. Barnes, states that the success was "so extraordinary as to suggest some doubt as to its authenticity." We should not forget, however, how very difficult it must be during active military service to obtain the requisite hygienic and surgical resources necessary for the after treatment of such cases.

Notwithstanding these unfavourable statistics, the operating surgeon can always derive encouragement from the records of the cases, collected from various sources by Mr. Butcher, for he will find that of the ninety-one cases in these tables only twenty-five deaths are recorded, and of the remainder, twenty-four were "under treatment," and said to be recovering, and forty-two were "cured." In truth, one chief cause for the ill-success which now so often attends this operation is, I think, that surgeons have too often looked upon the procedure as an alternative for amputation, and very rarely, indeed, as one of expediency. In other words, it is too often deferred until even the propriety of amputation might properly be questioned.

The particulars connected with this case I am about very briefly to record, have suggested these preliminary remarks, for I cannot but think it more than probable, that had the operation been performed at an earlier period, when the vital powers of the patient were not brought to so low an ebb, the chances of bringing the case to a successful termination would have been largely increased.

Susan Hillas, æt. 23, was admitted into the Meath Hospital in last February, having been recommended to me, by my friend and colleague in the Carmichael School, Dr. R. Shaw. Her condition on admission into hospital was truly pitiable. There was great emaciation, an expression of long continued suffering, and much prostration from a continuance of sleepless nights, produced by the often repeated and violent starting pains, so characteristic of the disease, which were present both by day, on making the slightest movement, and also by night, when they occurred with a violence and frequency, which caused her often to scream, so painfully acute were they. The knee, which had been affected in this way for upwards of eighteen months, was not much swollen, being free from effusion, but over the inner side of the joint there was the peculiar elastic, Indian-rubber sort of sensation, which is so often present in articulations affected with much synovial thickening. The joint was strongly flexed, and any attempts to alter its position were wholly unavailing, owing to the extreme pain that they produced. There was no physical sign or symptom of any organic disease elsewhere to be found. Shortly after the patient's admission into hospital, I put her under the influence of chloroform, and extended the leg, and kept it in that position by an apparatus, which I made for the purpose, of Spark's prepared leather. In addition to this, I kept continually applied to the joint the belladonna liniment of the Pharmacopœia, and internally administered frequently opium and cicuta in large doses, during both day and night.

Under this treatment the patient appeared for some time to derive benefit, but it was not permanent, and after trying rest and the other treatment I have already alluded to, for more than two months, and not finding any improvement in the patient's general condition, I determined, should she accede, to have recourse to some operative interference. The patient promptly and positively refused to have an amputation performed, although I expressed my opinion that, owing to her very debilitated condition, I thought the chances of subsequent convalescence would be greater if she selected amputation, in preference to excision, of the knee-joint. To the latter procedure, however, she would only accede. Nor, I confess, was I at all despondent about bringing the case to a successful termination, for there were some features connected with it which, I thought, made the resection of the knee-joint a perfectly fitting and justifiable operation to have recourse to. Among others, her freedom from disease elsewhere, and above all, her youth. Resection, therefore, being agreed upon, the next important question for me to determine was, what line of incision I should adopt. As I was very anxious to pre-

* Glasgow Medical Journal, October, 1859.

serve the patella, should that bone and its cartilage be found healthy, I anxiously considered the propriety of performing the operation by the single longitudinal incision, one great advantage of which is, that the ligament of the patella and its attachment to the tibia can be preserved intact. This line of incision was formerly strongly advocated by Langenbeck and his pupils, and having frequently practised it on the dead subject, I can endorse all that has been said as regards the facility with which the operation can be performed by adopting this method.

It is performed in the following manner :—The limb should be extended, and an incision, commencing a little above the internal condyle, should be brought down on a line with the anterior edge of the internal lateral ligament, as far as the insertion of the sartorius. The knife should be carried down to the bone, the capsule of the joint divided on the inner side of the femur, and the patella then dislocated completely outwards. In this way, a complete view of the internal structures of the joint is obtained.

The crucial ligaments should then be divided, and the joint forcibly flexed, and the external lateral ligament divided. The remaining steps of the operation can be performed in the ordinary manner.

This method, however, has not been attended with as favourable results as the old H-shaped incision, and accordingly I determined to adopt this. It would have been quite useless (as I found on opening the joint) to attempt preserving the patella, for the bone, as well as the cartilage on its posterior surface, was extensively diseased.

During the operation, which, assisted by my colleagues Messrs. Porter, Collis, and Wharton, I performed on the first of last May, three vessels, two of considerable size, had to be secured, which I accomplished by acupressure, adopting the methods of quarter and half rotation, or first and second varieties of the fifth or Aberdeen method. The hæmorrhage was perfectly arrested by this. There was considerably more disease in the joint than I had anticipated. The synovial structures were pulpy, thickened and gelatinous, and there was extensive ulceration of cartilage. The case was, in truth, a typical example of ulcerative action in articular structures. This was especially well-marked over the inner condyle, the cartilage of which was much eroded, as was also the bone. The same condition was observed on the corresponding facet on the head of the tibia ; and, as was before mentioned, the cartilage on the posterior aspect of the patella, was extensively engaged. There was intense vascularity of all the structures of the joint.

After the operation was concluded, the limb was put up in the ordinary manner in Butcher's box, and a powerful anodyne administered at once.

3 P.M.—Found patient in a state of great excitement and hysteria. Heart's action fluttering, and very excited. Impossible to estimate accurately the rate of pulse. Complains of great starting in limb. Ordered an anodyne, with forty drops of Battley's sedative.

10·30 P.M.—Quieter ; excitement abated ; has had a little sleep ; feels drowsy ; does not complain of startings or pain.

May 2nd, 10 A.M.—Pulse 140 ; great gastric irritability ; vomits everything ; ordered iced soda-water, hydrocyanic acid and champagne.

9 P.M.—Has had another very severe fit of vomiting ; nothing remains on stomach ; pulse 150, weak and compressible ; appears to be sinking ; ordered a draught containing sol. mur. morphiæ, gtt. 35 ; acid hydrocyanici, dil. gtt. vi. ; brandy, ℥i., in two tablespoonfuls of iced soda-water ; and also a small blister to the pit of stomach.

3rd.—Great change for the better ; had some hours sleep ; countenance cheerful ; retching and vomiting ceased ; pulse 112 ; to continue the iced beef-tea and champagne in small quantities at a time.

4th.—Dressed the wound for the first time ; edge of anterior portion of flap united ; all going on well.

6th.—No return of gastric irritability ; pulse 120 ; tongue moist ; appetite good ; copious suppuration from the wound ; removed two of the points of suture ; transverse wound united completely.

It would be tedious to continue the daily report further. For upwards of a fortnight after the last report, notwithstanding the extremely hysterical and irritable temperament of the patient, everything appeared to promise well. The suppuration in the wound continued to diminish sensibly ; the appetite also improved, and the patient had better nights ; at this time I was most sanguine in believing that the case would be brought to a successful termination ; my colleagues were also of this opinion. At this stage, however, grave pulmonary symptoms manifested themselves—the pulse rose, and night perspirations, and other evidences of a hectical condition were developed.

On the 6th week the pulmonary symptoms, which exhibited all the usual phenomena of acute tuberculosis, became much aggravated, and it became evident that the end of the patient was rapidly approaching. Notwithstanding, however, her critical condition, the wound continued to improve up to the last week of her life ; but on this week, the seventh after the operation, she gradually sank, and died on the 15th of June.

In considering the features of this case, I cannot avoid coming to the conclusion, that had the operation been performed at an earlier period of the disease, before the patient's vital powers became undermined by long continued suffering, the result would have been probably very different, and I regret—and think it right to record that regret—that I did not perform the operation when the patient first came under my care at the end of last February. We should not wait until reaction becomes nothing more than an alternative for amputation. "Do not the very circumstances," observes Dr. Watson of Glasgow, "which demand the amputation, diminish the likelihood of success from excision ? Surely, then, the two operations ought not to be canvassed at the same time. If it is the time for amputation, then it is too late to attempt the salvation of the limb by excision ; and if the latter course is at all a desirable one, then ought we to pursue it before the patient's case has become well-nigh desperate. I believe it has been by acting too rigidly on the opinion that excision was a mere substitute for amputation, that we have had such poor success with our cases in Glasgow, and if I am not very much misinformed, surgeons elsewhere have not so acted, but have chosen cases for excision that were by no means *ready* for amputation. I think that we should do so too—that we should select patients who have some health and strength to work upon, as the subjects of this operation, and not those who are already sinking into the grave."

In concluding this brief record, I should be failing in duty were I to omit expressing my warm thanks to Messrs. Cooke, Locke, and Crosslé, our clinical assistants in the surgical wards of the hospital, for the care, and untiring zeal and energy they have shown, not only during the progress of the case I have just recorded, but in all those they have had under their care since they were appointed to the offices they now so worthily occupy.

Foreign Medical Literature.

INVESTIGATIONS RESPECTING ARTERIAL DILATATION AS A RESULT OF NERVOUS IRRITATION.

By Dr. CHRISTIAN LOVEN.

TRANSLATED FROM THE "HYGIEA" FOR NOVEMBER, 1866, P. 425.

By WILLIAM D. MOORE, M.D., Dub. et Cantab., M.R.I.A.;

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS; OF THE NORWEGIAN MEDICAL SOCIETY; AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; EXAMINER IN MATERIA MEDICA AND MEDICAL JURISPRUDENCE IN THE QUEEN'S UNIVERSITY IN IRELAND.

(Continued from page 17.)

4.—*Remarks on the foregoing experiments.*

IRRITATION of a sensory nerve thus always gives rise to changes in the pulsation of the heart. Commonly the latter

becomes slower, and, moreover, dilatation or contraction of the bores of the arteries is produced. According to the experience of all investigators, it is beyond all doubt that the phenomena mentioned, exhibited by the muscles of the organs of circulation, are produced in a reflex mode. Likewise, according to my observations, we cannot entertain a doubt that relaxation in the muscular structure of the arteries cannot take place independently of a preceding stronger contraction of the same. According to the current physiological views, we must therefore say that sensory irritation is capable, by reflex action, both of elevating and depressing the tone of the vascular nerves. We have not, however, as yet arrived so far as to be able to predict in what cases sensory irritation shall have an augmenting or restricting influence upon the contraction. From my researches only thus much seems to follow, that the dilatation occurs much more locally than the contraction. Wherever irritation was established, an increase of the pressure of the blood always took place, which, as where the vagus was uninjured it was accompanied with retarded pulsation, could depend only on an increase of resistance in the channel of the circulation. The dilatation was at the same time confined, without exception, to the arteries whose course lay within the domain of the irritated nerve, or at least in the vicinity thereof. It has already been remarked above that irritation of the auricular nerve on one side, usually dilated only the arteries of the corresponding ear. However, the cases were not very rare in which also the ear of the opposite side became redder. Among many experiments, I have, moreover, once seen irritation of the infra-orbital nerve produce redness in the ear, and in the same animal an irritation of the central stump of the brachial plexus cause a weak but distinct relaxation of the auricular arteries. On the other hand, I have never seen the vessel-dilating influence of the lumbar or sacral plexus extend to the ear.

Upon this supposition, we cannot mistake, in the whole series of phenomena developed after irritation of a sensory nerve, the character of that conformity to an end which so surprisingly manifests itself in all reflex processes. In the great majority of cases it must have a favourable influence on the irritated part, that it should be traversed by a full and rapid stream of blood. Only thus can the injurious effects of greater differences of temperature, compression, &c., be neutralized. A current of blood thus locally altered must arise if the small arteries in the irritated part are dilated, while all the others are contracted; and a too considerable increase of the pressure of the blood is prevented, if, at the same time, the pulsation of the heart becomes slower.

The point in the nervous central parts, where the transition of reflex actions takes place, seems to lie, not in the spinal cord, but in the medulla oblongata. At least the experiments of von Bezold are in favour of this view, when, upon irritation of sensory nerves, he no longer observed any increase of the pressure of the blood, if he irritated a sensory spinal nerve, after the cervical medulla was divided. With this seat of the reflex focus, perhaps the exceptional position occupied by the vascular nerves in another respect also agrees. Van Deen was the first to show, that by irritation of a transverse section of the spinal cord, the nerves arising below the same never can be excited. To this it is well-known that the vascular nerves most decidedly form an exception—a circumstance which is perhaps connected with some different arrangement of these nerves in the spinal cord.

From von Bezold's experiments, we might further be inclined to conclude, that the reflex actions, which are attended with a diminution of the tone of the vascular nerves, are arranged in the medulla oblongata, and that those on the contrary, which are connected with an increased tone, occur first in the cerebrum; supposing that the augmentation of pressure observed in his first experiment should be attributed to a contraction of the vessel, and, on the other hand, the independent sinking of the pressure to relaxation of the vascular muscles. But to decide this question, continued experiments would be necessary as to the state of the vessel in each particular case.

If we try to penetrate still more deeply into the connection of the phenomena, we soon find ourselves surrounded by a number of alternatives incapable of solution. The fact, that by irritation of the same nerve trunk, at one time dilatation, and at another contraction of the vessel occurs, may be caused, however, by different kinds of fibres contained in the sensory or motor trunks, and by different localities and kinds of movements for the reflex apparatus. But as I am not in a position to decide which of these possibilities is the correct one, I shall not further sketch my ideas on the subject. We must for the present be satisfied with having established the fact, that the contraction and dilatation of the arteries do not stand to each other in the same relation as effort and exhaustion, or as the phases of an oscillation.

Recollecting the extreme importance which the process in question has for the pathological bearings of physiology, it is evident that zealous investigations upon the subject must continue to be made.

5.—*Dilatation of the branches of the arteria profunda penis through the influence of the nervi erigentes.*

The dilatation of the arteries of the penis in consequence of irritation of a peripheral nerve trunk, deserves our attention in a double point of view; on the one hand, for the results which occur in the organ traversed by the distended current of blood; but on the other, also, for general reasons.

With respect to the theory of vascular dilatation in general, it would, in the first place, be desirable to know whether the processes active in the dilatation can be explained in accordance with the principles of the contraction theory or not. If we endeavour to ascertain the means at our command for the decision of this question, they are certainly very limited, for there is, in fact, only one—namely, the demonstration of a nervous apparatus acting tonically, and situated between the dilating nerve and the muscles. From analogy with the heart, we believe ourselves justified in assuming the existence of such a tone-giving organ, if ganglionic cells are scattered in a nerve shortly before its peripheral termination.

In the salivary glands, in which it is well-known that Cl. Bernard discovered the dilating nerves, ganglia lie along the course of the nerve. All the phenomena in these organs with which we are acquainted, are sufficiently explained by the assumption that tone is imparted to the vessel partly from the brain through the sympathetic, and partly from the ganglia met with on the glandular nerves. If, now, the tone-giving action of the ganglia be annihilated by the dilating nerves (the facial, &c.), the vascular walls yield to the urgency of the pressure of the blood.

Some years later, Eckhard showed that from the sacral plexus two nerves proceed, by the irritation of which the current of blood through the penis is exceedingly promoted, and in fact, it would be difficult to find any point in the animal body which more markedly exhibits the acceleration of the circulation under the influence of nervous irritation. On the other hand, Eckhard has, in his remarkable investigation, left us in uncertainty as to the mechanism on which this phenomenon is founded, as he neither could demonstrate the dilatation of the arteries, nor discover any ganglia in the penis.

By close anatomical investigation of the penis in the dog, I have now succeeded in discovering numerous ganglionic groups along the course of the nervi erigentes, the description of which I shall here add:—

Of the nerves running along the membranous portion, only those found on the lateral and posterior (superior) surfaces belong to the nervi erigentes; irritation of the anterior does not produce erection, nor does their division hinder its occurrence. Both these effects are, on the contrary, produced by a corresponding interference with the nerves running on the superior and lateral surfaces of the mem-

branous portion. Now, these may, for the greater part, be traced to the nervi erigentes described by Eckhard, proceeding from the sacral plexus; through another portion they are in connection with the hypogastric plexus. The plan of the sub-division of the same, corresponds to the representation given by J. Müller* of the nerves in the corresponding part in man.

The lateral trunks run parallel to one another, and are for the most part isolated, merely the filaments lying nearest to the anterior (inferior) surface of the membranous part, uniting with the fibres of the nervus pudendus, which run from this nerve on the anterior side of the urethra towards the prostate. The lateral fasciculi can be traced as far as the point where the arteria profunda penis, on the side of the bulb of the urethra, resolves itself into its terminal branches, and there form, together with branches of the pudic nerve, an extremely dense network. From this some of the fibres penetrate with the vessel into the corpus cavernosum urethræ, others spread out in the walls of the artery of the bulb and its larger branches, where they can be followed into the muscular layer. The fibres resemble bundles of connective tissue, but are still stronger, undulating, and extremely pale, and consequently can be made visible only by acids, or by colouration with carmine.

The posterior bundles from both sides anastomose freely with one another, and form a plexus which lies directly on the muscular coat of the urethra; they soon cease to be traceable, inasmuch as they enter into the extremely dense connective tissue, copiously supplied with elastic filaments, found in the posterior part of the bulb, immediately in front of the musculus bulbo-cavernosus.

I have met with ganglia and ganglion-like formations in the following hitherto unknown situations:—1. On the posterior surface of the membranous portion of the urethra; they occur to within some few lines distance from the posterior boundary of the bulb, but are particularly abundant in the depression between the prostate and the urethra. The ganglionic cells lie either singly or united into groups; in form they are either ordinary ganglionic cells, with abundant, yellowish, granular protoplasm, or are of peculiar formation. 2. In the dense connective tissue in the posterior (superior) part of the bulb lie ganglionic cells with scanty, very pale, finely granular protoplasm, in larger or smaller groups or also singly among the nerve-filaments. 3. In the net-work formed by the lateral bundles of the nervi erigentes around the vessel on the side of the bulb, lie peculiar enlargements of the pale nervous fasciculi, which are filled with numerous nuclei, and a very pale, finely granular mass.

The vivisectional investigation of erection in the dog, to the results of which I now pass, loses, through the employment of curare, the repulsive character it would otherwise, in so high a degree, possess. We must, therefore, regard it as fortunate that all the phenomena exhibited by the circulation in the penis of a healthy animal, continue unchanged notwithstanding very intense poisoning.

A.—Of the changes in the penis, which accompany the acceleration of the circulation produced by irritating the nerves of erection.

The assumption that the normal contraction of the trabecular muscles of the penis, should be the cause of the rapidity of the circulation in that member being incapable of reaching its full development, has already been refuted by Eckhard. This he accomplished simply by cutting through the cavernous tissue in different places. If, after this was done, the nervi erigentes were at rest, the hæmorrhage on the cut surface was very moderate; but if these nerves were thereupon irritated on one or both sides, a strong current of blood issued from the divided caverns. As it is evident that the divided walls of the latter could not have made any resistance to the stream of blood, the increased hæmorrhage must be attributed to the direct influence of the nervi erigentes.

(To be continued.)

Loch Katrine ...	FEBRUARY. Glasgow.	3·28	·256	·031	·002	·041	0	0·3

For the purpose of comparison, I append also the results yielded by Lock Katrine water, as supplied to Glasgow, when submitted to the same analytical processes. The numbers in columns 3, 4, 5, 6, 7, 8, and 9, all relate to 100,000 parts of the waters. The table is to be read thus: 100,000 lbs. of Chelsea water collected on June 1st at the Horse Guards cab-rank contained 28·28 lbs. of solid impurity; the organic matter constituting a portion of this impurity contained ·261 lbs. of carbon. This solid impurity also contained ·214 lbs. of nitrogen in the form of nitrates and nitrites, besides ·004 lb. of ammonia, whilst the total amount of *combined* nitrogen in every form was ·217 lb. The above quantity of water supplied by the Chelsea Company had been, after its descent to the earth as rain, contaminated with sewage or manure matter equivalent to 1158 lbs. of average filtered London sewage.

By gradual oxidation, partly in the pores of the soil, partly in the Thames or its tributaries, and partly in the

reservoirs, filters, and conduits of the Company, this sewage contamination had been entirely converted into comparatively innocuous inorganic compounds before its delivery to consumers. Finally, 100,000 lbs. of the Chelsea Company's water contained 20·3 lbs. of carbonate of lime, or an equivalent quantity of other soap-destroying ingredients.

The above analytical results show that the water of the West Middlesex Company, drawn from the stand pipe at the cab-rank in Portland Road on the 1st inst. was contaminated with sewage (*present* sewage contamination); for, if the amount of nitrogen existing as nitrates, nitrites, and ammonia (·318 part) be deducted from the total combined nitrogen, there remains ·103 part, which must be *organic* nitrogen, equivalent to 1030 parts of average London sewage in 100,000 parts of the water, or rather more than one per cent. The water was turbid when drawn, and after standing for a few days emitted a very offensive odour, and became filled with white flocculent matter resembling that which gradually deposits from filtered sewage. A few days later this odour disappeared. In answer to my inquiries the engineer of the Company informs me that a breakage had occurred in one of the Company's mains in an adjoining street, and near a gully-hole. This fracture, which was repaired on the 3rd of June, soon after its discovery, happened to a main from which the water pressure was removed at night, and it is believed that, during this absence of pressure, sewage commingled with the contents of the main. It is gratifying to find this satisfactory reason for believing that the contaminated water was delivered to a small district only, and for a short time; but the accident supplies another item to the already long list of dangers attending an intermittent supply of water. On the *constant* system no sewage contamination arising from such a cause could occur. On taking a sample from the same source on the 7th inst. I found the water restored to the usual condition of normal Thames water.

The water of the Southwark Company was turbid when drawn from the main; and that of the East London Company very slightly so.—I have the honour to be, sir, your obedient servant, E. Frankland.

The Registrar-General, &c., &c.

HARVEIAN SOCIETY OF LONDON.
COMMITTEE FOR THE PREVENTION OF VENEREAL DISEASE.

Dr. J. E. Pollock, President.

At a meeting of the above Committee on June 13, the following reports were read by the Honorary Secretary:—

The report from the Holloway and North Islington Dispensary shows that in the year ending March 25, 1867, the total number of venereal cases treated, including infantile syphilis, was 130.

The result of the investigation of the Manchester Medical Society has been as follows, according to a letter from Dr. E. Morgan—"In the course of the three years, 1864–65–66, out of an average number of 75,000 patients seen, the average number of cases of constitutional syphilis in Manchester and Salford was 1750, to which adding an average proportion of the number of cases of skin diseases, say 950, and also an average number of cases seen at the Lock Hospital, 800, we thus arrive at the result that the average number of new cases of constitutional syphilis seen yearly in Manchester and Salford does not fall short of 3500. These returns are from public practice alone. The population of Manchester and Salford was, in 1861, 390,000.

The Lock Hospital, Manchester, has a daily average of 76 cases of venereal diseases, in-and-out patients, seen at that hospital, and about 20 in-patients.

The Ardwick and Ancoats Dispensary reports a daily average of eight venereal patients seen—in the proportion of one to eight of its surgical patients. The Southern Hospital, Manchester, sees a daily average of four venereal patients, or in the proportion of one to eight of its surgical patients. The Chorlton and Medlock Dispensary sees a daily average of three venereal patients, or about one-third of its surgical patients are venereal. The Manchester Workhouse, Bridge-street, has a daily number of 91 venereal cases, or about one to eight of its surgical cases. There are fifteen beds for male venereal cases, and forty-six for females, all for primary cases. The Salford Workhouse sees daily 9 male and 63 female venereal cases, in which there are 39 cases of infantile syphilis included. This is nearly one-third of its surgical patients. There are six beds for primary syphilitic cases in females—none for males. The Salford Hospital and Dispensary, Manchester, sees daily 18 venereal cases, or about one to twelve of its surgical cases are venereal. It has no lock beds. St. Mary's Hospital, Manchester, sees daily an average of three and two-thirds males, and 14 female venereal patients, or about one to ten of its surgical cases are venereal. No lock beds. The Clinical Hospital for children, Manchester, sees daily on an average three children with syphilis, or about one to twenty-six of its cases are so affected. No syphilitic beds. The Bridge-street Children's Hospital, Manchester, sees daily on an average one male and three female venereal cases, or as one in thirty-three of its patients. No lock beds. The New Burgh Gaol, Manchester, has a daily average of 10 venereal patients, or as 62 is to 100 of all its surgical patients. No lock beds. The New Bailey, Manchester, has a daily average of 11 males and 3 female venereal cases, or 42 per cent. of its surgical cases. No special beds for venereal cases. The Eye Hospital, John-street, Manchester, has a daily average of 10 venereal cases, or about 1 to 20 of its cases are venereal. Manchester Royal Infirmary has 23 male and 22 female venereal cases daily, or about 1 in 10 of its surgical cases. No lock beds. The Chorlton Union Workhouse, Manchester, has a daily average of 7 males and 14 venereal females, in the proportion of 1 to 9 of its surgical patients. There are twenty female lock beds, and a few beds for males distributed through the surgical wards.

In a letter from Dr. Bradley, that gentleman says—"We are fully convinced that the quacks and chemists attend a large proportion of the entire number of venereal cases occurring in Manchester." . . . "And secondly, we have included medical as well as surgical patients in our returns, as with us venereal cases come under medical treatment quite as frequently as under surgical." . . . "The Committee consider it worthy of note that the greatest average is found amongst the lowest classes of the community, and that our gaols and workhouses, which *a priori* we would expect to furnish the greatest amount of vice, return the largest percentage of syphilis, &c." . . . "Our Committee feel assured that the above statistics give the minimum number of cases of venereal diseases existing in Manchester, that, in all probability, the evil extends to a much greater extent than can possibly be ascertained by any public enquiry, that it effects a positive injury on the national physique, and that the steps which your society are taking are urgently called for, and merit every legislative support." The statistics given by the same gentleman give an average of 387 venereal cases seen daily in Manchester in public practice, or in the proportion of about 1 to 7 of the whole daily patients seen, both medical and surgical.

The report of the sub-committee was read by the Honorary Secretary (see Medical Press and Circular, July 3, 1867), after which,

Mr. Holmes Coote rose to express his admiration for the way in which the report was written. It was most readable and well expressed, and calculated to do great service. He could not help again expressing his conviction of the necessity for the registration of all brothels, and the inspection of these houses. Recently a young girl aged seventeen had been brought to him at St. Bartholomew's hospital with entire loss by sloughing of her external genital organs. The poor girl, who was very attractive, had been kept by the mistress of the brothel where she lived in a constant state of intoxication, and made to submit to intercourse with a crowd of men; and there was no doubt that such cases cried aloud for government inspection of brothels. Such a girl was at first rated as in the first-class, but by the time she had contracted disease and been salivated, she passed into the second, and then third class; and he, therefore, urged the necessity of surveillance over these brothels. Again, he objected to the words Lock Hospital, or foul wards, altogether; and thought it was time that such degrading names should no longer be attached to diseases, which were so often caused by accidents. It would be better to admit women into workhouse hospitals, instead of into special lock hospitals, and thus the women would more easily go in

than they now did. Lastly, when prostitutes went into reformatories there should be some sort of medical treatment for them whilst there. At present, when diseased, they were sent back to the lock hospital, or other hospital, when found to be ill.

Mr. ACTON thoroughly admired and concurred in most of the sentiments contained in the report. He had been in Paris only a few days before, and had been present at the examination of the prostitutes at the dispensary. Of no less than 150 women he saw examined, belonging to the registered women, not one was diseased. Their hands were examined, their throats, and then the genitalia. Very few of the women are now ever found to be diseased. Being curious to understand how it was that they were never ill, he asked one of them the reason; she replied that it was needless to examine her, as she had been there for years and had never been found ill. The truth was, Mr. Acton said, that, in the first place, the organs of generation were so completely hardened, as in many cases the vaginal mucus membrane resembled the epidermis; and, secondly, as the women knew that it was quite impossible to escape from examination, and being sent to St. Lazare, if diseased, they examined every man who came to the house, and if he was found to be diseased he was sent away at once. But there was one remark he (Mr. Acton) would make, and that was, that it was not the women who had the severest ulcerations on the genitals who was the most dangerous—such a one was seldom inclined to follow out her trade. It was that woman who had the smallest ulceration who was the most dangerous, or, in other words, the slightest cases were the most formidable. The great amount of infection was spread in Paris by the unregistered women who frequented balls, &c., and were not under any police control. It was impossible to know beforehand how many beds were requisite for prostitutes, since, when registration was once carried out, a very much smaller number of beds were soon required. He was very anxious that we should first try the voluntary system without registration, supplying plenty of beds for all diseased women. Lastly, the term foul wards was an abomination. At the time when the term mad doctors, &c., was in fashion, it suited the rudeness of the age, but ought now to be laid aside; and he thanked the Committee of the Harveian Society for having made this subject one which could be calmly and scientifically discussed in a body of scientific men, and thus make it possible to arrive at some conclusion. The religious party, however, were yet to be encountered. He was, and had always been, in favour of a large extension of beds.

Dr. CHAPMAN thought that religious prejudice was rapidly giving way. Like Mr. Acton, he still remained greatly opposed to the forcible registration and examination of prostitutes. He thought that an appeal like this Report would come home to the selfish fears of the public, and might prove effectual enough in arousing them from their apathy, and stimulating them to the voluntary treatment of venereal cases, without any such obligatory measures. He thought, too, that Parliament would be ready enough to grant money for hospital accommodation, but not for registration of prostitutes. He quite agreed that the word lock, or foul hospital and wards, should be given up; the more the suffering was disassociated from any ignominous terms, the more easily could the disease be treated and prevented.

Mr. WALTER COULSON said that the first requisite was to obtain increased hospital accommodation. It is the cases which are not taken into the Lock which are the most dangerous. For example, a young attractive prostitute came for three months to the Lock Hospital, suffering from a small ulceration of the genitalia, which, by rest and astringents, ought to have been well in a week or two. But, during the whole of this time she was noticed by some of the students to be carrying on her trade, being seen frequently at Cremorne and elsewhere. No wonder the ulcer did not heal in such a case. As to voluntary efforts, his opinion was, that in order to do any good, registration must be adopted, both for the women and the brothels. Nothing else would be effectual, and it was well-known that the better class of prostitutes, who infected the members of the middle and upper classes, were treated by chemists, &c., and did not come under the notice of the regular practitioner. His opinion was that prostitutes and brothels should all be licensed.

Mr. ACTON observed that in Paris almost the whole of the diseased women were found among those who could not be registered, because unknown.

Mr. W. COULSON said that, as a rule, women who went to asylums were sent back to the Lock Hospital when diseased, and some sort of medical treatment should be used in these asylums. Some of the 150 women spoken of by Mr. Acton must have had disease in the vagina, but escaped detection.

Mr. TEEVAN said it was true enough, as stated by Mr. Acton, that the richer and clandestine women escaped detection in Paris; but he had shown the immense benefit of registration and examination by his own account, as far as the other women went. Now, these women in this country infected one of the most important classes of our society—the working classes, and thus deteriorated the very bone and sinew of the nation. It was not, he thought, so very important to protect the wealthier classes, who could do so for themselves; but the poorer, who were so extensively attacked by these dangerous diseases, could be protected by registration of prostitutes.

Mr. R. W. DUNN had recently been in Portsmouth, and had found that, whilst the lower class of prostitutes, who had been put under the Act of 1866, were remarkably free from disease, the genteeler classes of prostitutes, who as yet had not been registered, were severely diseased. He had been informed of this by a woman, the keeper of one of the richer class of brothels in Portsmouth.

Dr. TILBURY FOX thought that some of the observations had fallen from gentlemen who had scarcely watched the proceedings of the committee from meeting to meeting. The main question was how to get legislation. The success of the operation of the Contagious Diseases Act suggested the application of a like principle of legislation to the civil population. The Committee wished to recommend a moderate kind of preventive legislation, and one likely to be adopted; and they did not wish it to be considered that the measures they suggested were final, or so complete and extensive as they thought really necessary to secure the prevention of venereal disease. They recommended a plan likely to meet with favour.

Dr. MENZIES was greatly in favour of registrations and examinations of prostitutes, both of which had been found so serviceable in the Army. They were for the benefit of the women as well as of the men. The name *Lock* wards and hospital might be exchanged for *specific*. He was much in favour of establishing asylums.

The PRESIDENT observed that Dr. Menzies' recommendations were all embodied in the report just read to the Committee.

Mr. WEEDEN COOKE said that there was a special class of the community to be legislated for in this case, and, for his part, he was much more in favour of a voluntary than of a compulsory system of examination. There was a most crying necessity for the extension of hospital accommodation for these poor diseased women; and, having had extensive experience in this matter, he would only say that the women would be but too happy to go in if there were beds open for them. There was no class of women more amiable than the prostitutes. They had only one great vice, but this seemed usually to have swallowed up all the other vices, and they had not the least desire to infect men if they only were allowed to get into a place of shelter, but at present their necessities compelled them to go on with their trade, even when in the most contagious states.

Dr. DRYSDALE said that he had much wished, in company with Dr. Chapman, Mr. Acton, Mr. Weeden Cooke, and Dr. Beigel, that the committee should have recommended first of all that an immense voluntary system should have been tried; but the majority in favour of registration had been overwhelming. As it had been decided that there was to be no "representation of the minority" in this matter in the report of the Committee—a decision which he could not but think, by the way, was needless—since the Committee was only a deliberative, not a legislative body, it would go forth that the Society was unanimously in favour of registration and compulsory examination of prostitutes, and consequently he supposed that, if society at large was of the same opinion as the majority of the Committee, this experiment might soon be tried. At the same time, the evidence of Mr. Cooke, Mr. Acton, Dr. Beigel, and Dr. Chapman was deserving of attentive consideration, which he had no doubt it would receive at the hands of the Legislature. There was one point on which there was perfect unanimity, and that was that the present hospital accommodation for prostitutes was most inadequate, and he was glad to hear that the new London workhouse hospitals were to have ample provision for venereal cases.

CURRENT LITERATURE.

THE *Glasgow Medical Journal* opens with a clinical lecture by Dr. W. T. Gairdner, treating of the Physical

Diagnosis of Cardiac Disease, apart from murmurs and special valvular lesions. The region of diagnosis that lies between symptoms and physical diagnosis, is here surveyed by a teacher whose claims to attention have long been undisputed, and we doubt not that far beyond the sphere of his own work this lecture will be studied and turned to account. The Journal further contains a case of dislocation of the hip, by Dr. Cameron; another article on the same subject by Mr. Joseph Bell, a case of idiopathic myelitis, by Dr. Black, and notes on a needle for fissure operations by Dr. MacLaren. The clinical record and report of the Medico-Chirurgical Society is also continued.

Under the title of *Clinical Lectures on Skin Diseases*, Mr. Balmanno Squire has published a smaller and cheaper edition of his coloured photographs of diseases of the skin. This will render these illustrations accessible to all. The smaller size will no doubt be preferred by many. It is small quarto, and, when complete, will be a beautiful and portable atlas. The photographs we have seen are well executed, and the colouring true to nature.

Mr. Hilton's *Hunterian Oration* for 1867, which we noticed at the time of its delivery, has now been "printed at the request of the President and Council," and published as a pamphlet by Messrs. Bell and Daldy. In this form we have no doubt it will be extensively read, as, indeed, it deserves to be. We hasten our notice of it in order to induce our readers to peruse it at once.

The Mixture Book, by A. J. Cooley, the author of the well-known Cyclopædia of Practical Receipts, forms part II. of the prescriber's and dispenser's vade-mecum, or general hand-book of compound medicines. The first part of this series was called the *Pill Book*, and has already been noticed. The present handy little volume contains all the mixtures of the pharmacopœias, those of the leading hospitals, a selection from foreign formularies, and a large collection of those of leading practitioners, besides an account of the more common "quack medicines." The whole is arranged alphabetically according to the English names. The Latin names and synonyms follow. The quantities are stated in proportional parts, and the doses and other items are given. No more experienced a compiler than Mr. Cooley could have been found, and Mr. Hardwicke has got up the work in a manner that makes it a cheap shilling's worth.

The new number of the *Westminster Review* opens with a remarkable article, evidently from the pen of an experienced naturalist, on "Mimicry, and other Protective Resemblances among Animals." The word *mimicry* in this article is not used in the sense of voluntary imitation, but to express a particular kind of resemblance that may easily deceive the eye, and by so doing serve to conceal the animal, or otherwise protect it from its enemies. It is maintained by the author that Nature does not descend to meaningless imposture, but that the imitations serve a very important purpose—that of greatly assisting in the preservation of the species. This protective resemblance would, to some extent, account for the uniformity in colour of the vegetable kingdom compared with the immense varieties of the animal world. But even the colours of flowers would follow the same general law sketched out in the *Westminster*, since the writer subscribes to Mr. Darwin's opinion that their beauty is owing to the necessity of attracting insects to aid in their fertilization. It is impossible to do justice to this article in the space at our disposal. We have accordingly marked a few passages for quotation as opportunity may occur, and refer the reader to the quarterly journal under notice. We offer this week a few extracts that will show the author's idea:—

"Desert animals as a rule are desert-coloured. The lion is a typical example of this, and must be almost invisible when crouched upon the sand or among desert rocks and stones. Antelopes are all more or less sandy-coloured. The camel is pre-eminently so. The Egyptian cat and the Pampas cat are sandy or earth-coloured. The Australian kangaroos are of the same tints, and the original colour of the wild horse is supposed to have been a sandy or clay-colour.

"The desert birds are still more remarkably protected by their assimilative hues. The stonechats, the larks, the quails, the goatsuckers, and the grouse, which abound in the North African and Asiatic deserts, are all tinted and mottled so as to resemble with wonderful accuracy the average colour and aspect of the soil in the district they inhabit.

"Almost equally striking are the cases of arctic animals possessing the white colour that best conceals them upon snow-fields and icebergs. The polar bear is the only bear that is white, and it lives constantly among snow and ice. The arctic fox, the ermine and the alpine hare change to white in winter only, because in summer white would be more conspicuous than any other colour, and, therefore, a danger rather than a protection; but the American polar hare, inhabiting regions of almost perpetual snow, is white all the year round. Other animals inhabiting the same Northern regions do not, however, change colour. The sable is a good example, for throughout the severity of a Siberian winter it retains its rich brown fur. But its habits are such that it does not need the protection of colour, for it is said to be able to subsist on fruits and berries in winter, and to be so active upon the trees as to catch small birds among the branches. So also the woodchuck of Canada has a dark brown fur; but then it lives in burrows and frequents river banks, catching fish and small animals that live in or near the water.

"Among birds the ptarmigan is a fine example of protective colouring. Its summer plumage so exactly harmonizes with the lichen-coloured stones among which it delights to sit, that a person may walk through a flock of them without seeing a single bird; while in winter its white plumage is an almost equal protection. The Snow-bunting, the jerfalcon, and the snowy owl are also white-coloured birds inhabiting the arctic regions, and there can be little doubt but that their colouring is to some extent protective.

"Nocturnal animals supply us with equally good illustrations. Mice, rats, bats, and moles possess the least conspicuous of hues, and must be quite invisible at times when any light colour would be instantly seen. Owls and goatsuckers are of those dark mottled tints that will assimilate with bark and lichen, and thus protect them during the day, and at the same time be inconspicuous in the dusk.

"It is only in the tropics, among forests which never lose their foliage, that we find whole groups of birds whose chief colour is green. The parrots are the most striking example, but we have also a group of green pigeons in the East; and the barbets, leaf-thrushes, bee-eaters, white-eyes, turacos, and several smaller groups, have so much green in their plumage as to tend greatly to conceal them among the foliage.

"The conformity of tint which has been so far shown to exist between animals and their habitations is of a somewhat general character; we will now consider the cases of more special adaptation. If the lion is enabled by his sandy colour readily to conceal himself by merely crouching down upon the desert, how, it may be asked, do the elegant markings of the tiger, the jaguar, and the other large cats agree with this theory? We reply that these are generally cases of more or less special adaptation. The tiger is a jungle animal, and hides himself among tufts of grass or of bamboos, and in these positions the vertical stripes with which his body is adorned must so assimilate with the vertical stems of the bamboo, as to assist greatly in concealing him from his approaching prey. How remarkable it is that besides the lion and tiger, almost all the other large cats are arboreal in their habits, and almost all have ocellated or spotted skins, which must certainly tend to conceal them with a background of foliage; while the one exception, the puma, has an ashy brown uniform fur, and has the habit of clinging so closely to a limb of a tree while waiting for his prey to pass beneath as to be hardly distinguishable from the bark.

"Among birds, the ptarmigan, already mentioned, must be considered a remarkable case of special adaptation. Another is a South-American goatsucker (Caprimulgus rupestris) which rests in the bright sunshine on little bare rocky islets in the Upper Rio Negro, where its unusually light colours so closely resemble the rock and sand that it can scarcely be detected till trodden upon.

"The Duke of Argyll, in his "Reign of Law," has pointed out the admirable adaptation of the colours of the woodcock to its protection. The various browns and yellows and pale ash-colour that occur in fallen leaves are all reproduced in its plumage, so that when according to its habit it rests upon the ground under trees, it is almost impossible to detect it. In snipes the colours are modified so as to be

equally in harmony with the prevalent forms and colours of marshy vegetation.

Reptiles offer us many similar examples. The most arboreal lizards, the iguanas, are as green as the leaves they feed upon, and the slender whip-snakes are rendered almost invisible as they glide among the foliage by a similar colouration. How difficult it is sometimes to catch sight of the little green tree frogs sitting on the leaves of a small plant enclosed in a glass case in the Zoological Gardens; yet how much better concealed must they be among the fresh green damp foliage of a marshy forest. There is a North-American frog found on lichen-covered rocks and walls, which is so coloured as exactly to resemble them, and as long as it remains quiet would certainly escape detection. Some of the geckos which cling motionless on the trunks of trees in the tropics, are of such curiously marbled colours as to match exactly with the bark they rest upon.

"In every part of the tropics there are tree-snakes that twist among boughs and shrubs, or lie coiled up on the dense masses of foliage. These are of many distinct groups, and comprise both venomous and harmless genera; but almost all of them are of a beautiful green colour, sometimes more or less adorned with white or dusky bands and spots.

"Fishes present similar instances. Many flat fish, as for example the flounder and the skate, are exactly the colour of the gravel or sand on which they habitually rest. Among the marine flower gardens of an Eastern coral reef the fishes present every variety of gorgeous colour, while the river fish even of the tropics rarely if ever have gay or conspicuous markings.

"In the tropics there are thousands of species of insects which rest during the day clinging to the bark of dead or fallen trees; and the greater portion of these are delicately mottled with gray and brown tints, which though symmetrically disposed and infinitely varied, yet blend so completely with the usual colours of the bark, that at two or three feet distance they are quite undistinguishable. In some cases a species is known to frequent only one species of tree. This is the case with the common South American long-horned beetle (Onychocerus scorpio), which, Mr. Bates informs us, is found only on a rough-barked tree, called Tapiribá, on the Amazon. It is very abundant, but so exactly does it resemble the bark in colour and rugosity, and so closely does it cling to the branches, that until it moves it is absolutely invisible. An allied species (O. concentricus), is found only at Pará on a distinct species of tree, the bark of which it resembles with equal accuracy. Both these insects are abundant, and we may fairly conclude that the protection they derive from this strange concealment is at least one of the causes that enable the race to flourish.

"Many of the species of Cicindela or tiger beetle, will illustrate this mode of protection. Our common Cicindela campestris frequents grassy banks, and is of a beautiful green colour, while C. maritima which is found only on sandy seashores, is of a pale bronzy yellow, so as to be almost invisible.

"There are in the East small beetles of the family Buprestidiæ which generally rests on the midrib of a leaf, and the naturalist often hesitates before picking them off, so closely do they resemble pieces of bird's dung.

"A number of our small brown and speckled weevils at the approach of any object roll off the leaf they are sitting on, at the same time drawing in their legs and antennæ, which fit so perfectly into cavities for their reception that the insect becomes a mere oval brownish lump, which it is hopeless to look for among the similarly coloured little stones and earth pellets among which it lies motionless.

"The distribution of colour in butterflies and moths respectively is very instructive from this point of view. The former have all their brilliant colouring on the upper surface of all four wings, while the under surface is almost always soberly coloured, and often very dark and obscure. The moths on the contrary have generally their chief colour on the hind wings only, the upper wings being of dull, sombre, and often imitative tints, and these generally conceal the hind wings when the insects are in repose. This arrangement of the colours is therefore eminently protective, because the butterfly always rests with his wings raised so as to conceal the dangerous brilliancy of his upper surface."

The *Medical Mirror* publishes this month the first list of signatures to the petition to parliament, got up by the editor, praying that the registered practitioners in the kingdom may be directly represented in the Medical Council. The list is most respectable, and contains more than 300 names. The petition is about to be presented by Mr. Gladstone. The same journal denounces, in a vigourous article, the system of pluralism upheld by many of our hospital men, who, while endeavouring to crush special hospitals, are the real cause of their existence, through the greediness with which they grasp half-a-dozen offices at once. The third number of the new series of the *New York Medical Journal* is before us. The present issue contains articles by Drs. Hammond, Lombard, Lusk, Howe, and Hutchins.

Review.

ON LITHOTOMY. By WILLIAM FREDERIC TEEVAN, F.R.C.S., B.A., Surgeon to the West London Hospital, Surgeon to St Peter's Hospital, and Lecturer on Anatomy at the Westminster Hospital. London: Andrew T. Roberts.

THE little pamphlet is filled with original, and in our opinion, correct ideas on the subject of lithotomy. Mr. Teevan clearly demonstrates that the principle of dilatation of the prostate, commonly taught in our schools of medicine, is an impossibility, where there is an ordinary sized stone, and this he proves by the consideration of the anatomy of the parts, and also by the results of operations as shown by the preparations in the Museums of the different schools. We cannot do better than quote the practical conclusions to which the author has come by reasoning from these data:—

"1. That when lateral lithotomy is performed, the stone ought always to be cut out and not torn out.

"2. That the median operation is not justifiable for the extraction of calculi which are upwards of half an inch in diameter, for if such sized stones be removed by that process, obliteration of the orifices of the ejaculatory ducts and permanent impotence will ensue.

Lateral lithotomy in the boy is such a very successful operation, and if performed without laceration of parts, causes no injury to the seminal ducts, that no possible advantage can be gained by substituting the median operation for it, inasmuch as that procedure cannot often be accomplished in the child without lacerating the very parts we ought to avoid—the floor of the prostatic urethra.

"The only cases in which the median operation is eligible, is in those rare instances in the adult, in which there is a small stone, and in which lithotrity may not be considered admissible.

"I have now shown by examination of parts after lithotomy on the living, and by experiments on the dead subject, that no ordinary sized stone can be extracted through an ordinary sized prostate by means of the limited incision and so-called dilatation, without complete rupture of the prostate and its capsule, and frequent injury to the ducts, and other important parts. The surgeon is, therefore, reduced to the selection of one of the following methods of extracting the stone:—by tearing it out, or by cutting it out. I will show that the latter method is the preferable one. When a stone is extracted by a combination of cutting and dilatation (laceration), the surgeon does not know what mischief he may have caused, for when once he begins to tear, he cannot possibly tell where his rent will terminate. I have already stated that the laceration may extend into the rectum, far into the bladder, or destroy the seminal ducts. Now, although these injuries are very serious, they are not positively fatal, and, therefore, the deadly consequences resulting from the effects of laceration, are to be found in the extensive smashing of the plexus of veins round the prostate and neck of bladder. At all times a clean cut wound is preferable to a lacerated one, for not only is the latter attended with considerable local destruction of tissues, but it is more often followed by phlebitis and pyemia, than the other. Now the plexus of veins surrounding the prostate, cannot be smashed with impunity. If such be done, extensive suppuration may follow, and we are exposing the patient to all the chances of phlebitis and pyemia. In the adult, the veins often attain an enormous size, and any destruction of tissue must be at the expense of running a serious risk. An examination of the specimens in the museums teaches that, above all things, afrce oughtto be avoided; gentleness implies cutting; force loceration."

We strongly recommend the perusal of this little work to every surgeon. The subject is clearly and practically treated, and we consider that Mr. Teevan has turned over a new leaf in the annals of lithotomy.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 10, 1867.

LONDON COLLEGE OF SURGEONS ELECTION.

LAST week, just as this election was about to come off, we gave our final remarks on the subject. We have now to report that the party of progress has won a complete victory. The Fellows of the College have triumphantly vindicated their rights by placing three new men in the Council. Nor will the Profession, as a body, regret this result of the contest. This journal has frequently pointed out that the only hope of any of the Corporations being rendered serviceable to the Profession rests in a complete change in their Governing Bodies. So long as men of the old times, and of worn-out ideas, filled all the offices of influence, there could be no possible improvement in the condition of things. The Fellows of the London College have at length become awake to this fact, and have successfully carried out the first step in the much-needed Reform. There is one point in the recent contest that ought not to be lost sight of. Great fears were expressed that Mr. PRESCOTT HEWITT would not succeed because he refused to canvass. We must say it redounds much to the credit of the Fellows as a body, that they have placed him at the head of the Poll, and thus conclusively proved that no mere personal end was sought, but that they desired to establish a great principle. The three gentlemen elected were the next three in rotation. Mr. HOLDEN, who was brought forward as the Representative of the Fellows by Examination, was, although not elected, so widely supported that it is not unlikely a further attempt may be made to represent the examined Fellows on the Council. It may, indeed, be questioned, and, no doubt, will be by many, whether an invidious distinction of this kind should be set up, for every one knows well enough that the original Fellows had, at the time of the charter, already established their reputations, and a mere difference in age is the origin of the distinction between the two classes in the case at issue.

Mr. HOLDEN was an excellent man to put forward as a representative, since his popularity could not fail to insure him a large number of votes. Hereafter he will, no doubt, obtain a seat at the Council-table.

Messrs. SKEY, WORMALD, and KIERNAN retire with all the honours of their past career, and cannot but acquiesce in the decision that has been come to.

Messrs. PRESCOTT, HEWITT, SPENCER, SMITH, and BIRKETT now come forward to take their places as representatives of the reformers in the College, and their conduct will, of course, be eagerly watched by all interested. They have, we believe, made no public profession of faith, and their election is the result of a determination to effect some change. We trust now they will soon give some sign of the course they intend to pursue. The mere word "Reformers" will not be talisman of sufficient power to transform the College government into a liberal and enlightened system, nor will the mere presence of three new men abash the selfishness that has too long reigned supreme. The great body of the Fellows and Members of the College—nay, the whole Profession—look to the three new Councillors to deliver them from the tyranny under which they have too long groaned, and inaugurate an era of justice and right. Not that, happily, they will be alone in the conflict. There are already in the Council men who would gladly renovate the College, but who have too long been outvoted by the old party. Three new recruits to the weaker, though popular side, will equalize the contending forces, and enable the battle to be fought with more hope of success. We wait with interest the opening of the campaign.

UNIVERSITY OF LONDON.

ANOTHER candidate for the seat to be conferred upon this important constituency is announced in the person of Sir JOHN LUBBOCK, Bart., F.R.S. This distinguished scientific gentleman is not a Graduate of the University, although he is a Member of the Senate, and his father was one of the founders of this body. He is politically a thorough Liberal, and, there can be no doubt, would command extensive support from the Liberal Electors. He has always evinced considerable interest in Medical matters, and has recently accepted the post of Treasurer to the City Dispensary. We still retain the preference we have expressed for a Medical Graduate, but if one cannot be found, we could scarcely object to so eminent a Naturalist as Sir HN LUBBOCK.

DEASE *V.* WHISTLER.

THE circumstances disclosed in the case of DEASE *v.* WHISTLER, reported in our legal intelligence this day, when regarded as a sequel to late experience, justify us in declaring that the relation of Poor-law Medical Officers to their Board of Guardians, has become so unsatisfactory, that a serious question arises as to a remedy for a state of things which cannot fail to prejudice the efficiency of the Irish Medical Relief system. We do not derive this conclusion from this individual instance, for it is quite certain that the Bray Dispensary Committee has behaved in an exceptionally tyrannical manner towards its Medical Officer, but because, on a review of the late cholera emergency, of the manner in which it has been met by the whole body of Poor-law Medical Officers, and the acknowledgment of their services by Boards of Guardians generally throughout Ireland, we find, unfortunately, ample reason for our discontent. Whilst common consent declares, as we venture to assert it does, that the Medical Men of Ireland have done their duty with unflinching zeal, and in a humane and self-sacrificing spirit, which is thankfully recognised by all who entertain no interest or prejudice to the contrary, their public employers have shown—and we regret to record it—that they are influenced neither by gratitude towards their officers, nor respect for our Profession.

If Irish Poor-law Medical Officers had confined their labours, as they might have done, to the strict letter of their duty, they might have escaped with a tithe of the work and the danger which they did actually incur, and they could not have received fewer thanks, but they thought less of their private comfort or advantage, than of the appeal of the suffering poor. And what is the acknowledgment which they receive? We cannot call to mind one single instance in which a Board of Guardians has, of its own motion, honestly and liberally remunerated their Medical Officer in such proportion as the honest judgment of gentlemen might be expected to dictate, and we have recorded in our columns too many instances in which a miserable pittance, which those who gave it knew to be inadequate, was absolutely forced by process of law, from a niggardly conclave of Guardians.

It would have been a pleasure to us to be able to regard the proceedings of the Bray Dispensary Committee and Board of Guardians towards Dr. WHISTLER as peculiar to those assemblies. But as far as the evidence in DEASE *v.* WHISTLER goes, we do not find them more contemptibly little-minded than their fellow-guardians of the Dublin Unions. No thought of the necessity of guarding the public against the advent of cholera; no fair effort to meet the emergency by extra medical attendance; no sympathy with the fourteen hours' daily labour, prolonged into the night, which devolved upon their unfortunate Medical Officer; but the characteristic anxiety about the "after season," the paltry petty interests of lodging-house keepers and Mr. BRESLIN'S hotels, the miserable niggardliness of which puts pocket before justice.

Not one of our readers of ordinary acumen can fail to see that it was because Dr. WHISTLER protected his own professional character by contradicting a falsehood publicly circulated on his authority, without considering the calamity which his candour entailed of interfering with the arrangements of "Lady WALSH," Mr. BRESLIN, and the lodging-house keepers, that it was determined to stamp out a taste for truth and discretion which might prove dangerous on another occasion. We can acquit Mr. DEASE of anything but the hot-headed folly which rendered him ridiculous both in and out of court, and induced him to make a statement which was perfectly correctly characterised by Dr. WHISTLER as "totally without foundation," and which any man must perceive to be ruinous to Dr. WHISTLER'S character.

In the course of a most powerful, argumentative, and touching appeal to the jury, which, it is much to be regretted, has not been preserved, the following pathetic and truthful statement fell from the eloquent lips of Mr. DOWSE:—

> Gentlemen of the Jury—We all hear of the courage displayed by the general and the private on the field of battle—we hear of courage exhibited at the Redan, at Malakoff, and the taking of Sevastopol, when the ardent soldier, under the influence of wild excitement, rushes into action to win honour, distinction, and advancement, to be decorated with the medal, the clasp, and the cross of honour. But, gentlemen, I will tell you what true courage is; it is when the Physician, fatigued, harassed, and anxious, leaves the bosom of his family at the still hour of midnight, to visit alone in the wretched houses of the destitute, the half-starving and the suffering poor, a disease the most appaling that the human eye could rest upon—the collapse stage of cholera—to behold the parent, who is the entire support of a helpless family, lying in the firm grasp of death, to drive off which, human aid is ineffectual; the Doctor fearlessly exposes himself to the contagion of a disease which soon may lay him, also, on the bed of death; and he does this unseen by the public eye; no decoration is in store for him, and no record made of such heroic acts. This, gentlemen, I call true courage; and for this, how is my client rewarded. I read from his report-book that when he requested, on the 5th November, from his committee, relief of night duty, after having for thirty-five days attended the cholera and dispensary cases, night and day, stating "that fourteen hours daily is as much as can be fairly required of me, and more than I am quite able to go through, I have therefore to inform my committee of my present inability to do night duty," he is answered by a refusal, resign or go to the country, and pay for a substitute and starve. Is this, gentlemen, the way that an intelligent, educated, and over-worked Medical Officer is to be treated after eighteen years faithful service? We will use you as long as you can work, and then we will throw you aside as we would an old shoe. Nothing has struck me with such wonder throughout my life, as to witness men I have been acquainted with, educated, intelligent,

gentlemen by position and birth, becoming the Medical Officers of dispensaries, at the miserable salaries they receive, but whilst Mr. O'Reilly Dease, J. P., Dep.-Lieutenant, and Poor-law Guardian, deliberately proposes that no extra remuneration is to be given to Dr. Whistler, after more than three months attendance on such a disease as cholera, and that, because he received the munificent sum of £90 a-year, he should labour in this epidemic for no extra pay, or resign. Remember, gentlemen, from whose divine lips these words fell, "the labourer is worthy of his hire."

Probably the affluent Mr. DEASE little expected that a *mere* Dispensary Doctor—as rich and as poor as Dispensary Doctors usually are—would have met command to bow the knee with as spirited a refusal as it did, and the Profession ought to be thankful that it has been so, for at great personal annoyance and sacrifice, Dr. WHISTLER has asserted a right which Poor-law Medical Officers will not easily forget.

Let Medical men remember in future that, when a similar emergency arises, they can trust nothing to the good taste or liberality of Irish Boards of Guardians; let them remember that there is a Poor-law Commission placed above the contemptible self-interest of such coteries, who have shown their readiness to do justice, in some proportion to the merit of their labours—and let them learn from this flagrant attempt at bullying, that their is no influence in Guardians or Committee-men which ought or can hinder their Medical Officers from truthfully warning the public against great coming danger, or freeing their own characters from false aspersions, no matter from whom they come.

CEREBRO-SPINAL FEVER.

[COMMUNICATED.]

THE reports of cases which we publish, week after week, form collectively an impartial record of a great variety of methods of treating each of the numerous diseases which claim the attention of medical men, and, as a general rule, we abstain from expressing an opinion of the relative value of the several methods adopted. There may, however, be extraordinary occasions when it behoves us to deviate from the course which we deem it expedient usually to pursue; and we think that the outbreak and continuance in Ireland of the disease popularly known as "Black Death," and which we shall speak of as Cerebro-Spinal Fever, constitute one of these occasions. We proceed, therefore, to direct the attention of the Profession to some facts connected with this disease which, so far as we have been able to observe, do not seem to have received due consideration from those physicians in Ireland who have been called upon to treat it.

In the Memorandum relating to Cerebro-Spinal Fever, when epidemic in North Germany, addressed by the head of the Medical Department of the Privy Council to its President, April 19, 1865, he observed—"So far as results have yet been codified, medicine seems universally to have been powerless against the disease, and perhaps in some cases to have lessened the patient's chances of recovery. The officers who have just reported to the Prussian Government on the epidemic prevailing about Dantzig adverts (like many preceding writers) to the sudden collapse which often baffles all remedies. And evidently a disease which tends to that issue will not admit that generally depressing treatment be used against it, except (if at all) with the very utmost circumspection. It is on record that one French practitioner, who tried bleeding for the disease, lost thirty of his first thirty-one cases, while a second, using similar treatment, lost twenty-one out of twenty-two; and though other practitioners have alleged that in their hands this treatment has been of good effect, certainly it could not be admissible except under very close and careful qualifications with regard to the circumstances of its employment. Mercury has been freely tried, and seems to have been at least useless. Opium has been strongly recommended by some French practitioners, and perhaps, under some circumstances, has been of advantage."

This statement represents the conclusions of numerous observers—German, French, American, and English. Professor Hirsch, of Berlin, who undertook a thorough investigation of the disease, by order of the Prussian Government, and whose latest views concerning it are embodied in a comprehensive and elaborate monograph which he published last year, expresses a decisive opinion, which he fortifies by the testimonies of numerous authorities, that, in presence of this formidable disease, medicines of every kind prove alike powerless. We have carefully reviewed all the reports of treatment recently published in our columns, and have been struck by the fact that the therapeutical methods adopted have been scarcely less numerous, widely divergent, discordant, and fruitless than those which have been resorted to in the treatment of cholera. Here is an epitome of what has recently been tried by way of treatment of Cerebro-Spinal Fever in Dublin—mercury, carried in some cases to the extent of salivation, emetics, cathartics, opium, belladonna, digitalis, squills, prussic acid, chloroform, ether, Dover's powder, James's powder, chlorate of potash, carbonate of soda with lemon-juice, valerian, iodide of potassium, and cinchona bark, ammonia, wine, and brandy—all internally; enemeta of turpentine &c., were also freely administered; and besides these internal remedies, cupping, leeching, blisters, sinapisms, turpentine stupes, heat and friction to the limbs, and tartrate of antimony to the shaven scalp, were often prescribed.

Thoughtful men, on viewing such a formidable list as this, are not unlikely, as it seems to us, to echo the words of Mr. Simon—"Perhaps in some cases medicine has lessened the patient's chances of recovery," a phrase, the substance of which is also expressed more than once by Professor Hirsch. It is now generally admitted by the leading members of the Profession, that medicines avail nothing to recover patients from choleraic collapse. But although this conviction was arrived at by numerous observers in 1832, and was decisively established by the returns obtained by the Treatment Committee of the Medical Council appointed by the General Board of Health, of the treatment pursued in cases of collapse during the epidemic of 1854, the distressing practice of administering drugs during collapse is still, to a large extent, persisted in, so that thousands of cholera patients, while deriving no aid from them, not unfrequently suffer from their effects, especially if the struggle for life is prolonged into the stage of "reaction." Now, we appeal to the common sense of the Profession, and ask whether, in reference to Cerebro-Spinal Fever, a like melancholy and discreditable

history is to be enacted? Have we not data enough to enable us to settle once and for ever, whether or not medicines can exercise a remedial power in the treatment of this disease? If we have, surely the question presses urgently for an answer; and it behoves us not less surely, if that answer should be negative, at once to acquiesce in, and act upon it by ceasing to trouble the sufferers with drugs, which, though certain to do no good, are anything but certain of doing no harm.

After carefully considering the abundant evidence bearing on this point, and now readily accessible, we do not hesitate to affirm that according to our judgment this evidence amounts to irresistible proof, that in the treatment of Cerebro-Spinal Fever, drugs are useless, and that the chances of life of sufferers from the disease are, *cæteris paribus*, greatest in those cases in which none are given.

Now, if this conclusion—the conclusion, as we have said, of many distinguished writers who have recorded their experience in treating the disease—be correct, the question arises, are we then to stand by and do nothing, or does experience countenance any other procedure than those which we have enumerated above? It seems to us that this question is susceptible of both an affirmative and an encouraging reply. Mr. Simon, in his Memorandum, already mentioned, observes:—"In various processes of disease which resemble meningitis in their nature, the local application of cold judiciously and skilfully made, has given to modern medicine some very notable successes; and to it, more than to any known resource of the art, I should myself have been disposed to look hopefully in the present instance. . . . And Dr. Thudichum (who has seen something of meningitis on the Continent, and who has favoured me with a memorandum on the recent epidemics in Bromberg, Ottmachan), tells me that present experience in Germany is in favour of this principle of treatment." Dr. Burdon-Sanderson, in his excellent report "Of the Results of an Inquiry into the Epidemics of Cerebro-Spinal Meningitis, prevailing about the Lower Vistula, in the beginning of 1865," expresses himself as follows:—"I think that the complete concurrence of opinion among practitioners is sufficient to warrant the statement, that notwithstanding the generally negative results which are observed, leeching, and the application of ice-cold to the spinal cord, is the only mode of treatment by which the progress of the disease is likely to be arrested, and that its utility is confined to the first day, and, in some instances, to the first few hours after the patient has begun to vomit." But the most decisive and weighty evidence of the therapeutical value of ice is given by Professor Hirsch, in a passage quoted by Dr. Chapman, in his work on "Diarrhœa and Cholera," page 182, who, referring to the treatment of Cerebro-Spinal Fever by means of ice, has there summed up the facts and arguments in its favour. Professor Hirsch says—"The treatment of meningitis epidemica by the external and local use of cold, viz.—in the form of bladders of ice applied to the head and neck—has obtained a far more favourable judgment than bleedings of any kind, and generally it is found to be far superior to any other curative methods of an antiphlogistic character. Almost all observers who have adopted this plan declare themselves satisfied in the highest degree with the pain-assuaging, soothing, and simultaneously vivifying effects which the cold, thus applied, exerts on the undue sensorial activity of the patient; and even if it should be doubtful how much this treatment may assist in bringing the malady to a fortunate issue, yet, bearing in mind the complete harmlessness of the means when rationally used, an additional indication for the adoption of the same will be found in the eagerly-expressed wish of many patients for the continuous application of the cold, which, for some reason or other, it had been deemed right to interrupt. It has been proposed in some quarters to lay ice-bladders along the vertebral column. Wunderlich justly pronounces this procedure more troublesome than useful."

In face of these important statements, made in one case by the head of the Medical Department of her Majesty's Privy Council, and in another by the distinguished Physician appointed by the Prussian Government to enquire and report concerning the nature and treatment of the disease, we confess to some surprise in observing that, so far as we are aware, these authoritative recommendations have, with one exception, been wholly ignored or disregarded in the treatment of Cerebro-Spinal Fever in Ireland. In no instance, we believe, has ice been applied to the back of the neck, and in only one case (treated by Dr. Lyons) does there appear evidence that it has been applied to the head. We earnestly hope, however, that the extensive experience in the treatment of Cerebro-Spinal Fever in Germany, which has led to the conclusions we have now laid before our readers, will not be lost on those English and Irish Physicians who may be called upon to treat the disease, and that, if, unhappily, adequate opportunities should present themselves, the value of "the external and local use of cold" may be thoroughly tested and ascertained.

Notes on Current Topics.

Mr. Macilwain's Surgical Commentaries.—We commence with the present number a series of articles by the well-known author of the "Life of Abernethy," and "Medicine and Surgery one Inductive Science." The articles, when finished, will furnish a complete digest of Mr. Macilwain's principles and practice. As these have excited attention in America as well as in these islands, both from the boldness of their exponent, and the skill with which they have been advanced, we anticipate that this epitome, fresh from the pen of the veteran writer, and containing his latest views, will particularly interest our readers.

Harveian Oration.—This oration at the London College of Physicians was delivered by Dr. Alderson, the President, on Saturday the 29th ult. The memory of Harvey has thus been annually celebrated for more than 200 years. Until lately the oration was delivered in the Latin language, but, in accordance with the comparative neglect into which the cultivation of that tongue has fallen, the College has relaxed the rule, and for some years it has been given in English. Since the change the audience has greatly increased. Dr. Alderson took a wide view of his subject, maintained the philosophic character of medicine, and was quite equal to the expectations of his distinguished audience.

Dr. Livingstone.—Further news of this intrepid explorer's death has been published, consisting of another account of his fate, furnished by the same Moosa, whose former statements were so inconsistent and unsatisfactory. We are glad to observe that Sir Roderick Murchison, and

others, still maintain that we have no conclusive proof of the great medical missionary's death, and it is very fairly urged that Moosa, who was well-known for his untruthfulness, having given three conflicting accounts, is unworthy of credit as to either. So long as hope remains the search should be prosecuted. Livingstone's re-appearance safe and sound would be a gratification in all directions.

HIGHLAND SUPERSTITIONS.—According to the *Inverness Courier*, strange superstitions, leading to acts scarcely credible in this age, still reign in the Highlands. Our contemporary tells of live fowl being buried with the 'parings of an epileptic patient," and mentions, as well authenticated, a circumstance that occurred only a few years ago in a remote part of Morayshire, and that is calculated to excite feelings of disgust and indignation, being nothing less than the burning alive of an ox, in the hope of arresting an epidemic among cattle. It is well that such subjects should be investigated by journalists on the spot, for the sake of preventing a recurrence to such barbarous superstitions.

GUILTY BY BALLOT.—It is stated by the *Bucks* Herald that, at the quarter sessions, a man charged with stealing two trusses was actually tried by ballot. The enlightened British jury, to which the case was submitted, not being able to decide upon the evidence, according to the *Herald*, placed twelve slips of paper in a hat. Of these ten were blanks ; on one was written "guilty;" on another "not guilty." As the one indicating guilt was first drawn, the jury returned to court and gave a verdict of guilty. We should be glad to know whether these Buckinghamshire jurymen indulged in any solemn incantations before they submitted the guilt or innocence of the accused to the ordeal of the ballot.

THE STATE OF THE PROFESSION.—Dr. Edwin Lee, who has written several pamphlets on this subject, has petitioned Parliament to the following effect:—

"The humble petition of EDWIN LEE, M.D., a Member of the Royal College of Surgeons, and of several Foreign Medical Societies, to the Honourable Commons of Great Britain and Ireland in Parliament assembled—

"HUMBLY SHEWETH—That the Medical Profession in this country, being in a most unsatisfactory condition, which has for a long time past given rise to much agitation as well as distress within its pale, as also to reiterated debates in your Honourable House, without producing any materially beneficial results, your Petitioner, feeling convinced that the partial measure contemplated by an amendment of the Medical Act of 1858 would prove ineffectual in procuring an essential amelioration in the state of the Profession, or the removal of the abuses that continue to afflict the Medical body, humbly prays your Honourable House to take into serious consideration a subject so vitally concerning the well-being of the community ; and to devise such means as in its wisdom may seem fit, in order to the formation of an efficient system of Medical organization, and of legislative supervision, such as prevails in the other civilized countries of Europe.

"With a view to facilitate this object, your Petitioner, on his examination before the Parliamentary Medical Committee of 1848, as also on subsequent occasions, has sought, after comparing the Medical systems of organization of this country with those of the principal Continental States, to show in what respects reforms are most urgently required. He has embodied a recapitulation of the opinions entertained by himself, together with those that have been expressed by others who have given their attention to the subject, in an account of the state of the Medical Profession at the present time, so as to present what he conceives to be an impartial statement of the question.

"A copy of this pamphlet is respectfully offered to each member of your Honourable House, and your Petitioner will ever pray."

Legal Intelligence.

EXCHEQUER NISI PRIUS.

(Before the Chief Baron and a Special Jury.)

M. O'REILLY DEASE *v.* THOMAS L. WHISTLER, M.D.

THIS was an action to recover damages for an alleged libel written of the plaintiff by the defendant to the *Daily Express*, which was published in that newspaper. The plaintiff is an ex-officio member of the Rathdown Board of Guardians, and a member of the Bray Dispensary Committee. It appeared that the action arose out of proceedings at the Dispensary Committee and at the Board of Guardians concerning the defendant as medical officer. The committee recommended that £40 should be given to the defendant for his services during the cholera epidemic in Bray in the course of last autumn. A report containing that recommendation was sent forward to the Board of Guardians. In compliance with the request of the committee the plaintiff attended at the Board of Guardians on the subject. When the report came before the board he stated that the defendant had twice received the censure or had been censured by the dispensary committee. In reference to this it was that the defendant wrote the libel complained of. In this letter the defendant said his attention had been called to a report in the *Daily Express*, of proceedings at the board of guardians, at which Mr. Dease was reported to have said that he (Dr. Whistler), had been twice censured by his committee, and, "considering that such a statement was readily calculated, though, I trust, not intended to injure my character, I lost no time in placing myself officially in communication with Thomas Smyth, Esq., Hon. Sec. of the committee, so that I am in a position to state that Mr. Dease had no foundation whatever for advancing such an imputation." The letter was dated 7th February, 1867. The defendant pleaded several defences. He denied that he printed or published the letter ; he traversed the defamatory sense imputed ; and pleaded that the words complained of were not a libel. There was also a special defence setting forth a number of matters in connection with the positions of the parties at the dispensary committee, the circumstances under which the alleged libel was written, and justifying the writing and publishing for the reasons set forth in the defence, and averring that the plaintiff had no foundation for the statement that the defendant was twice censured by his committee. The plaintiff in his evidence stated that the committee were greatly displeased for writing to a newspaper a letter stating that cholera of a severe type prevailed in Bray, the more so as the committee considered the statement unfounded. They censured Dr. Whistler for that, and also on another occasion, for asking leave of absence at a time when he said cholera existed in Bray. The censure was not recorded in consequence of a motion by Mr. Wingfield Verner, M.P., seconded by him (Mr. Dease) not to do so. The committee were unwilling to give him any special payment in relation to the cholera, but voted the £40, being obliged by the Poor-law Commissioners to do so. The committee recorded that he (Mr. Dease) should attend before the Board, when the report came up, to make observations upon it. He did attend, and what he stated to the Board was perfectly true. Mr. Breslin was also examined in support of the plaintiff's case.

GEORGE HUDSON, Esq., J.P., was examined by Mr. Exham, Q.C.—I am a magistrate of the county Wicklow, and an *ex officio* guardian of the Rathdown Union Board,

and attended the dispensary committee last year during the prevalence of cholera. I was present when there was a discussion relative to cholera reports. A letter was produced from the *Bray Gazette* on that day after the business of the day was concluded. A division took place on the subject, in which I and others said that letter was calculated to give alarm to timid people, especially to ladies, and that I always understood that those afraid of cholera were more likely to take it, and that it was calculated to frighten the visitors, make them go away, and prevent others from coming, and be injurious, particularly to the hotels. I have no interest in the hotels, or directly in house property in Bray. Mr. Verner, M.P., proposed a vote of censure on Dr. Whistler, which the plaintiff seconded, but before it was put Mr. Jackson and I urged that it should not be put on the record, as it would be injurious to the defendant, and after Dr. Whistler had said he was sorry for it, and that it should not again occur, the matter was suffered to drop. The only other occasion I recollect was when Dr. Whistler applied to us that we should recommend to the guardians to allow him not to be called out to do night duty. The committee seemed greatly surprised at it, and I said in his presence that "I considered it surprising that, when the cholera was said to be raging, he should make such an application, and that when Dr. Leney, who was an older man, thought it his duty to attend to night duty, although not immediately connected with that particular district, it was not fair to put additional duty on him." I then said, "I could not conscientiously recommend the guardians to comply with his request."

Cross-examined by Mr. Dowse, Q.C.—I said the letter was calculated to injure the "after season" at Bray. My objection was that the letter was impolitic, not that it was untrue. Defendant made an explanation, and we were not satisfied. My recollection is that he stated he was fourteen hours per diem on duty, and that he felt unable, after such severe labours, to do night duty. I was not aware of a doctor being employed on night duty at Kingstown. I understood that, if he was unable to do the duty, he should have gone to the country, and employed another person during his absence. We did not give him what he asked.

To a Juror—I all through thought there was Asiatic cholera in the district, but I thought it was exaggerated.

The plaintiff's case closed.

Mr. Dowse, Q.C., stated the defendant's case, and characterized the libel as one of the mildest libels which ever was brought into a court of justice. Dr. Whistler is an eminent man in his profession, and against whose honour and good name not a breath has ever been raised. He has been for fourteen years resident in Bray, skilled in his profession, and holding degrees from the Colleges in which he has graduated. He receives the magnificent remuneration of £90 per annum for his salary as medical officer of the Bray dispensary. In September last the dread cholera appeared, and remained there until the middle of January, and the labour and fatigue of all that period fell on Dr. Whistler. The dispensary committee consisted of highly respectable men, and, among others, of the plaintiff, a well-meaning but fussy person. Why did not the plaintiff produce Dr. Leney? The books showed that from September to January he attended himself 132 cases of cholera, of whom 72 died, and 60 recovered. The people of that locality were anxious to conceal the fact of its existence there, and cry, "Peace, peace, when there was no peace." All the meetings of the committee during this period were attended by Dr. Whistler. He saw in the *Irish Times* of the 31st of October, a paragraph relative to cholera. "Tuesday night.—Medical Committee—At the meeting this day the medical officers reported that cholera had entirely abated in the township, and no fresh cases had appeared since the last report." Why there was no meeting, and no such report was read. Dr. Whistler on that very day had reported (and it was before the meeting on the 3rd November) that a fresh and severe outbreak of cholera had appeared. At this meeting Dr. Whistler was to be put under ban for telling the truth. Dr. Whistler, seeing that it was stated in the *Irish Times* that there was no fresh case of cholera, when he knew there was, and that there was a meeting, when there was no meeting, he sat down and wrote a letter to the *Irish Times*, stating that the letter of their correspondent was not true, as a large number of new cases of a malignant type had occurred since his last report; and honourable men will not condemn him for telling the truth. But the truth was not to be told, and the animus of the members of the committee is unmistakable. The letter was read, and a defendant said he had a right to write to any public journal. They have not the courage to say that this letter was untrue. He said: "As the committee don't like it, and as it might injure Bray, I won't for the future mind such reports, and I will not write again to the papers." There was no censure passed then, for his explanation stopped it, being deemed satisfactory. What on the next occasion? Worn out by his labours in attending on the poor, and brought into contact with disease and poverty, and combating with this malignant disease, which has baffled medical science, and with its terrible collapse, and brought out every night, Dr. Whistler, tortured with fourteen hours of labour for thirty-five days, found himself unable to cope with night duty, and, nervous and harassed he told them that he was worn out, and they told him he might resign or go to the country and recruit. They refused to give him leave, and the plaintiff has the coolness to inform you that because they refused to relieve him that is a censure! On the meeting of the 2nd February, 1867, the question of extra-remuneration came before them, and Mr. O'Reilly Dease moved that he get nothing. The Poor-law Commissioners and the Guardians on the Committee did not think so, and the committee voted him £40, and he politely bowed, and said he would not accept it. It was brought before the Board of Guardians, and the plantiff attended, but he had no right to libel my client as he did there. But a sealed order came down from the Commissioners, and he got £60. At this meeting the plantiff was there, and they disposed of Whistler's case in his absence. The resolution giving him £40 was read, and a letter from defendant was read, stating that the remuneration was inadequate. Mr. Dease said, "He unwillingly referred to the fact that Dr. Whistler had been twice censured by the committee, and that, therefore, the resolution of the committee should be agreed to without alteration." There was no censure. The plantiff is a passionate and injudicious man, and sometimes does things that he ought not to do, and this was one of them. This is one of the most baseless, senseless, paltry causes of action which was ever heard in a court of justice.

Dr. Whistler was examined by Mr. Palles, Q.C., and stated that he was an M.B. and B.A., of T.C.D., and a Fellow of the R.C.S.I., and had been in practice twenty-four or twenty-five years. First practised near Galway, and came eighteen years ago to Bray, on election out of 120 competitors to the Bray Dispensary, for the Bray and Rathmichael district. There are two medical officers attached to that particular district, viz., Dr. Leney, to Rathmichael, and I have Bray, the lion's share. The population of my district is 5000, including Little Bray, and having many of the poorest within it. I was appointed at £100 when I had less to do, and it was afterwards reduced to £90 when the Medical Charities Act came into operation. On the 6th October, 1866, it was resolved that, as some cholera cases were reported, the committee should meet every Tuesday, and should have power to appoint two additional medical officers, at salaries of not more than £3 per week, and additional nurses, and that medical appliances should be provided. I attended whenever blankets, nutriment, &c., were to be given out to the sick poor, and anything I, as medical officer, deemed necessary. The hours of attendance were from ten to eleven at the dispensary, and at my own residence from twelve; but in point of fact I arose at seven o'clock in the morning, and went every day of the week before nine o'clock to the dis-

pensary, and frequently to the houses of patients, before the dispensary opened. There was no cholera hospital in Bray, and none nearer than the workhouse hospital at Loughlinstown, three miles from Bray. There was a cart, that sometimes it was impossible to obtain for their conveyance. I never left before eleven o'clock, and often remained after eleven, and then remained at home for an hour to see if there were any other calls, and then went out to visit patients attacked with cholera and other diseases in their own homes. The cholera patients had a repugnance to go to hospital, and practically they did not go there. I never was free from attendance during the cholera time for four or five hours. I could not get back before three o'clock, having to make up the medicines myself, for there is no apothecary attached to the dispensary. I consider the type at the recent outbreak far more malignant than at the former. The cholera ceased on the 21st January, 1867, and the last case was a fatal one. There were in my district 125 cases of cholera, and seven non-dispensary cases, and 115 cases of diarrhœa. Of the 132 cases 75 died from cholera. 70 of the cases that died were dispensary cases, and one case of diarrhœa died. I was nine days ill—from 16th December to Christmas day—when I resumed duty. My attention was then called to the paragraph in the *Irish Times* of the 31st October, stating that the cholera had abated in the township. I had made no such report, nor had the other medical officers, who were my assistants, and could not do so. The township is exclusively in my district. I attended the meeting of the 3rd November, and found the committee assembled, and Mr. Jackson presided. When I went in an observation was made by Mr. Breslin respecting the letter I had written, which, he said, was calculated to injure the town and create alarm—that he had received intimations from Lady Walsh, and ladies of distinction, and that when my letter was read he had no doubt these people would decline to come to Bray. Mr. Hudson said, "there was an end to the after season of Bray." Mr. Jackson said, "the town would be emptied." I said nothing. When there was a pause, I said I considered I had a perfect right, as a medical officer of the district, to contradict so great a falsehood, as it was published with the sanction of my authority, and as I had previously drawn up a report stating that cholera had re-appeared; and I considered the denial of the statement in my report attributed falsehood to me, and that was my only object in taking notice of such a mis-statement; that it was not my interest to injure Bray in any way; that while I considered that the committee had no right or jurisdiction to prevent my writing, I was ready and willing to say that for the future I would take no notice of such reports; and that, although several such reports had appeared before in that paper, but not purporting to be with my sanction, I, therefore, took no notice of them, and I would not take any more notice of them. Mr. Verner said "that he considered the statement of Dr. Whistler so straightforward and gentlemanly that we should take no further notice of it, and the matter should drop." That was assented to by the committee, and there was not a single word or resolution whatever of censure or otherwise mentioned. After that statement they all seemed perfectly satisfied with what I had stated. No censure directly or indirectly, was conveyed. No one cautioned me to write no more. They appeared all perfectly satisfied with my assurance, and there was no more about it. My next report was the 5th Nov., asking for leave of absence, on account of laborious duty. [Read.] That report was true, and I was suffering severely from intense anxiety, from overwork, and from the wretched and deplorable scenes of misery I had witnessed. My health, bodily and mental, was injured, and I attribute my subsequent illness in December to over-work. No one but a medical man knows the anxiety and labour of attending cholera patients, who must be seen repeatedly. In consequence of its being covertly stated behind my back that I had exaggerated, I prepared the nominal return of names, ages, duration of illness, residences, and results, &c. The permission was refused. There was no censure whatever. Mr. Hudson stated he never heard of so monstrous a proposition, and I was very uncourteously refused exemption from night duty. I did not miss a meeting, or omit to attend the meetings, up to the 13th of November. It is not part of my duty, as a medical officer, to attend those meetings. I was not present at the meeting of the 13th Nov., for I went at nine in the morning to the dispensary, and was there occupied till a quarter-past eleven, and with patients outside until a quarter-past two P.M., and would have had to neglect serious medical duty if I had attended the meeting of committee, which took place at one. I felt so exhausted from want of food and toil that I went home, thinking that the committee meeting was over. No censure on my conduct was ever, directly or indirectly, conveyed to me. The ordinary meaning of the words, "So that I am now in a position to state that Mr. Dease had no foundation whatever for advancing such an imputation," is that he laboured under a serious mistake when he made such a statement; and that was the meaning I attached to it in a letter which I subsequently wrote to Mr. Dease. I met him in the street, and Mr. Jackson said I was foolish to take notice of the letter, as no one in Bray minded what Mr. Dease said or did. I said I was on my defence, and I had to defend myself against such an imputation, and that I was ready to do anything consistent with the preservation of my character.

Cross-examined by Mr. EXHAM, Q.C.—I explained to Mr. Jackson that I could not withdraw that letter. I left the house with the impression that the matter might yet be arranged. Dr. Leney, I think, was there, but we did not compare notes. There was no one there that day (30th October) that I did not personally know. Dr. Leney had nothing to say to some portion of the township at that time. Dr. Leney's report on the 29th is that there were no fresh cases of cholera in his district. The districts are quite distinct. I was not aware of his return at the time I wrote.

At the close of the defendant's evidence, the jury stated that they had made up their minds, and were prepared to give a verdict.

Mr. PALLES, Q.C., on behalf of the defendant, said that, after that intimation, he would not examine Sir George Hodson or any of the other witnesses in attendance, nor would he himself think it necessary to address the jury.

Mr. EXHAM, Q.C., then addressed the jury on behalf of the plaintiff, and stated that if Dr. Whistler had merely conveyed by his letter that Mr. Dease had committed no more than a mistake, or if he had filed a plea denying that the letter was a libel, and that he imputed nothing more than a mistake to Mr. Dease, the jury would never have heard of the trial, but instead of that he filed a plea of justification, in which he imputed to Mr. Dease deliberate falsehood made in bad faith to injure him. Counsel most strongly insisted that if the jury found the letter a libel upon the interpretation put upon it in the summons and plaint, they must find for the plaintiff, for no jury could venture to hold that a plea of justification had been proved in the face of Dr. Whistler's own statement, that he did not believe Mr. Dease capable of stating what was false, or that he would do so for the purpose of injuring him. If they found that the letter was no libel, then, though they found for the defendant on that question, still there should be a finding for the plaintiff on the plea of justification. With regard to Mr. Dease's statement that Dr. Whistler had been censured by the committee, that statement had been confirmed by the witnesses examined in support of the plaintiff's case, although he (Mr. Exham) would agree with the jury in disapproving of the conduct of the committee towards Dr. Whistler; but that was not the question they were trying.

His LORDSHIP charged the jury. In the course of his observations, his lordship said it was gratifying to know that, whatever way the verdict should go, both gentlemen would leave the court without the slightest imputation on either of their characters.

The jury found that the letter was not a libel, and that it did not bear the construction imputed in the summons and plaint. They also found that the defendant was not censured at all by the dispensary committee. They found for the defendant, with sixpence costs.

His Lordship then stated that he hoped, at the conclusion of the case, that his opinion in the following matters might in some way be conveyed to the Poor-law Commissioners. His opinion was, that he perfectly agreed with what had been stated by counsel at both sides in the progress of the case, as to the inadequate remuneration of Medical Officers, and read from his notes the following testimony, given by the defendant during the course of the examination relative to the state of his health at the time he sought for leave of absence from night duty:—"My health at that time was invaded. I most unquestionably attributed my subsequent illness to over-work. No one knows the labour and anxiety of attending cholera patients. They are not cases in which you may attend one day and go again on the morrow. The patient may die in a few hours, and must be seen repeatedly."

Counsel for the plaintiff—Mr. Sergeant Armstrong, Mr. Exham, Q.C.; and Mr. Dames. Attorneys—Messrs. Meade and Collis. For the defendant—Mr. Dowse, Q.C.; Mr. Palles, Q.C.; and Mr. Wilson. Attorney—Mr. William Fry.

ROLLS COURT, DUBLIN.

Carmichael's Trusts *ex-parte* the President and Secretary of the Royal College of Surgeons.

Mr. Lawson, Q.C., applied on behalf of the above officials for instruction under the advice of the court as to the trusts of the will of the late Surgeon Richard Carmichael. The testator had, in a document called "The Sequel," set out the trusts of a £3000 which he devised to trustees to pay over to the applicants. The latter were directed every fourth year out of the accumulations of the income derivable from the said principal sum to offer two prizes of £200 and £100 respectively for the first and second best essays on subjects therein enumerated, and calculated to benefit the medical profession. Directions were also given as to the advertisements beforehand, and the Council had the power, if the essays were not of sufficient merit, on any occasion to withhold the premiums, and give double prizes on the next contest if the essays should be worthy of such addition. The essays were to be read at stated times, printed, and so many distributed gratuitously before sale of the rest; and the testator then provided that if the Council should neglect thus to deal with the interest of the fund that the accumulations of interest should be given to the Medical Benevolent Fund, and that his trustees, when handing over the fund to the Council, should see that this was legally provided for. In 1855 and 1858 they advertised for essays, and they have again done so this year. The essays sent in in 1856 and 1859 were not deemed worthy of any prize, nor was a double prize offered on occasions after the first. In 1865 Dr. Churchill and Dr. M'Clintock, the Secretaries of the Medical Benevolent Fund, applied for the accumulated interest, which the Council were willing to pay to them, but they were advised to come before the court on the questions of construction of the clauses of the will.

SECOND DAY.

Mr. F. W. Walsh, Q.C., appeared on behalf of the Medical Benevolent Fund respecting the above petition, which had been partly heard on the previous day.

His Honour said he had since considered the matter, and it seemed to him that the Council of the College of Surgeons had not carried out the intention of the testator, beyond merely advertising for essays.

Mr. Walsh—And reading them when sent in.

His Honour—The testator, however, had intended and directed, that if the rewards of £200 and £100 were found to be not sufficient at the first, no rewards should be then given, but these rewards might be doubled the next time to encourage competition, for which purpose the interest should be accumulated for the eight years. It had so happened, that at this second trial, the merit was again insufficient, and so no premiums had been awarded. The result of all this was, that there had been a total failure of the objects of the bequest. On the whole, he was of opinion, the best way would be to act on the authority of Belvidere's Trusts (2 Ir. Eq. Reports, 354), and refer it to the Master to settle a scheme for the administration of the fund.

Mr. Walsh asked would his Honour think it right to direct the council to offer double rewards?

His Honour said he would be very slow to do that.

Mr. Walsh then asked that so far as the interest was accumulated it should go to the Medical Benevolent Fund.

His Honour was not satisfied that the case warranted such an order, for the bequest over was in case the council should "neglect to comply" with the rules laid down. He yesterday had expressed a doubt if there had been any such "neglect."

Mr. Edward F. Litton, for the council, said Mr. Walsh's rights, as to the accumulations of interest, would not be prejudiced by standing over till the Master had made his report.

Mr. Walsh contended that the council were bound to distribute the interest at the end of four years, and, failing that, at the end of eight years, but at no other time. They had not done so, and, therefore, the Medical Benevolent Fund had acquired a right to the accumulation, and accordingly the scheme of the Master should be directed to refer only to the future interest of the fund.

His Honour said the council had already gone to much expense in advertising, &c., and which the Master should be able to reimburse them, as such would fall within the *cy pres* scheme. All that could be done now as to the past interest would be to have a sum paid on account to the Medical Benevolent Fund, and that would be useless.

Mr. Walsh still pressed for a declaration that the Medical Benevolent Fund was entitled to the accumulated interest.

His Honour, however, said that he would direct a reference to the Master to ascertain a scheme for the future administration of the fund, which direction of reference would preclude any dealings with the past accumulations. When the report should come back, one order could be then made, including every portion of the funds in question. The Medical Benevolent Fund should have liberty to attend in the office, and the cost should stand over till the final order was made.

EPIDEMIOLOGICAL SOCIETY OF LONDON.

July 1st.

Dr. Jenner, F.R.S., President, in the chair.

At a more than usually full meeting, three papers concerning the terrible disease now exciting so much interest in Dublin, were read, and subsequently the nature of the malady gave rise to a lively and interesting discussion, which, however, did not seem to throw any fresh light on the subject.

The first paper was read by Dr. Marston of the Army Medical Department. He gave an account of twenty-five persons who had been attacked with the disease; of these, nineteen were soldiers, two women, and four children. A considerable number of the soldiers were young. The cases were very briefly reported, but a few careful details of them being given, a point of considerable interest was noted in more than one case, viz.—that the urine was generally of light colour, non-albuminous, and of specific gravity—about 1010. No cause for the sporadic origin of the disease was assigned, but it was ascribed to an "epidemic constitution." Dr. Marston said that the Dublin butchers have found their pigs affected with a like disease, which killed forty of them belonging to one man. The idea that the disease is contagious, seems to be discredited by the fact, that the soldiers of the flying column were in an especial degree its victims. The symptoms were remarkable for their number and variety, but appear to be chiefly due to two proximate causes—a blood-poison, and in-

flammation of the cerebro-spinal nervous centres. The spinal seemed to predominate over the cerebral symptoms. The number and extent of the purple spots presented no obvious relation to the degree of intensity of the cerebro-spinal inflammation observable. The perspiration was acid.

The second paper was communicated by Dr. Mapother, of Dublin, and as he was not present, it was read by Dr. Milroy. The following is a brief abstract :—

MALIGNANT PURPLE FEVER.

The author, who had made the communication at the request of the Society, first detailed the history of the outbreak from March 18, 1866, to the present date, and stated that sixty-three cases had been recorded in the Dublin district, and about thirteen over the rest of Ireland, as it had appeared in Tullamore, Birr, Mitchelstown, Rathcoole, and Clondalkin. The topography of the disease was illustrated by maps. In Dublin the greatest mortality, namely fifteen, had occurred in April. In Chelsea the disease had distroyed one life. As "febris scorbutica" the malady had probably been known for centuries. If it be determined that the disease be essentially a lesion of the vaso-motor and cerebro-spinal systems, Dr Mapother suggested the term "neuro-purpuric fever." He described two types, the more grave being a blood-poisoning or toxæmic lesion of the vaso-motor system, the milder being scarcely different from sporadic cerebro-spinal arachnitis. The first was indicated by chilliness, vomiting (owing to stimulation of the vagus nerve), constipation, but in one case melœna had been seen by him, and especially purple blotches of dissolved hœmatin in and under the skin, averaging in size that of a pea.

Thermometric observations had shown that the heat of the surface differed slightly from that of health. He detailed one case, in which a healthy woman, aged fifty-nine, had sunk last Thursday in twenty hours. Prostration and extensive appearance of blotches, with some stupor, was early perceived. In this case there was the dietic peculiarity that she would never eat vegetables. In these sudden cases congestion of the cerebro-spinal membranes and lungs, with tarry blood, was the only *post-mortem* condition. To illustrate the second form of the disease, a case from the report of the surgeon of the 52nd regiment was quoted, in which the symptoms and morbid appearances were those of inflammation of the cerebro-spinal membranes. Death occurred on the 15th day. Violent cerebro-spinal pain, increased sensitiveness and tetanoid contractions, in some cases greater than that of tetanus had characterized other cases. Paralysis, defective nutrition, and low inflammations in the eye tunics, almost exclusively the right, had been frequent during recovery.

In such cases the cerebro-spinal membranes had shown every trace of inflammatory action. The most rapidly fatal case of the first form had destroyed life in four hours and three quarters, from perfect health, but in forty-one cases the average duration was forty-two hours. The mortality had exceeded 50 per cent. Of 41 investigated cases 6, 6, 6, and 8 had occurred in the quinquennial periods from 5 to 20, which proneness the dominant action of the sympathetic, and the abundance of fibrin from the removal of temporary organs, would explain. 21 of the deaths were in females ; 20 in males. No rank of life was exempt, and the only cases in which contagiousness could be believed in were two, in which the sanitary circumstances were of the worst kind. The promoting causes of purple fever and cholera are presumably similar, for all the towns in which the former had appeared had suffered last year from cholera. If the morbid poison of purple fever was that of typhus, the lesser contagiousness would be due to the rapid death, for it is during the eliminative stages that the latter most readily spreads. Mental disquietude, such as wakefulness—that among the troops who pursued the Fenian rebels, the regrets of recruits and the anxiety of soldiers in American war, appeared to have been exciting causes. The unparalleled coldness and prevailing east wind of March, April, and May, promoted the disease. Fever had been notably less, but measles was most prevalent and fatal.

For the past eighteen months "purples" had been most fatal to pigs, and Dr. Mapother detailed many of the phenomena of the epidemic, to show its analogy to the human malady. It had been prevalent in 1846, when the former attack of cerebro-spinal disease was present. Having alluded to other zymotic diseases, now rife, he expressed regret that there were no facilities for the study of epizootics. Previous epidemics of cerebro-spinal arachnitis were then contrasted ; those in 1839 in French garrisons, in the Dublin Workhouse, in 1846, and in Dantzic in 1865, being shown to be purely cerebro-spinal, whereas, the outbreaks in the United States were, just as in the present Irish disease, of two forms, malignant purpuric, and cerebro-spinal. With regard to the nature of the disease, Dr. Mapother urged that all phenomena of the rapid blood-poisoning form might be explained by depression, or arrest of the functions of the vaso-motor nerves, which especially abound in and under the arachnoid, and the superior activity of this system in children, might explain their great proclivity. That want of vegetable food, the cause of scurvy, may be a main promoting cause of this disease, would appear from its occurrence during the potato famine ; and now, when that most anti-scorbutic food and green vegetables were so high-priced, that the poor fed on bread and Indian meal principally. Purpura and scurvy were more frequent now than for many years. The spring and early summer months were the prevailing periods of the present and former epidemics, and then the potato was scarce and bad. The rich were occasionally victims to the disease, but among them the habit of abstaining from fresh vegetables was not infrequent. Typhus implanted upon a scorbutic person would kill at once, and Dr. Mapother thought that the appearance of purple blotches in the present, and not in the epidemics of meningitis in other countries, may be due to dietic peculiarities. Petechiæ are far more frequent in typhus in Ireland than elsewhere.

To aid recovery, vaso-motor stimulants, such as ergot, belladonna, or cantharides, were worth trial, as were also stimulants and digestible nutrients, like solution of beef in dilute hydrochloric acid.

Although he regarded the disease as slightly, if at all, communicable, he had directed disinfection and isolation; but if the dietic point he had touched on were proven by his further investigations, the disease would be one of the most preventible which we encounter.

The following is a short summary of the third paper, which was read by Dr. Lyons :—

ON THE RECENT OUTBREAK OF "FEBRIS NIGRA" IN DUBLIN.

The author communicated the notes of several cases, and exhibited specimens of the spinal cord from two cases. He proposed to designate the disease "*Febris Nigra*." He believed that the malady is allied to yellow fever, cholera, and in a certain sense to typhus, and to other diseases in which, without necessary physical lesion or profound prostrating effect, is exercised on the nervous centres, and through these on the blood. As to the causation of the disease, he referred to the general sanitary state of Dublin, which he described as bad as bad can be. When cases of this disease occurred in 1866, Dr. Lyons called the attention of the Lord-Lieutenant and local authorities to them as an indication of a marked change in the epidemic constitution, and predicted an epidemic possibly of cholera, which came in due time. This year he made a similar prediction, and he remarked that at least one case of cholera had already occurred in Dublin.

Dr. CRISP, referring to his patient, who, as reported in the *Lancet*, died at Chelsea, June 17, said he was quite pulseless; that there was hardness of the cervical muscles, and subsultus tendinum, but that the most distressing symptom was extreme pain in the legs about the hams. He stated that when pigs eat the viscera of animals which have died of splenic apoplexy, they die of cerebro-spinal meningitis. He expressed the opinion that the disintegration of the blood, said to have occurred in his patient, and in those dying in Ireland, "is caused by some electric influence."

Mr. RADCLIFFE stated that a child attacked with the disease died at Bethnal Green, within five hours of seizure, on the 27th ult.

Dr. BURDON SANDERSON characterised Dr. Mapother's theory, that the two types of the disease are due to two distinct proximate causes, as a most improbable solution. He also expressed his opinion that the post-mortem examinations had been too few, and too inadequately made, to establish the identity of the disease in Ireland with the epidemic recently prevalent in the North of Europe.

Dr. MARSTON contraverted the suggestion which had been made by Dr. Mapother, of a connection between scurvy and this disease. The question was, however, not to be lost sight of. It seems also to be markedly differentiated from typhus, in respect both to its etiology and its extreme destructiveness.

Dr. CAMPS entirely concurred in the opinion of the last speaker, and thought all the symptoms were referrible to the nervous system.

Dr. STEWART was struck by the fact that a large number of the better class were attacked both in Ireland and in America

and observed that all the earliest cases in America were of persons exposed to hardships, as campaigners. He discredited the notion that there is any essential relation between the disease in question and scurvy or typhus. There is never the true typhus eruption. During the last two years he had observed the occurrence of spots in various diseases, especially in cases of articular rheumatism. During six or eight months in 1858, there were cases of this kind in Middlesex Hospital, which were then called erythema-rheumatica.

Dr. YANDELL, an American physician, stated that ten years ago the deer which abounded in the Southern States were almost wholly destroyed by a disease called "the black tongue;" that recently the pigs have been carried off in such numbers as to have contributed greatly to the famine which has prevailed in the Southern States, by a disease called "hog cholera," or "blind staggers." Sometimes it was associated with diarrhœa, sometimes not. The common domestic fowls, turkeys, and ducks, were affected in the same way.

Dr. BOWEN reported the summary of information obtained by him from conversing with three Dublin physicians, who, besides stating their impressions of the nature of the disease, said that a large number of persons are affected with minor attacks, just as during a cholera epidemic many who do not suffer from vomiting or diarrhœa experience disorders, seemingly, of the nervous system. Dr. Bowen also mentioned a report that at the present time a similar disease is proving extremely destructive among the Arabs in the Valley of the Euphrates.

The President, Dr. JENNER, adverted to the obviously great distinction between cerebro-spinal meningitis and typhus. The latter attacks children very rarely, and infinitely more rarely kills them. Moreover, in cases of typhus he never saw a trace of lymph, or pus, at the base of the brain. Certain cases, small-pox and scarlet fever, kill in a few hours; when they do so they are characterised by ecchymoses and effusions, having some resemblance to those of the Dublin cases above described; and in some cases of small-pox there is inflammation of the eye-ball, a feature characteristic of the disease now known by so many names, none of which he said are good.

Correspondence.

PREVENTION OF VENEREAL DISEASE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In reading a letter which appeared in last week's MEDICAL PRESS AND CIRCULAR, signed "E. L.," on prevention of venereal disease, one cannot help being struck with the novelty of the idea of examining men as well as women, with the view of reducing venereal diseases. Theoretically speaking, the idea is good, and it does certainly strike at the root of the evil, but it could never be carried out, for many reasons. In the first place there are 1332 brothels known to the police, besides 516 public-houses and coffee-houses used for immoral purposes, and the prohibition of their use only during certain hours would never be adhered to. Fancy a Surgeon attached to each house to examine men frequenting it from four o'clock in the afternoon until midnight! That proposition could never be carried out, for where could one find 1848 medical men for such a purpose, and how could they be paid? If men are to be examined at all, it cannot be by surgeons appointed to every house, but by certain parties, and who those certain parties are the reader of this letter cannot require telling. Unfortunate girls have themselves to look out for, and they ought to exercise some little caution against infection whilst carrying on their wretched calling. At the same time the public want protection from certain abandoned women, who, having no remnant of any good feeling left, wilfully and wantonly spread disease amongst the opposite sex day after day and night after night. "E. L." says that submitting girls to police regulations is degrading. I quite agree with him there, for I think to force any woman who may be suspected of being a courtesan by the police to compulsory inspection is very bad and very unjust. If such a law were to come into force, it would be hardly safe for any young woman to walk in the streets alone, for she would be liable to be addressed and apprehended by any policeman who might take into his head that she was no better than she ought to be. To put unfortunates under police surveillance is quite out of the question. In England it would never do to thus infringe on the liberty of the subject, though the object in view might be the prevention of venereal disease. But I think that for the mutual benefit of all parties no unfortunate should object to medical inspection, which might be done in the following manner:—Inspecting surgeons might be appointed by Government, and towns divided into districts, and then all brothels within such districts should be licensed, and the inmates examined twice a week by the Inspecting Surgeon, who would give a clean bill of health in all cases when possible, or report disease to the proper authorities, and refuse to give a certificate of such a woman being free from disease. Of course, these inspecting surgeons being well-known, many a girl, who, without being a regular well-known street-walker, yet follows the same calling on the sly, living in private apartments, would avail herself of getting examined, and reported free from disease, for the sole purpose of showing her *friend* her clean bill of health. If all courtesans were known to be regularly examined, and a clean bill of health given when it could be done, you may depend upon it that every *roué* would avail himself of it, and require to see the date of the last inspection, which, if a girl refused to show, he would instantly suspect something wrong with her, and, on the other hand, if he did not require or care about seeing her bill of health, she might suspect that all was not right with him.

For further protection, any woman found guilty of altering the date, or otherwise tampering with her bill of health, should be subject to any penalty, fine, or punishment, as the law might direct.

Under the above regulations, there is very little compulsion, those women only being compelled to be examined who live in licensed houses. I feel assured that the idea of licensing houses for immoral purposes, and certifying to the cleanliness, or, rather, freedom from disease, of individual persons, will meet with opposition from every quarter, especially amongst the ultra religious circles, but be it remembered and borne in mind, that it is for the welfare of the body, and not for the good of the soul, that the Venereal Committee of the Harveian Society are urging upon Government the necessity of medically inspecting regular prostitutes, with a view to the prevention of venereal disease. Medical inspection, carried out as suggested above, must tend materially to diminish venereal disease in every shape, and amongst all classes of society, without infringing upon the liberty of the subject, or yet submitting unfortunates to what would be most repugnant to the feelings of every Englishman or woman, "the immediate surveillance of the police. In Continental hospitals, it may be argued, that as bad cases as possibly can be of syphilis are to be met with, so it is ever likely to be. The Venereal Committee do not think they are going to eradicate venereal disease *in toto*, but only by proper caution it is thought that its spread might be arrested, and in time the disease itself considerably lessened, and they have every encouragement, for Dr. A. Vintras has proved that venereal disease amongst registered women in Paris is only 1 in 196, whilst among clandestine women who escape all supervision, it is one in seven. And then, again, in New York, where no registration exists, it is even worse, being one in three. The number of cases admitted into the Lock, the Metropolitan, and Provincial Hospitals, shows that syphilis, &c., is no uncommon thing, and the sooner Government exercises some stringent measures to reduce its spread the better, however shocking it may appear to some fastidious persons the plan of registering women for immoral purposes, and inspecting them for the sake of the public health.

Should this letter meet the eyes of any person or persons in power, and could any hint be taken from it, or any good result follow, it will have more than answered the utmost expectations of your obedient servant,

HENRY W. WILLIAMS, M.D.

Guilsborough, 2nd July, 1867.

THE SPAS OF LISDOONVARNA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Having just returned from the Spas at Lisdoonvarna, it occurs to me that a few hints as to the best means of reaching them, and as to the accommodation which a patient may expect upon arriving in their vicinity, may not be uninteresting to your readers, nor destitute of utility in enabling them to afford some very necessary advice to their patients.

Lisdoonvarna is a place worthy of the attention of the profession. It is situated at a little more than twenty miles from Ennis, in the County of Clare. It is on a lofty table land,

traversed in various directions by small streams, which struggle along the bottoms of deep ravines, that sometimes constitute miniature dargles, although I cannot say that beautiful scenery is an ordinary characteristic of the district. The air is pure and bracing, impressing one with a sense of salubrity.

The spas of Lisdoonvarna have been long known to the peasantry of the surrounding counties, who tell wonderful tales of the surprising cures effected by their use, and we met here several hawkers, who make this neighbourhood a part of their route every season, although from the scantiness of the population, their profits must be very small; and one woman told us that she was in the habit of coming here every summer for the last thirteen years. The gentry and the Profession have only learned the value of these spas during the last few years. Some account of them was given in "Knox's Irish Watering Places," and Professor Apjohn has published an excellent analyses of the waters of the different springs, to which I must refer for minute particulars.

The springs may be divided into the sulphureous and the chalybeate. So far they resemble the Spas at Harrogate, but in many important matters they differ from them. Thus the sulphureous waters at Lisdoonvarna tend to produce constipation, and it is necessary that the users should bring with them some ordinary aperient medicines, such as the so-called antibilious pills, or seidlitz powders, to obviate this effect. They are alcaline and mild, and do not produce, either externally or internally, those stimulating consequences, apt to follow the employment of other sulphureous waters. The chalybeate waters contain much more iron than the Harrogate, and there is one especially which is commonly called the magnesian spa, which, from the peculiar combination of its constituents, happens to be unusually agreeable and effective.

As these spas are likely to attract an increasing interest on the part of the profession and the public, it is desirable that the physician who prescribes them should be in a position to explain to his patients the itinerary he would have them to pursue, as well the hopes of accommodation which they may entertain upon their arrival.

As far as Ennis the route is all plain sailing (you may perceive I am becoming nautical—fresh from the cliffs of Mohr, and the view of Achill Islands). The best train to Limerick is the mail, which at present starts from King's Bridge at twenty-five minutes to nine A.M., and arrives about twenty minutes after one P.M. The corresponding train to Ennis leaves Limerick at a quarter past two, and reaches Ennis at 3·35. These arrangements are of course liable to change next month.

But having arrived in Ennis, the question arises—how to proceed further? For strong healthy persons there is a long outside car-like Bianconis, and perhaps instituted by that enterprising individual to whom Irish tourists are so much indebted; but strong healthy persons have little or no business at Lisdoonvarna, and a drive of more than twenty miles over a somewhat roughish road, and through a very bleak and uninteresting country, would not be exactly the way to raise the spirits, or strengthen the hopes, of a feeble, desponding invalid. My advice to such would be to hire a carriage—the cost is about twenty-five shillings, a shilling a mile, and threepence to the coachman. But it is necessary to order the carriage the day before, for the number in Ennis is limited, and they are very much employed, either for weddings, or for funerals, or the assizes, or Lisdoonvarna itself (I have heard all these assigned); and to have to stop a night at Ennis is the delay of a day, and a disappointment. The carriage may be secured, however, by a letter or telegram to Carmody's or Curtin's hotel.

I have said the country is very bleak and uninteresting. For the first half of the way to Lisdoonvarna you have on either side of the road enormous crops of limestone, rarely rising more than three or four feet above the level of the soil, flattened at top, and traversed by fractures pointing out a rhomboidal structure, similar to the cleavage so usual in calcareous spar. The loose stones are collected into open-work walls, and a few sheep and goats graze on the spots of greenery between the rocks. There are the ruins of a mansion or castle, belonging to the O'Briens, called, as well as I could make out from a countryman, "Nervane Castle," on the road side. This castle, having three gables and a square high tower at one side, pierced with holes for musketry, and two rows of windows in the mansion house part, belongs, I think, to the time of James I. A ruined church also on the right, might, amidst this barrenness, excite curiosity, and one might perceive through the apertures, once windows, some monuments, deserving perhaps, at moments of leisure and inclination, a further examination. Afterwards you find yourself passing over a bog deeply cut by neighbouring tenants who have rights of turbury. This continues for miles, and at last you reach meadows and trees, and a reasonable, inhabitable kind of country, which leads you to the Bridge of Lisdoonvarna.

This bridge is of importance, and I'll have to return to it, for it must serve as a stand-point from whence to survey the localities that will have interest for you. But at present I am to suppose you hungry and tired, and wishing for refreshment and rest. Well, then, there are two inns—hotels I suppose I must call them—Reidy's and Ryan's. I don't wish to be partial, but I suspect that Reidy's is the one you'll stop at. It is the nearest, and you will at least get there a very tolerable dinner and good advice. I cannot promise that they can afford you beds, and I am almost sure they will not have a separate sitting-room for you, for the season is now approaching its fullest, but there is a very passable coffee-room, and a sitting-room for ladies. Mrs. Reidy will probably tell you that she can give you apartments in the "lodge"—a house some distance off, in which you will have to market for yourself, although she provides attendance. And I am given to understand that she has other houses at her disposal.

I would advise you not to dismiss your carriage until you have ascertained whether you can obtain accommodation at Reidy's; and if not, you had better drive at once to Miss Ryan. Neither hotel can be said to be remarkable for the excellence of its furniture. It would not be fair to compare them with the Westminster or the Louvre, and in fact Reidy's is somewhat the more pretentious: but in both you find cordiality and civility; and in both you will be honestly informed when the beds were last slept in, a fact not easily to be ascertained in establishments of a grander appearance. Miss Ryan's house has round it some space of grass land, on which an invalid may quietly saunter; and, moreover, she keeps a cow, and one has a chance of good cream, and sweet fresh butter. I see nothing to prevent a visitor being very comfortable in either of these houses, and if he cannot obtain accommodation in them, the proprietors will tell where lodgings can be obtained. In that case the lodger will have to *provide* himself, as it is called, and I find by inquiry that it is more economical to enter into an agreement with the hotel keeper for board and lodging. By this means, one can live in Lisdoonvarna at less than half the cost he could at the Crown or Granby. Perhaps the best way would be to communicate by letter with either of the hotel-keepers mentioned, stating the accommodation required, &c., before setting out for the west.

Now, to find your way to the spas, you must return to Lisdoonvarna Bridge, at right angles with the end of the Ennis Road, by which you were first conducted to the scene. Standing on this bridge, with your face towards Reidy's, you have their shop opposite to you, in which everything is sold, from a pennyworth of snuff to a five-shilling bottle of port or sherry, including bacon, tobacco, tea, whisky, &c. To your left is a baker's at the corner of the Ennis Road, and to your right is a butcher's. Looking steadily towards Reidy's shop, you may perceive two roads at an acute angle, forking front and rear of the hotel, which lies behind the shop. The road to the right leads to Ballaghaline and Ennistymon; that to the left to Glenevan, Kilfanora, and Corrofin. Turning round on the bridge, so that your back is opposite Reidy's shop, you see before you the road leading to Toovarragh, on the left of which is the Catholic chapel, and, at the distance of about three furlongs, the post-office. This distance is very inconvenient to the visitors, but a separate bag is made up at Ennis for all letters directed to Reidy's hotel, which are thus enabled to be distributed half-an-hour before those passing through the post-office. The post comes in at 10 A.M., and goes out at 3 P.M. Dublin letters are retained a night at Ennis. The Reidy's are very civil in affording the privilege of their special bag, not only to their own guests, but also to the other visitors at the spas.

Upon walking about a furlong along the Ballaghaline Road, you come to a bridge, beside which on the right is the magnesian spa, and a little further along the stream, the most favourite iron spa. An old woman lives in a cottage near these spas, who has the keys, and will supply a tumbler for drinking for a small gratuity. Crossing this bridge, and continuing along the Ballaghaline road, you will shortly arrive at the constabulary barracks to the right, opposite which is a road leading to the church, which is built on a plateau near a ravine, at the bottom of which is a sulphur spring, called by the country people "Dr. George's Spa," and a little above

it issues from another stratum of schistose rock, a chalybeate. The sulphur spring here is weak and milky, from deposited sulphur. Upon returning to the constabulary barracks, and walking farther along the Ballaghaline road, you arrive at another bridge, before which the Ennistymon road turns off to the left, some distance along which is a bridge with two arches, which presents to the peasantry a resemblance to a pair of spectacles, and they have accordingly denominated it in their humour the "Spectacle bridge." Near this is another celebrated iron spa, but which, from its distance, is but little used.

Returning to Lisdoonvarna Bridge, you can pursue your way along the Glenevan-road, passing to the left in front of Reidy's hotel, which will lead you at the distance of about a quarter of a-mile to another bridge, beside which is the principal sulphur spa—the favourite spring of the district. The reason of my taking the trouble to point out the locality of these various spas is that in the absence of any regular period of attendance, the distance of the springs from each other, and the want of that discipline which has gradually grown up at all the old-established watering-places, it is very difficult for a stranger at first to find his way to the spa he was recommended, particularly if he has no friend on the spot to direct him.

It remains only to say that if the patient requires a carriage to return to Ennis, he can obtain one by writing to Markham's hotel, Ennistymon, about seven miles off; or he can get any information he wants by applying to Mr. Markham's brother, who keeps the bakery already referred to, at the corner of the Ennis road, next Lisdoonvarna Bridge.—Your obedient servant, JOHN ALDRIDGE.

P.S.—The foregoing was written in a hurry immediately after my return to Dublin, but being late for insertion in the MEDICAL PRESS AND CIRCULAR, I take advantage of the delay to say a few words to the landed proprietors of Lisdoonvarna, and also to the innkeepers. To the former I would say the excellence of the water is admitted, and the locality may be made a mine of wealth if properly managed. But it has some faults which require to be remedied. First and chief, there is not a sufficient supply of the waters *collected* for the use of the visitors. This is entirely your fault, for nature supplies abundance of these medicinal liquids, but you have made only little miserable pits for collecting them, and permit the greater part to run to waste. You ought to employ a competent engineer to guide you as to the way of soliciting them into capacious reservoirs, which, in time, you might convert into handsome stone basins. Secondly, the place will never be complete without baths; and these would require a decent building, especially near the sulphur spring, with an elevated tank for douches, and means of raising the temperature of the water, both for these and ordinary bathing. The ordinary metal baths, sold at the ironmongers, would answer even better than the expensive marble baths, or those lined with tiles, which, being bad conductors, heat slowly, and are consequently uncomfortable. A clean waiting-room adjacent is also necessary. Some kind of Conversation House near the hotels is desirable, in which might be a small circulating library, and a room for occasional concerts or other recreation. Lastly, the proprietors ought to do something in the way of belts of trees to protect from the keen winds to which this high table-land is occasionally subject; in this they might learn much from the example of Harrogate.

Now, to the hotel-keepers I would say, proper respect for your lodgers require some better means of conveyance than the dislocating, high outside cars, with bad cushions, rough springs, and steps so elevated that it would almost require an acrobat to mount them. I have seen near Beaumaris neat light phaetons, drawn by jennets, which, I was informed, cost less than £20—phaeton, jennet, harness, and all. Could not something similar be obtained for Lisdoonvarna? Surely you are not willing to be beaten by the Welch.

But I have strong hopes that these and many other improvements will be in time carried out. J. A.

A SOCIETY FOR THE RELIEF OF THE WIDOWS OF POOR-LAW MEDICAL OFFICERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have withheld this, my second letter, that I might be enabled to learn from the proceedings of the late meeting of the Medical Association of Ireland if any, and what steps were suggested or taken by them, in reference to a *certain annual provision* for the widows and children of such Poor-law medical officers as have inadequate means for their support. I find that no reference was made to the subject, the meeting confining itself to the arrangements connected with the Medical Benevolent Fund Society which, though very useful, is admittedly insufficient to meet the necessities of the numbers that from year to year are left widowed and fatherless by the demise of the proportion of the 800, or 900 Poor-law medical officers, who were hitherto their only support. In THE MEDICAL PRESS of the 21st of January, 1864, you observe, "The Medical Benevolent Fund can never be adequate to provide for even a moiety of the distress which has existed amongst the families of deceased medical men." It is only necessary to read the report and the proceedings of the late meeting to confirm that opinion, as the Committee, whilst congratulating the Society on increased funds, observes that "the pecuniary aid extended to most of the claimants, instead of being, as it ought, liberal, is but a narrow pittance"—"but very rarely sufficient to be of any *permanent* advantage to the recipients."

Having further considered the subject, and obtained more information in respect to it, I beg to offer the following data and suggestions for the formation of a Poor-law Medical Officers' Annuity Widow's Society.

I have not yet seen the Poor-law Commissioners Report for the year ended September, 1866, but that for September, 1865, shows that there were then 785 dispensary medical officers, and that their salaries, including payments for vaccinations, amounted to £78,287 in that year. If to this be added payment for registration at, I hope, not less than an average of £10 for each dispensary district, or £7160, the whole would be an annual payment by Boards of Guardians to dispensary medical officers of £85,447. Mr. Cogan's return shows that there are 187 workhouse medical officers whose salaries amount to £13,883 yearly. I find that 85 of this class hold dispensaries. All may be thus classed:—

700	Dispensary medical officers at £109 each,	£76,300
85	Workhouse and dispensary medical officers at £183 each, . . .	15,555
102	Workhouse medical officers at £74 each,	7,548
Total 887	Total	£99,403

Total annual payments to Poor-law medical officers, or say, in round numbers, £100,000.

If, to create a fund, each medical officer pays one per cent., £1000 would at once be realised, and if two per cent. be deducted annually from the salary of each married, and one per cent. from that of each unmarried medical officer, assuming the former class to amount to 600, the latter to 285, about £1665 would be raised annually, and a beginning would be made with about £2665. This annual deduction from the salaries would provide £40 annually for about forty-two widows, leaving the £1000 untouched; but as the mortality of the medical officers, say from the ages of 25 to 65 would be two and three-fifths, or say three per cent., and as their wives would not have a higher mortality than two and one-fifth per cent., being almost invariably younger than the husband, in a few years the subscription would have to be increased, or the amount of annuity diminished, or assistance should be had from some other source. In any case care should be taken not to interfere with the means by which funds are had for the existing Medical Benevolent Society.

I learn from Mr. McEvoy, M.P. for Meath, and who deserves much credit for it, that £65,000 has been voted by Parliament to meet one-half the cost of the salaries of the medical officers of dispensaries, and of the workhouse schoolmasters and schoolmistresses, and that this fund is to be put at the disposal of the Boards of Guardians in saving of the Union rates. I would earnestly advise that it be understood by Government and Parliament that as much of this annual grant be added to the Poor-law Medical Officers' Widow's Annuity Society Fund, as these Poor-law Medical Officers contribute, say about £1665 annually. There would then be adequate funds to meet the payment of £40 yearly to each widow, or to her children, on the death of the mother, until, as is the case with the Irish Constabulary Widow's Society, the children reach eighteen years of age.

If judicious means be adopted it is not likely that Government would object to this appropriation of a very moderate portion of this Parliamentary grant, or to twice the sum, and it would be strange if the Poor-law Commissioners should not urge its adoption, as it would so much benefit the Medical Officers in their department.

It may be suggested that the existing Medical Benevolent Fund Society should rather have a portion of this Parliamen-

tary grant, and in that case it may be supposed that any other Medical Benevolent Society would be unnecessary.

But though the objects of both may appear to be the same, they are, in fact, very different. The existing society is intended, so far as it has means, to relieve the distress of *any* medical man, or that of his widow and children, so that the distressed of the whole medical population of Ireland may legitimately be claimants, though these claimants had never contributed to the fund. The Poor-law Medical Officers' Widow's Society would be for the benefit of the families of a certain number of individuals who contribute themselves, and thus make a moderate provision, not for themselves, but for their wives and children. Both societies ought to work harmoniously together, the one supplementing what was wanting in the other.

It may be supposed that it would be difficult to induce many of the Poor-law Medical officers to join such a society, but were a rule adopted similar to that which I stated in my letter in the MEDICAL PRESS of December 14th, 1864, very few, I think, would hold back.

Of course the rules and regulations of such a society should be carefully considered, and the proportion to be contributed would require good consideration.

As it is well-known that the medical relief which is afforded by dispensaries, and in the workhouse, fever hospitals, and infirmaries, constitutes a most valuable portion of the benefits arising from the Poor-law, Government and Parliament would probably not be over stringent in favouring such a society. In the year ended September 1865, the Dispensary Medical Officers visited 202,333 sick persons who were unable to leave their beds, exclusive of 635,800 others who attended at the dispensary depots. And the workhouse fever hospitals and infirmaries treated 62,291 sick, of whom 18410 were affected with fever and other contagious diseases ; 43,881 with other medical and surgical diseases. The benefits derived by the whole community from this extent of medical attendance by competent professional men will, it is to be hoped, be fully appreciated ; if it be, there will be no objection to giving pecuniary means to provide a fund for their distressed widows and fatherless children.

The whole cost of dispensaries in the year was £117,038 ; that of the medical relief in workhouses may be fairly estimated (it is not given in the report) at £60,000 ; making, for medical relief, about £177,000. I had hoped that the half of this would have been granted by parliament, *but "all in due time."*

Had I any influence with Government, Parliament, the Poor-law Commissioners, or with the Poor-law Medical Officers, I would earnestly press the consideration of some such society, as is above suggested, on their serious attention.—Yours, &c.,

DENIS PHELAN.

Medical News.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—On the 25th ult., at the annual meeting of the Fellows, more than the usual amount of business was transacted. There was no black-balling on the occasion, and so the only grumbling has been of that kind which has attached to the government of this antiquated Corporation for many years. The list of office-bearers for the year we published last week. The following gentlemen were promoted to the Fellowship :—

Dr. Russell, of Birmingham ; Dr. Wardell, of Tunbridge Wells ; Dr. Bridges, of Bradford ; Dr. Waters, of Liverpool ; Dr. Logan, Director General of the Army Medical Department ; Dr. J. Harley, of King's College ; Dr. J. Clark, of St. George's ; and Dr. Hillier, of University College ; Dr. G. T. Gream.

The following were admitted members of the College :—

George Fowler Bodington ; Stephen Monckton, M.D. ; Thomas Buzzard, M.D. ; William Henry Day, M.D. ; W. Ainslie Hollis, M.B. ; Richard Thorne Thorne, M.B. ; Walter Rickards, M.D. ; Prosser James, M.D. ; P. J. Hensley, M.B.

UNIVERSITY OF DUBLIN.—The following is the authorized list of persons on whom degrees and licenses were conferred at the "Comitia Æstiva. Habita tertio die Julii, 1867 :"—

BACCALAUREI IN ARTIBUS.—*Moderator Senior*—Guilielmus Bailey Wallace, *(sch.) Moderator Junior*—Ulysses Radolphus Burke. *Pensionarii et Sizatores*—Gualterus Hubertus Beaurepaire *(ex-sch.)*, Johannes Bell, Carolus Albertus Bestall, Johannes Bole, Johannes Boyle, Horatius Newman Brady, Guilielmus Dionysius Browne, Johannes Carter, Ricardus Guilielmus Henricus Dawson, Jacobus Stewart Sweete Escott, Eduinus Spencer Gough, Georgius Fred. Helm *(ad eundum)*, Carolus Kough, Robertus Mayer Linton, Horatio Edmundus Maunsell, Alfredus Lloyd Owen, Johannes Thomas Read, Jacobus Thomas Kennedy Reed, Guilielmus Kemmis Shortt *(n. f. sch.)*, Johannes Williamson.

LICENTIATI IN ARTE INGENIARIA.—Georgius H. D. Bayley, Edvardus L. D. Hunt, Carolus Vernon D. Mac Ivor, Jacobus Thomas Kennedy Reed.

LICENTIATUS IN MEDICINA.—Ricardus Johannes Kinkead.

Baccalaurei in Medicinâ.—Geo. Fred. Helm, Jacobus Henricus Reynolds, Samuel Kyle Cotter, Georgius Edvardus Dobson, Carolus Fredericus Pollock, Henricus Jagoe, Alexander D. Henry, Valentinus Duke, Samuel Lane Popham, Gulielmus Albertus Paxton, Gulielmus Tyndall Watson, Geraldus Franciscus Yeo, Horatio Scott, Alfredus Lloyd Owen, Hor. Edmund Maunsell, Gul. Henricus Goode, Carolus G. M'Dowell.

Baccalaurei in utroque Jure.—Johannes Bell, Thomas Henricus Barton, Gulielmus Frazer Nash, Henricus Ricardus Parker, Georgius Fr. T. Drapes, Gulielmus Crozier, Henricus Oliverus Barker.

Magistri in Chirurgiâ.—Henricus Jagoe, Samuel Kyle Cotter, Carolus Fredericus Pollock, Samuel Lane Popham, Geraldus Francicus, Yeo, Jacobus H. Reynolds.

Magistri in Artibus.—Edvardus Maunsell, Carolus Hare Phipps, Rev. Georgius A. Chadwick, Rev. Gulielmus Lefroy, Rev. Mich. Smith Daly, Jacobus Rowley, Rev. Rob. H. Falkner, Gulielmus Henricus St. Monck *(stip. cond.)*, Rev. Thomas Alex. Hughes, Rev. Joh. Geor. Norton, Rev. Thos. M'Nally, Gul. Henricus Craig, Rev. Johannes Chute, Rev. Edwinis W. Jonas, Rev. Ricardus Gul. Vigors, Rev. Oliverus Gul. Stokes, Rev. Fredericus Tymons, Gulielmus Watson, Arthurus Seamer, Rev. Joh. Alex. Stewart, Rev. Geo. Patr. Keogh, Rev. Johannes Williams, Rev. Samuel Benton Brasher.

Baccalaurei in Theologiâ.—Rev. Mauritius F. Day *(stip. cond.)*, Rev. Johannes Hart Burges.

Doctores in Medicinâ.—Geo. Fred. Helm, Mauritius Collis, Gulielmus Tyndale Watson.

Doctores in utroque Jure.—Gulielmus Crozier, Thos. Henricus Barton, Digby Pilot Starkey *(Honoris causâ)*, Johannes Forster *(Honoris causâ.)*

Doctores in Theologiâ.—Rev. Mauritius F. Day *(stip. cond.)*, Rev. Johannes Hart Burges.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following is the result of the election on Thursday last. Out of 300 Fellows who voted, 135 were Fellows by examination :—

Mr. Prescott Hewett	189	
Mr. Spencer Smith	143	Equal.
Mr. John Birkett	143	Equal.
Mr. Luther Holden	136	
Mr. F. C. Skey	87	
Mr. Thos. Wormald	55	
Mr. Francis Kiernan	30	

THE SURGEON OF THE DIANA.—It is so seldom that members of our profession meet with their due, in the shape of public acknowledgment, that we have great pleasure in reproducing from the *Times* of the 2nd inst., an account of the testimonial to Mr. Smith, of Coggleshall, presented on the 29th ult :—On Saturday a special meeting of the Hull Local Marine Board was held at the Board-office, under the presidency of Mr. H. J. Atkinson, the chairman, for the purpose of presenting to Mr. Charles Edward Smith, a testimonial, as a recognition of his service as surgeon of the whaler *Diana* of Hull, which was beset in the Arctic seas during last winter. On Mr. Smith entering the room he was informed that a special meeting of that Board had been called in consequence of a despatch having been received from the Board of Trade, awarding him a testimonial for his gallant conduct under very trying circumstances. Accompanying the testimonial there was a case of surgical instruments. The testimonial, which was beautifully illuminated, ran as follows :—"To Charles Edward Smith, of Coggleshall, Essex, late surgeon of the whaler Diana of Hull, in recognition of his generous, humane, and unwearied services to the crew of that vessel, while they were suffering from a severe attack of scurvy, aggravated by their dangerous position and detention in the ice, and by want of food, clothes, and other necessaries. This testimonial, accompanied by a case of surgical instruments, is presented by the Board of Trade, this 24th day of June, 1867,—RICHMOND, President, THOMAS GRAY, Assistant, Marine Department." The Board of Trade had requested that the testimonial should be presented in a public manner, and the chairman trusted that through the press the presentation would receive the same publicity which the story of the hardships and sufferings of the unfortunate crew had done. Mr. Smith, in reply, said he was at a loss for words suitably to return thanks for the great honour which had been done him. It was but seldom that such an adventure as his occurred to surgeons, either at sea or on land, and it was more than he could expect, occupying as he had done the humble position of surgeon on board a whaler, to receive such a distinguished honour. He could not refrain from saying a word on behalf of the gallant crew, for when he looked back upon that fearful voyage, and the dreadful struggle they had

for life under overwhelming hardships, worn out with hard work and constant pumping, with a debilitating disease among them, he must say that the country ought to be proud of those brave men. Captain Allen Young had journeyed to Hull to see the vessel, and he had expressed the greatest admiration for those gallant fellows, most of whom had been reared and trained by that gray-headed old man, Captain Gravill, who perished amid "that dreary waste of snow and ice." In conclusion, he desired sincerely to thank the British Government, through the Hull Local Marine Board.

INSANITY IN ENGLAND.—The number of insane persons in England and Wales liable to official visitation at the beginning of the present year (according to the official report of the Lunacy Commissioners) was 49,082, an increase of 15,291 over the number ten years ago. 42,943 were paupers, seventh-eighths of the whole number; and more than 10,000 of these are in workhouses. Provision is made in asylums for only 61 in a hundred of the insane poor; the pressure for further accommodation is most urgent in many districts, and it is unsatisfactory to observe the tendencies in many counties to remove the harmless chronic cases to the workhouse, where they must receive inferior treatment. Of the private lunatic patients visited, 6139 in all, the great mass are persons in licensed houses and hospitals; only 223 are persons residing as single patients with relatives or others. But there is no doubt that this last number does not all represent the patients who ought legally to be visited by the Commissioners, and that a very large number are still received to board and lodge, or to be taken care or charge of for profit, by persons other than committees appointed by the Lord Chancellor; and the Commissioners express their fear that grave abuses still frequently exist in reference to the treatment of this class of the insane. Of the 24,748 pauper patients in public asylums in England on the 1st of January, 1867, only 10 per cent. are described as offering any hope of recovery; of the 22,257 incurable, two-thirds are returned as "excited, violent, or dangerous," and one-third "quiet and harmless." At the commencement of the year 1866 there were 30,868 lunatics in asylums, hospitals, and licensed houses, and 31,914 at the close of the year; in the course of the year 3,432 were discharged recovered, and 3,223 died.

CHARGE AGAINST A DENTIST.—At the Greenwich Police Court last week, a servant charged a dentist with having committed a rape upon her whilst she was under the influence of chloroform, for the purpose of having a tooth extracted. The defendant's servant asserted that she was in the room while the operation was being performed, and that her master was innocent of the charge. Yet the dentist was committed for trial, and will have to undergo—whether innocent or not—the untold agonies of suspense. So awful an accusation—and, as it happened in this case, from an accuser who was proved to have told her mistress a falsehood as to where she had spent Whit-Monday—may inflict upon any one the greatest misery. It seems hard that, with a witness testifying that the charge was unfounded, any further enquiry should be necessary. The bare possibility of charges of this kind being trumped up gives the profession a terrible interest in such events. It would seem that the presence of the operator's servant is an insufficient protection.

THE LATE SIR WM. LAWRENCE.—On Friday last the veteran Sergeant-Surgeon to the Queen, whose illness we have lately noticed, expired at his residence in Whitehall-place. So much did his vigorous constitution rally from the attack with which he was seized two months ago, that some of his more sanguine friends, notwithstanding his great age, entertained hopes of his recovery until the last relapse, which occurred two days before his death. As long ago as 1815 Wm. Lawrence had reached the post of Professor of Anatomy and Surgery at the Royal College of Surgeons. He was then known as a most zealous and hard-working man, which he has continued so to be ever since. In fact, he may almost be said to have died in harness; for the day before the fatal seizure he had been at Bethlem Hospital, and there made an appointment for the next day, which paralysis prevented his keeping. His long service at St. Bartholomew's Hospital has often been commented upon. Amongst his writings we should enumerate as most remarkable, his "Lectures on Physiology and the Natural History of Man," and his introduction to "Comparative Anatomy and Physiology." More strictly practical were his "Treatise on Ruptures" and his "Diseases of the Eye,' but these by no means exhaust the catalogue of his literary labours. Since his illness he had resigned the post of examiner at the College of Surgeons. His seat at the Council is now also vacant. He died at the age of 83, and is succeeded in the baronetcy, so recently created, by his son, an able and accomplished member of the medical profession, who will not fail to reflect credit on the title his father won, but wore for so short a period.

HER ROYAL HIGHNESS THE PRINCESS OF WALES.—As announced in our columns, on the 26th ult., the improvement in the condition of Her Royal Highness was so marked as to permit the eminent gentlemen in attendance to encourage the hope of the early resumption of carriage exercise. It was, however, deemed prudent to postpone removal for a few days, in order that recovery might be more decided, and to avoid the risk of a relapse to their illustrious patient. During the past week Her Royal Highness had been visited by Her Majesty the Queen, the Queen of Prussia, and other members of the Royal Family. On Saturday last, the Royal pair were to be seen again in the Parks, where their presence excited considerable enthusiasm. The healthy and cheerful appearance of Her Royal Highness excited general remark.

THE PRINCESS OF WALES.—It was anticipated the Princess would have been in Hyde Park on the occasion of the intended review of last Friday, which was at the last moment postponed, out of respect to the memory of Maximilian. Her Royal Highness is able to take out-door exercise, and will soon become once more familiar in the park drives.

ROYALTY IN THE HOSPITALS.—The Prince and Princess Louise of Hesse and the Princess Louise, have during the week visited several of the London Hospitals. It is well for the highly placed to take an interest in the lowly, and especially the sick. There is little use, however, in the dry chronicle of the names of those who received the visitors to which our contemporaries devoted their space.

HUNTERIAN MUSEUM.—The very valuable museum of the late Mr. Toynbee, consisting of an unrivalled series of specimens illustrative of Aural Pathology, has been acquired by the London College of Surgeons, and added to the great Hunterian Collection. Mr. Toynbee was, as is well-known throughout his career, a most diligent worker in this department of pathology, and it is gratifying to know that the labour he bestowed upon it will thus be preserved. Considering the poverty, as to aural pathology, of most museums, including the Hunterian itself, until this acquisition, we know of no specimens that could have been obtained equal to these for completeness. The college may now boast of the best aural museum in Europe.

TURKISH BATH.—The following report from the medical officer was read at the last meeting of the Board of Guardians, Fermoy Union:—"The Turkish bath, after a trial of four years in the Fermoy Workhouse, has been found a useful remedial agent in a large class of cases—for example in congestive and inflammatory states of the internal organs and viscera, the lungs, liver, and kidneys in particular, renal dropsy, Bright's disease, &c. In virtue of its eliminating process it has been successfully employed in the treatment of rheumatism, sciatica, and gout. On the whole, I regard the Turkish bath as a valuable aid to medicine in the treatment of disease, and of every extended, though not universal, applicability.—JOHN ROCHE, M.D."

NOTICES TO CORRESPONDENTS.

IS MEDICAL REGISTRATION NECESSARY?

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have been asked the above question several times within the last few days, under the following circumstances, viz.—A gentleman, *to be presumed qualified* (as his name does not appear in the "Medical Register" for the current year, he may or may not have obtained a medical qualification), is called to a case, which he treats, and meets a duly-qualified and registered Practitioner, and together they attend the case to a successful issue, and receive the usual honorarium. The same gentleman attends other cases; in fact obtains a fair share of practice, and does not refuse the fees consequent thereon. And all the time he has never thought fit to comply with the requirements of the Medical Act regarding registration of his qualifications *(if any)*, his only distinguishing mark being "Dr." on his door, and "M.D." after his name in "Thom's Directory."

Now, sir, I would ask, does the Medical Act make it compulsory on all qualified men embarking in practice to register, and if not, why not? While on the subject of registration, I would suggest an alteration in

the existing rule as to change of residence, and instead of leaving it optional with a medical man to insert his new place of abode, I would propose it should be made compulsory. Neglect of this is calculated to lead to much evil; for instance, suppose a qualified man to die, a friend or neighbour may assume his diplomas, &c., and start for practice in another locality, where he is unknown. When questioned as to non-registration of his qualifications, he quietly points to the name of the deceased, cooly assuring his interrogator that he did not think it worth his while changing the address, *as he was so well known!* I assure you, sir, there is an instance not a hundred miles from town, owing to non-insertion of change of residence, which I would not be at all surprised to find, answered very closely to the above stratagem, which, believe me, is not by any means imaginary. Hoping some of your numerous readers will join me in bringing the above points prominently before the notice of the Medical Council, viz.—1. To render it compulsory on every one obtaining a Medical or Surgical qualification to register same before commencing practice; and 2. To make it compulsory for every registered Medical man, on changing his residence, to insert his new place of abode in the "Medical Register" for the current year. Apoligising for trespassing so far on your space, I remain, yours obediently,

JOHN S. A. CUNNINGHAM, M.D.

Grosvenor-road, East, Rathmines, June 28th, 1867.

[No Medical Practitioner need register unless he wishes, and, in point of fact, many object, we think advisedly, to do so, not wishing their names to appear side by side with persons who, though legally qualified, occupy an inferior position in the Profession. In omitting to register, a Medical man foregoes the right of recovery of his fees in courts of law, the reception of any legal certificate from him, and the holding of any public appointment; and the loss of these privileges is the only penalty. —ED. M. P. & C.]

MEDICAL VACANCIES.

Battle Union (Districts Nos. 1 and 2 and Workhouse)—Medical Officer.
Freebridge, Lynn Union—District Medical Officer.
Hereford General Infirmary—House-Surgeon.
Leominster Union—Medical Officer for the Workhouse and No. 1 District.
Surrey Dispensary—Physician, *vice* Dr. Gervis, resigned.

MEDICAL APPOINTMENTS.

ADAMS, G., M.R.C.S.E., has been appointed Medical Officer for District No. 2 of the Bedminster Union, Somersetshire, vice W. F. Carter, L.R.C.P.Ed., resigned.
BASAN, H., L.R.C.P.Ed., has been appointed Resident Apothecary to the St. Marylebone General Dispensary, vice T. Peete, M.D., resigned.
BLACK, D., M.B., has been appointed Medical Officer and Public Vaccinator for the Parish of Kilfinichen, Argyllshire, vice J. M'Nab, M.D., resigned on being appointed Medical Officer and Public Vaccinator for the Parish of Assynt, Sutherlandshire.
CHILD, E., M.R.C.S., has been appointed Medical Officer and Public Vaccinator for the New Malden District of the Kingston Union.
CORLEY, A. H., M.D., F.R.C.S.I., Lecturer on Anatomy at the Carmichael School of Medicine, has been appointed Surgeon to Jervis-street, Hospital, Dublin.
FERNIE, J., M.R.C.S.E., has been reappointed Medical Officer for District No. 3 of the Upton-on-Severn Union, Worcestershire.
GREEN, E. S., L.R.C.P.Ed., &c., has been appointed Medical Officer and Public Vaccinator for the Settle and Horton-in-Ribblesdale Districts and the Workhouse of the Settle Union, Yorkshire, vice R. Simpson, L.R.C.P.Ed., resigned.
JACKSON, G., L.R.C.P.L., &c., has been appointed Medical Officer and Public Vaccinator for District No. 3 of the Plymouth Union.
M'LEAN, Dr., has been appointed Medical Officer for the 10th District, Barony Parish, Glasgow, vice M. Thomas, M.D., appointed Medical Superintendent of the Glasgow Royal Infirmary.
MARTIN, T. H., M.R.C.S.E., has been re-appointed Medical Officer for District No. 5 of the Horsham Union, Sussex.
PEARSE, F. E., L.R.C.P.Ed., has been appointed Medical Officer and Public Vaccinator for District No. 6 of the Wellington Union, Somersetshire, vice W. B. W. Webber, L.S.A.L., deceased.
PIERCEY, W. L., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Trimdon (a new) District of the Sedgefield Union, Durham.
REYNOLDS, W., M.R.C.S.E., has been appointed Medical Officer for the Workhouse of the Wellington Union, Somersetshire, vice W. B. W. Webber, L.S.A.L., deceased.
RIGG, T., M.D., has been appointed Medical Officer for the Bowness District of the Wigton Union, Cumberland.
SHERATON, G. R., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Sedgefield District and the Workhouse of the Sedgefield Union, Durham, vice H. J. Ruddock, M.R.C.S.E., resigned.
STEPHENSON, W. H., M.D., has been appointed Medical Officer for the Blackburn No. 3 District of the Blackburn Union, Lancashire, vice W. E. Smith, M.R.C.S.E., resigned.
TURNER, A. C., M.R.C.S.E., has been appointed Medical Officer for Districts Nos. 1 and 2 of the Woodbridge Union, Suffolk, vice W. N. Walker. M.R.C.S.E., resigned.
WALSH, W., L.K.Q.C.P.I., has been appointed Medical Officer and Public Vaccinator for the Whitmore District of the Newcastle-under-Lyme Union, and Certifying Factory Surgeon for the Newcastle-under-Lyme District, vice G. Barnes, L.R.C.P.Ed., resigned.
WRIGHT, T. P., M.R.C.S.E., has been appointed Surgeon to the House of Correction at Wandsworth, vice W. Harris, F.R.C.S.E., resigned on account of ill-health arising from injury received in the execution of his duty.

MILITARY AND NAVAL MEDICAL APPOINTMENTS.

BETT, R. L., M.R.C.S.E., Assistant-Surgeon R.N., has been appointed to the "Malabar."
BLATHERWICK, T., M.R.C.S.E., Staff-Surgeon Army, having completed twenty years' full pay service, has been promoted to Staff Surgeon-Major under the provisions of the Royal Warrant of the 1st of April.
BURKE, J., L.R.C.S.I., Staff Surg.-Major Army, has been promoted to Deputy Inspector-General of Hospitals on retiring upon full pay.
CALDWELL, J., M.R.C.S.E., Surgeon R.N., has been appointed to the "Britannia."
COOPER, G. C., has been appointed Assistant-Surgeon to the 3rd Middlesex Artillery Volunteer Corps.
CRAWFORD, W., L.R.C.S.Ed., Surgeon R.N., has been appointed to the "Fisgard," for temporary service.
CRISP, W., M.R.C.S.E., Staff Assistant-Surgeon Army, has been appointed Assistant-Surgeon to the 3rd Foot, vice Wilson, appointed to the Royal Artillery.
CULLEN, W. F., L.F.P. & S. Glas., Staff Assistant-Surgeon Army, has been promoted to Staff Surgeon, vice Burke, who has retired upon full pay.
GAUSSEN, J. R., M.B., Staff Assistant-Surgeon Army, has been appointed Assistant-Surgeon Royal Artillery, vice Temple, appointed to the Staff.
M'WHARRIE, R., M.D., Surgeon-Major Army, has been promoted to Deputy Inspector-General of Hospitals, on retiring upon full pay.
PLOMLEY, J. F., has been appointed Assistant-Surgeon to the 1st Kent Rifle Volunteer Corps, vice Sankey, resigned.
PRALL, S., M.D., has been appointed Hon. Assistant-Surgeon to the 39th Kent Rifle Volunteers Corps, vice W. F. Keddell, M.R.C.S.E., resigned.
PROVIS, W. A., M.R.C.S.E., has been appointed Assistant-Surgeon to the 8th Cheshire Rifle Volunteer Corps, vice Mayer, deceased.
RIORDAN, T. T., L.R.C.S.I., Assistant-Surgeon R.N., has been appointed to Haslar Hospital.
ROE, W. C., L.R.C.S.I., Staff Surgeon Army, has been appointed Surgeon to the 59th Foot, vice M'Wharrie, M.D., who has retired upon full pay.

Births, Marriages, and Deaths.

BIRTHS.

WILLIAMS.—On the 26th ult., at Montagu-square, the wife of A. Wynn Williams, M.D., of a son.
BUCKENHAM.—On the 27th ult., at Huntingdon House, Cambridge, the wife of John Buckenham, L.R.C.P.Ed., of a daughter.
FARR.—On the 27th ult., at West-square, St. George's-road, the wife of Dr. G. F. Farr, of a son.
BATEMAN.—On the 28th ult., at Compton-terrace, Canonbury, the wife of H. Bateman, F.R.C.S.E., of a daughter
SHEPARD.—On the 28th ult., at the Swyn, Usk, the wife of A. J. Shepard, M.R.C.S., of a daughter.

MARRIAGES.

EDWARDS, GARDNER.—On the 13th ult., at Rugeley, Henry Nelson Edwards, Esq., Surgeon, of Shrewsbury, to Catherine, only child of the late Thos. Gardner, Esq., of Rugeley.
WRIGHT, NEAL.—On the 15th ult., at Birmingham, M. H. Wright, M.R.C.S.E., third son of A. Wright, Esq., of Lincoln-street, Leicester, to Eliza Breward, only daughter of the late Henry Neal, Esq., of Castle Mills, Leicester.
NANKIVELL, AITKEN.—On the 27th ult., at St. John's Church, Pendeen, Cornwall, Herbert Nankivell, M.D., of Doncaster, to Etheldreda, youngest daughter of the Rev. R. Aitken, of Pendeen. No cards.
M'DERMOTT, SLATTERY.—On the 2nd instant, at Lismore, P. A. M'Dermott, Esq., Surgeon, 2nd Depot Battalion, Chatham, to Annie, only daughter of John Slattery, Esq., of Lismore, Co. Waterford.
LYNES, HUGHES.—On the 2nd inst., at Holy Trinity Church, Coventry, Edward Lynes, M.D., to Ellen, second daughter of Andrew Hughes, Esq., of that city.

DEATHS.

TAYLOR.—On the 8th of May, at sea, on board the steamship "Natal," Geo. Taylor, M.D., Deputy Inspector-General of Hospitals.
HUNTER.—On the 22nd ult., R. H. A. Hunter, L.R.C.S.Ed., of Dollar, Stirlingshire, 1st Class Staff-Surgeon Army, on half-pay, aged 61.
JOHNSON.—On the 24th ult., at Malvernbury, Great Malvern, E. Johnson, M.D., formerly of Umbersdale Hall, Warwickshire, aged 66.
PHIPPS.—On the 26th ult., at Cheltenham, J. G. Phipps, M.D., aged 49.
HARTE.—On the 26th ult., J. F. Harte, L.R.C.S.I., of Coolrain, Mountrath, Queen's County, aged 35.

Original Communications.

ON THE INFLUENCE OF CLIMATE IN THE PREVENTION AND CURE OF CHRONIC TUBERCULAR PHTHISIS.

By EDWIN LEE, M.D., Etc.

[*Abstract of a Communication read and discussed at the Annual Meeting of the Scientific Congress of France, held at Aix, in Provence, and at Nice, in December*, 1866; *with additional observations on the subject.*]

In offering to the consideration of the Medical Section of the Scientific Congress, the following brief observations respecting the influence of climate as a prophylactic and remedial agent in tuberculous disease of the lungs, I assume, as a basis, the conviction now generally entertained by the most enlightened members of the medical profession, that this disease is curable in a large proportion of cases; and even when not curable, that its progress may very often be arrested, so as to enable the patient to live for a long time in a tolerable state, and exempt from suffering. The opinion of the incurability of pulmonary consumption which formerly prevailed, was in great measure owing to the erroneous idea that was very generally formed of the nature of the disease—the attention of practitioners and of the public being too exclusively restricted to the local organic lesion, without taking sufficiently into account the abnormal condition of the system on which the lesion depended, and the predisposing causes which chiefly tended to produce it. The treatment, being directed in this sense, at best only occasioned partial and temporary ameliorations, while almost invariably the disease progressed more or less rapidly to its fatal termination.

That the morbid condition of the system which gives rise to pulmonary phthisis (when not of an hereditary nature) is mainly referrible to anti-hygienic atmospheric influences, is proved by the general prevalence of the disease among the population of countries and localities where similar influences are most observed, and among those classes who are most exposed to their action. Thus, in all countries where the climate during the greater part of the year is humid, and at the same time cold and variable, consumption prevails to a much greater extent than elsewhere. That this prevalence is not owing to the low temperature, nor to the variations of the atmosphere separately considered, but is referrible to its humidity, is demonstrated by the circumstance that in many parts of Russia, in Sweden, Norway, and other northern countries where the air is dry, the disease is of unfrequent occurrence; whereas, it is extremely prevalent in many parts of France, in Germany, in Great Britain and Ireland, where humidity is a predominating characteristic of the climate. Nowhere is the mortality from phthisis greater than in Holland.

In the above-mentioned northern countries, the inhabitants are for the most part engaged in out-door avocations, and are but little addicted to in-door and sedentary pursuits, in which a large proportion of the population of countries more advanced in civilisation is engaged, and which materially conduce to deteriorate the constitution—in the same way as humidity—by preventing the free action of the skin, and thus predispose to pulmonary disease; whereas, an active out-door life, in fine dry weather, greatly promotes this action, and acts as a preventive.

On the other hand, in countries where humidity is combined with heat, consumption is prevalent, as in several portions of Africa, Asia, and South America, especially in the Lower Brazils, several of the West India Islands, the shores of Peru; whereas, in the mountainous regions of these countries, as the elevated plateaus of Peru and Mexico, where the air is light and dry, it is almost unknown among the indigenous populations.

A French physician made a series of observations several years ago in his own, and in other countries, in order to ascertain the relative frequency of tubercular disease among the inhabitants of different localities, under different circumstances of situation and mode of life, and he remarks with respect to France—that in the small towns, where the population is composed of agriculturists, artisans, and trades-people, the proportion of deaths from pulmonary consumption is as one to forty or fifty of the general mortality, where the towns are situate on the acclivity of mountains, on elevated table-lands, in dry valleys accessible to winds, or in fertile plains, but that, under these conditions, the disease does not occur with the same degree of frequency in the different classes—"It is very rare among the agriculturists and artisans who actively exercise their limbs, but it attacks almost exclusively persons who usually remain in-doors, using only their hands or fingers for their work. Individuals who are exposed to the action of humidity only while at work, do not become consumptive, where their physical powers are actively engaged, as tanners, wool-washers, washer-women, dyers, the expansive and sudorific influence of muscular exercise sufficing to preserve them from the disease.

"In villages favourably situate, where there are no sedentary avocations, and where the inhabitants are engaged in working in the fields, the average mortality from consumption is not more than one in eighty of the general mortality. Hence it may be laid down as a principle, that in order to preserve men and animals from tubercular affections they must be freely exposed to atmospheric influences.

"In Holland, sedentary occupations concur with humidity to increase the amount of pulmonary consumption. What more especially predisposes women to this affection is their lymphatic constitution and sedentary mode of life, for the women who inhabit the healthy villages of France, Belgium, or Italy, and who, like the men, follow agricultural pursuits, are exempt. But in the damp climates of Holland and England, the conditions are no longer the same. The humidity exerts a general influence which muscular exercise cannot always counteract; it even happens that by producing sweating, exercise renders the body more subject to the concentered and debilitating influence of cold and humidity.

"The effects of seclusion and sedentary occupation are seen on a large scale among the work-people employed in the silk manufactories at Lyons (where, moreover, the climate is very humid). It appears, from a statment of M. M. Brachet and Rougier, physicians to the hospital, that out of 250 deaths occurring in this section of the population, 82 were from consumption. At Nismes, notwithstanding the superiority of the climate, the silk manufactories favour the development of scrofula and phthisis, which circumstance arises from the operatives constantly remaining within doors, for at Arles most of the consumptive patients who died in the hospital had pursued sedentary occupations, not connected with silk works. The proportion of deaths from this disease to the general mortality was one-third. At Rouen the two most general causes of tuberculous disease—humidity and working in the manufactories—exert their influence upon the population. One-fourth of the patients who die in the hospitals succumb to consumption, which is much less frequent among other working classes not suffering from privation. It is very rare among those who work in the port, and among sailors, as also among the dyers, who are very numerous along the banks of the little river Robec. The former of these classes are robust, well-fed, and often intemperate. But in both these classes of operatives the expansive and sudorific action of exercise suffices to counteract the noxious influence of external agencies—viz., the dampness of the climate, and of the localities where it is most prevalent.

"In examining the influence of humidity, under different conditions, we see that it gives rise to serious acute diseases, and to various chronic diseases, by acting chiefly on the skin. Two general causes predominate over all others in producing the majority of chronic diseases—viz., want of muscular exercise, and humidity. These causes act chiefly upon the skin; and they tend incessantly to throw back into the stream of the circulation superfluous and

excremential elements which should be eliminated from the economy; thus are induced alterations in the state of the blood, and cachexies, the cause of which was formerly unknown.

"By examining the products of perspiration during hard labour or violent exercise, we may form some estimate of the prejudicial effects of habitual inactivity upon the animal economy. After violent bodily exercise the skin is bathed in sweat, as is also the clothing in contact with it—the lactic, and soils the linen. In the passive state, the same elements (lactic acid, water, salts of various kinds, &c.) are retained in excess in the economy; men and animals become fat; the water tends to diffuse itself in the textures; the salts tend to form other combinations, and the excess of lactic acid becomes the cause of various diseases, the form and nature of which vary according to climates, localities, and the age of individuals.

"The treatment of pulmonary consumption usually terminates where it ought to have begun. Consumptive patients are sent to Italy or the South of France at a period when there is no longer hope. In this treatment, everything is interverted. Measures are directed towards the lungs when they should be directed to excite the functions of the skin." *

These observations, it will be seen, were made many years ago, but subsequent experience has tended to confirm the general justness of the author's conclusions. A high authority on the subject of climate (Sir James Clark) likewise observed on this head many years ago:—"The effect of sedentary habits is most pernicious, and there is, perhaps, no cause (not excepting hereditary predisposition) which exerts such a decided influence in the production of consumption as the privation of fresh air and free exercise. These operate as the principal causes of its greater frequency among the females of the higher classes."

Mr. Ancell, in his work on Tuberculosis, cites on this point the testimony of Dr. Gay, who found, in the close workshop of a printing establishment, that the compositors, whose employment is sedentary, fell victims to phthisis in the proportion of 74 to 100, the proportion being 31 per 100 in the pressmen, who, though breathing the same air, and in every respect subject to the same habits of life as the compositors, differ only in being engaged on the active bodily exercise of the press; and that among the same class of operatives the deaths from this cause did not exceed 25 per cent. in those who used exercise in the open air. In men following indoor occupations, the ratio is highest when there is least exertion, and lowest in employments requiring strong exertion. In the hospital for consumption at Brompton, the relative liability was found to be 63 per cent. of working in-door males, to 30 per cent. on out-door; and all the consumptive females followed in-door occupations.

It is true that in some places, characterised by dryness of the atmosphere, as in Provence, especially in Marseilles and some of the smaller towns on this coast of the Mediterranean, there is a tolerably large mortality from chronic pulmonary disease, which, though generally set down to the amount of tubercular phthisis, is not always referrible to this origin, and is produced by different causes to those already specified. At Marseilles, where there are no protecting hills, and where the influence of the sharp north-west wind, or *mistral*, is severely felt, the transitions of temperature are very great and sudden, and these acting on constitutions enfeebled by poor living, and exposure to the oppressive heat of summer, very often produce inflammatory affections of the lungs and air-passages, which terminate after repeated relapses in consumption. The same thing is seen, to a certain extent, in the general winter atmosphere of Nice; but that the disease is not attributable to the climate is proved by the circumstance, that it is mostly restricted to the poorer classes who live in the low confined streets of the old town, and are badly fed and clothed, whereas, the other classes of the population, as also the inhabitants of the neighbouring country, are in great measure exempt. This I have been able to ascertain from observation and enquiries on the spot, and I find it stated by a distinguished medical writer of the time of the first French republic, that "in Italy, and in some of our southern climates, pulmonary phthisis generally depends upon slow inflammation of the organs of respiration. In cold and damp countries slow inflammation of the lungs is of rare occurrence. Phthisis is there generally owing to other causes." * This is well seen in Egypt, which presents two different characters of climate. In Alexandria and in the Delta of the Nile, where humidity prevails, combined with warmth, the chronic form of tubercular phthisis is very common both among the natives and Europeans there residing; whereas, in Upper Egypt, where dryness (also combined with warmth) is the predominating character of the atmosphere, the disease is but rarely met with, unless among the Abyssinians who, descending from their hotter country to the valley of the Nile, are the more easily affected by the comparative coolness and the great variations of temperature to which this district is subject. In the desert, however, where those causes are not operative, the disease in the chronic form may be said to be almost unknown.

From what has been advanced we may reasonably conclude, that the most effectual way to prevent the supervention of tuberculous disease of the lungs in those who have shown a predisposition to its occurrence, and to cure it when existing, and not so far advanced as to be irremediable, is to place the patient, who may have been subjected to the predisposing causes referred to, under totally opposite climatic conditions during the more unfavourable part of the year; and this conclusion is justified by the results which have attended the judicious emigration of pulmonary invalids to more favourable winter resorts than exist in northern countries.

The efficacy of a residence in southern climatic Sanataria, says a German medical writer, is to be ascribed especially to the greater warmth of the southern winter. By removing a patient labouring under pulmonary disease to one of those southern localities a double advantage is obtained—first, the negative, that the patient escapes the injurious influences of the northern winter, whereby his lungs and constitution are afforded an opportunity of recovering; secondly, the positive and direct, arising from the frequent enjoyment of a mild and pure atmosphere, and the power of taking bodily exercise, advantageous alike to the respiration, and the nutriment of the body.

"It may be taken as a rule, that the moister the climate is, the more uniform will be the temperature, but it is, at the same time, to be observed, that the moister the air, so much the more will the cold be felt, particularly where the air is in motion, and so much the more particularly will be the variations of temperature. While, when the air is dry, neither the cold nor the variations of temperature, which in this case are certainly more considerable, are similarly felt. It is also to be observed, that the humidity of the air does not directly coincide with the frequency of rain. Frequency of rain is not necessarily connected with a moist climate. A climatic agent, to which little value is usually attached, but the importance of which, to invalids, should not be underrated, is the clearness of the sky. 'The degree of habitual clearness and brightness of the heavens,' says Humboldt (Cosmos), 'is important, not merely for the increased warming of the ground, the organic development of plants, and the ripening of fruits, but also for the sensations and entire disposition of man.' When we consider that a cloudy day depresses a healthy man, while, on the contrary, a clear day excites and enlivens his spirits, how much more is not the case with an invalid, and how important, in this instance, is the reflexion thereof upon the bodily condition. But an invalid who leaves his home on account of his health, and lives in a strange neighbourhood, and under unusual circumstances, has a very peculiar need

* Des causes generalis des maladies chroniques; specialement de la Phthisie Pulmonaire. Par le Dr. Fourcault. Paris, 1844.

* Cabanis. Rapports du Physique et du Moral de l'Homne. Section, Influence des Climats sur les Habitudes Morales.

of such external stimulus. A blue sky and bright sunshine give an additional charm to nature, and the contemplation of nature occupies, calms, and rejoices the patient. His thoughts are withdrawn from his own sufferings ; he is animated to the enjoyment of the open air, and to bodily exercise. In this respect we must regard the greater clearness of the sky, which is peculiar to southern regions, as being in itself favourable to the cure of these diseases.

"Much importance has been attached to uniformity of temperature, and it is certain that great and sudden changes act injuriously on those affected with pulmonary disease, but a moderate alternation has, for the most part, a beneficially exciting and strengthening influence on them, particularly on those who are of a weakly constitution, while too great uniformity may produce a prejudicial relaxation. We observe this often in our summer. Where an elevated temperature has prevailed during the day, a mild night and morning coolness have a peculiarly animating and refreshing effect, both on the healthy and on invalids. Alternations of temperature have no longer an injurious influence when they occur with a certain constancy and regularity."*

Experience has abundantly demonstrated of late that a too uniform temperature and state of weather is not the best adapted to procure lasting amelioration in the majority of cases of chronic pulmonary disease ; its continued action on northern constitutions, accustomed to atmospheric variations, producing, in some measure, analogous effects on them to that of a hot-house upon plants, which are unable to bear the action of the outward air. It is true that where there exists much general excitation or inflammatory action in the affected organs, then repose, as far as possible, becomes a matter of necessity, and a uniform moister climate, where the air is not agitated by winds, would be advisable ; but where such excitation does not exist, or exists only in a slight degree, as in most scrofulous or lymphatic subjects, a certain extent of atmospheric variation, as well as moderate exercise of the lungs and of the muscular system, are highly advantageous—tending to improve the general state of the constitution, and to prevent a further deposit of the morbid secretions.

Again, patients whose lungs are extensively diseased, may not unfrequently vegetate in a warm, moist, uniform climate longer than elsewhere—though even they often feel greatly relaxed by the enervating influence of such a climate ; but others less unfavourably circumstanced would, in most instances, from its prolonged action on their system, be incapacitated from encountering, without great risk and considerable discomfort, even the moderate atmospheric changes to which they must be subjected on removing from a locality possessing a similar climate.

As this is a point upon which much misapprehension has prevailed, I will subjoin the opinion of our highest authority on climate respecting it. "Long residence in a very equable climate," says Sir James Clark, "is not congenial to health, even with all the advantages of exercise in the open air ; a moderate range of temperature and of atmospheric changes seems to be necessary for the maintenance of health, and hence many invalids who derive much benefit from a temporary residence in a mild sheltered situation, do not bear as long residence in such an atmosphere without injury. Dr. Combe remarked during his residence at Madeira, "that the invalids were better when the temperature was less steady and the atmosphere more variable, than when the season was unusually mild and equable.' I have remarked the same effects resulting from a long residence in some of the more sheltered spots in our own island. Such situations form excellent residences for a time, after which the patient ceases to improve, and rather loses than gains strength. A long residence in very mild sheltered positions I regard as unsuitable to young persons predisposed to tubercular disease."

"Atmospheric vicissitudes," says a writer on the climate of Nice (Dr. Wahu), have "not so great an influence on the production of phthisis as has been supposed." Dr. Thozolan, physician to the Shah of Persia, wrote from Mianich to the President of the Council of Health for the Army—"One of the most singular facts which I have ascertained here, is the rarity of affections of the respiratory apparatus, especially phthisis, for perhaps nowhere else are the thermometrical changes greater, more needed, or of more frequent occurrence than in this country. One of the most remarkable conditions of the atmosphere of Persia, is its great dryness."* A late eminent London physician likewise observed, with respect to the effect of variations of temperature upon consumptive patients :—"We must be cautious not to carry our anxiety too far, for it is an undoubted fact, that within the limits of rational hardihood, exposure to the open air and to the vicissitudes of the atmosphere is the best safeguard against the attacks of phthisis in those who are predisposed. *It is to the effects produced upon the skin* that great part of the benefit derived from residence in a mild climate is probably attributable ; atmospheric exposure is a very important point during the winter months : in our variable climate it is inadmissible."†

(To be continued.)

* Dr. Rullmann "On the Therapeutic Influence of Southern Climatic Sanatoria." Churchill, 1861.

* The infrequency of tubercular phthisis in dry cold northern regions has been shewn. The effect of a dry air as a remedial measure even in very cold climates, where there exists in the patients a sufficient amount of reactive power—is adverted to by a non-medical writer, who says of the climate of Lower Canada: "Its winter is long and severe. In the neighbourhood of Quebec, cold is not much exceeded by that within the polar circle, but the dryness of the air is so great, that it is strongly recommended to those of comsumptive tendencies. I have seen a wonderful effect produced in the early stage of pulmonary disorders, by a removal from the damp and variable climate of Europe to the dry bracing atmosphere of Lower Canada."—*The Englishwoman in America.*

SURGICAL COMMENTARIES :

INTENDED AS A DIGEST OF THE AUTHOR'S PRINCIPLES AND PRACTICE, AS ILLUSTRATED BY THE MORE IMPORTANT SUBJECTS OF SURGERY.

By GEORGE MACILWAIN, F.R.C.S., Etc.

AUTHOR OF "MEDICINE AND SURGERY, ONE INDUCTIVE SCIENCE;" "THE UNITY OF THE BODY;" "DISEASES OF THE MUCOUS CANALS OF THE BODY;" "STRANGULATED HERNIA;" "LIFE OF ABERNETHY," AND OTHER WORKS.

NO. II.—OF THE TERMS "GENERAL HEALTH," CONSTITUTIONAL TREATMENT, AND OF THE INCONVENIENCE OF VAGUE DEFINITIONS, ETC.

THE terms "general health," "attention to the general health," "constitutional treatment," have been too vaguely employed. They have been applied to various conditions, involved various modes of proceeding, without any intelligible definition of the state of the animal economy to which they were administered, or of the precise means by which the objects proposed were to be accomplished.

It is very necessary, according to the principles which will be my object to explain, that we should have a clear view of what the terms "general health" and constitutional treatment are intended to convey.

It may be conceded that in many comparatively unimportant conditions, that kind of popular idea of the general health, is sufficient which includes as its treatment the avoidance of well-known nocentia of mind and body—the observance of simple diet, habitual temperance, and so forth, but when we have to treat serious diseases or important disturbances of mind or body, these loose generalities are of little service. We then require more clearly defined principles to guide our efforts, and, so far as I have perceived, we do not find this in the ordinary practice of physic or surgery.

The absence of this more precise definition at which I would aim, appears to me to have led to erroneous opinions, and serious errors in practice, and to have charged what is called "constitutional treatment," and, indeed, not seldom, medical treatment in general, with a kind of loose character, which, in the really philosophical sense of the term,

the medical man can neither explain, nor the patient understand.

Patients, and even professional men, have thus been often led to conclude, that a condition which is attended with no pain, in which the appetite is good, and the powers of ordinary locomotion unimpaired, is good general health. Nay, more, if there are actually present, material alterations or additions to some structure of the body, cases are not wanting, in which we are assured, both by medical attendant and the patient, that the general health is good. I hold this whole subject to be so important, that, to avoid omitting all illustration, I will mention one case. A man of education and a Member of Parliament, was brought to me by his medical attendant from a distant county, to consult me in relation to a very considerable deposition, of a very firm, somewhat hard character, between the skin and the abdominal muscles. On introducing his patient, the Surgeon informed me that he had read one of my books ; that he was an examined Fellow of the Royal College of Surgeons of England, and a Surgeon to an Hospital. He further proceeded, thus :—The general health of this gentleman, sir, is perfectly good, but he has a considerable tumour on the right side of the abdomen.

On this I requested the patient to strip, and having examined the characters and site occupied by the disease, examined the patient as to his history, state of his secretions, &c. Without detaining my reader with the details, I will at once briefly state what followed. On retiring with the surgeon into another room, I said, what could induce you to bring that patient to me. You say his general health is good ; why, sir, it seems to me that he has scarcely an organ in his body that is not diseased, or greatly disordered in its functions. The surgeon looked rather confused, said, "that he had not been prepared for so searching an examination," he certainly was "astonished at his imperfect respiration," &c. I declined prescribing, because I really knew of no medicine which was likely to be serviceable in the case, and therefore limited my remarks, to the patient, to coinciding with his intention of going to Malvern, and to such recommendations as to simple living, keeping his mind as quiet, and free from annoyance, as possible, and so forth. About a month after this I saw his death in the papers ; it was to me a case accompanied by such evidences of organic disease of the viscera, that I really had nothing to offer that seemed likely to be of service to him—the termination of his case being even in less time than I had predicted.

I am sorry to say I have seen too many instances, of which the foregoing is an example, and I cannot but think that when a man cannot, or does not, institute a "searching enquiry" into a serious case, it would be happy for him were he relieved from a responsibility which unquestionably he does not fulfil.

Some patients will tell you that their general health is good ; you institute some simple test, such as running up and down a very few stairs, when they come puffing away, and then, for the first time, inform you that they always feel distressed on mounting stairs or going up hill. Ladies will, in answer to your enquiries as to exercise, say, oh, yes, I take exercise. When? Oh, almost every day, "when I go shopping," or "when I make calls," or yes, we drive out every day. Sometimes I walk two or three miles. Do you never walk five or six miles? "Yes, sometimes in the winter in fine frosty weather," and sometimes in cool summer evenings. Do you ride on horseback? Yes. How often? Oh, that depends on so and so, &c. It comes to this, that not one person in ten takes regular exercise, who is not obliged to do it, or when some object presents itself to which exercise is an accessary.

Let us, then, now consider health under the idea that we attach to the term "condition," because, although this is a state far from what we can achieve in the treatment of *disease*, we shall most easily arrive at the principles we advocate, by beginning at that point of the subject. Every one is conversant with this fact—that no estimate can be formed of any feat which the body can perform, unless the individual is in what is called "condition." That this condition obtained, many things become not only possible, but safe and even easy, which, without such condition, are impossible ; and, further, that such as *are* possible without "condition," are not unfrequently dangerous and even fatal.

Now it is sufficiently obvious that it would be absurd to talk of getting a man into what is usually meant by "condition," who was labouring under any serious disease ; but I hope to show, in the course of these papers, that there is, in a great variety of cases, a condition relatively to the existing disease—much more approximated to the "condition" of health than is usually obtained—and that this can only be accomplished by a more careful analysis of what we mean by "general health," than the somewhat vague ideas which are usually associated with that expression? I hope also to show, in due course, that unless we have obtained the nearest practicable approach to that condition, that we have no more right philosophically to talk of a disease being incurable, because we have not cured it, than we have to say that a man cannot run a mile without being distressed by it, merely because he may not be able so to do when he is out of "condition." The whole subject is of great importance. There are not wanting abundant proofs that until we can obtain it, by some system or plan which, at least, is definite and intelligible, we shall never arrive at a clear notion of what should be understood by "constitutional treatment"—never know, in a teachable form, how to set about obtaining the maximum of "condition" of which a given case may be susceptible, and consequently not know how to obtain those successes which experience has shown it to be capable of achieving, nor what is scarcely less valuable, the real causes, in cases where our efforts are abortive. In considering the outward and visible signs of health, it is by no means a bad plan to pay attention to those signs in animals—I mean those who may be said to be wild—and to watch the gradual departures from these signs, as well as the supervention of disease as we arrive, through a variety of interferences with natural life, at domesticated animals, in which the greatest departures from natural habits occur *pari passu* with the occurrence of disease. I have gone into this matter so fully in another of my works (on Tumours) that I cannot repeat the matter here. These are, briefly—clear, clean, and healthy skin ; clean tongue ; white teeth ; inodorous, or at least inoffensive breath ; little or no fat, except where it has a special purpose, as in hybernating animals. The observant pathologist will have remarked how all these signs gradually become more or less imperfect as we approach through preserves of game, &c., up to domesticated animals, and the coincident development of diseases, in number and variety.

Now, if you look for these signs in man, you will find that some of them—very frequently all—are absent ; unless, indeed, you examine a man who has been well trained, when you will find one or more, perhaps all, reproduced. That which I intend to convey as disordered health may co-exist with entire freedom from pain, ordinary appetite for food, and the usual locomotion that may be the ordinary exercise of the patient. But it is a state in which the various functions of the body may be performed, but not healthily. I do not mean merely that the various secretions or excretions may be unnatural in quality, but that though the functions are performed, they are not equally distributed. One organ does somewhat more, another somewhat less, and so on. This is a subject of great interest and of some difficulty, as relating to "compensating functions." This I discussed more at large some years ago, and I saw that a good deal of it was delivered in lectures at the College of Physicians by former colleagues of mine, but without acknowledgment. Well, that is beside our purpose.

The readiness with which one organ undertakes the function of another is in obedience to a conservative law under which we can safely undergo a variety of changes which would be otherwise dangerous or impossible. So

much for the use of this interchange of function. But, in the absence of this interchange, although a state of freedom from danger or disease may exist for a time, yet one organ will not continue for an indefinite time to perform the function of any other without disorder, as commonly understood, or disease.

Consistently with the foregoing, a very material element in constitutional treatment, of course, is the equalization of function amongst the various organs of the body. But it may happen in a given case that this is impossible from the presence of organic disease in some one organ. By impossible, I do not mean absolutely, but relatively to our present knowledge. This is an important distinction, because in practice it, according to my experience, makes an exception to a rule. The rule being to act on the primarily affected organ, wherever discovered ; the exception being to act on organs secondarily affected, or otherwise situated, where the organ primarily affected shall have become diseased, that is, changed in structure.

In conducting an examination of a patient I think none of those points should be neglected, which I have tabulated in the book on "Tumours." I will here add a few remarks as guides thereto:—

First, then, the enquiry as to the habits of the patient ; many people have habits which are either positively or negatively injurious to health, such as luxurious living, excesses of various kind, sedentary habits, and such as are popularly known to be unwholesome ; but it should be borne in mind that many cases occur in which there is some habit involving no excess, nor in an ordinary sense unwholesome, which may be exceedingly unfitted or disturbing to the patient at this time.

It is sometimes difficult to get at these habits, from the patient being ignorant that they can do him harm, or from intentional reserve. It is, however, very desirable to let your patient tell his own story, he will often lead you to discover what your questions may fail to elicit. A gentleman, who laboured under severe indigestion, told me that he smoked three pipes every day immediately after breakfast ; he had not the slightest idea that this habit could be injurious. I asked a fine old naval officer if he ever drank spirits. Oh ! no. I thought, said I, that sailors were generally more or less fond of "grog." Oh ! yes, he said, I like a glass of grog now and then, I thought you meant raw spirits. The fact was he took a couple of glasses of rum-and-water every night on going to bed. Recently a case occurred to me where a disease has proved obstinate for years, and under various medical men. On asking the patient his habits he included, amongst others, the drinking a bottle of wine daily without appearing to have the least idea that it might be injurious. Then, there is some use in not putting leading questions, but getting a man to describe an ordinary day, such as—what time do you rise, what next, and so on ? This is all very tedious, but with all your care you will sometimes fail at first to elicit the most important facts ; of which, had I space, I could give very numerous examples.

Well, having got at your patient's habits as clearly as you can, you have next to consider in what organ this or that habit, this or that climate, or such vicissitudes as he may have undergone, will most likely have acted. This, no doubt, requires experience, and whatever knowledge your studies may have enabled you to acquire, as to the organs on which this or that injurious influence is most likely to act.

Now, although almost all disturbing influences may, under varying circumstances, disturb any organ, yet most injurious influences have a *tendency* to disturb one organ more than another. Thus, there is no organ in the body which may not be disordered by excesses in rich food, sugar, fat, alcohol, melancholy impressions, &c. ; yet, as the rule, these agencies much more frequently disturb the liver. This is a subject I have discussed somewhat fully in the "Unity of the Body," but I may be able to add a few remarks on it in a subsequent paper. In order to convey exactly what is intended by disturbance of an organ, I would submit the following :—The ultimate function of every organ is secretion. In health the excitement of this is duly proportioned to the want or the expenditure of the individual. If the excitant is in excess, the organ may relieve itself by increased secretion. If the excess be continued the organ on which it impinges will, after a time, cease to respond by any increase of secretion, and will either transfer the eliminating action or whatever other term you may prefer, by inducing action in some other organ in compensation, or become itself the seat of structural change ; in cases of a certain duration—both. This is how it happens that many kinds of food, which under habitually temperate, or even *occasional* increase, excite secretion, and are, in this way, made useful in many cases of inaction in an organ, become, in their *abuse*, certain excitants of disorder or disease. All this is in somewhat different senses true of rich food, fat, sugar, alcohol, mercury, and all substances which hold to other organs the relation which these more commonly, perhaps, evince towards the liver and other decarbonizing organs. But before we go further in this subject, there are many circumstances to be considered before we can polarize, so to speak, at the bedside the principles I am desirous to explain.

CEREBRO-SPINAL FEVER : ITS TREATMENT BY MEANS OF ICE.

By JOHN CHAPMAN, M.D., M.R.C.P.,
PHYSICIAN TO THE FARRINGDON DISPENSARY.

TOWARDS the close of an article headed "Cerebro-Spinal Fever," which appeared in the last Number of this Journal, there occurs, as the last words of a paragraph quoted from Professor Hirsch, the following statement,—"It has been proposed in some quarters to lay ice-bladders along the vertebral column ; Wunderlich justly pronounces this procedure more troublesome than useful." As I think this statement is calculated to mislead those physicians who, as yet, have had no experience of the action of ice when applied along the spine, but who, influenced by the evidence contained in the article from which the statement is quoted, may feel disposed to make trial of the "external and local use of cold" in the treatment of Cerebro-Spinal Fever, it seems to me desirable that I should at once point out in what respects Wunderlich's opinion is, and is not justifiable.

No doubt the process of covering the spine with ice-bladders, of keeping them precisely along it, and of replenishing the bladders with ice as often as their contents have melted, is very troublesome—so much so, indeed, as to be almost, if not wholly, impracticable ; and certainly sufferers from Cerebro-Spinal Fever are too restless, and too little under intellectual control, to afford any reasonable hope of practising such a method with advantage. Wunderlich is, therefore, quite correct in characterizing it as troublesome. Moreover, bladders of ice applied along the spine necessarily extend a considerable distance on each side of it, and are, therefore, likely to exercise a depressing, and not seldom injurious, influence on the system. They tend to produce a diminution, or arrest, of circulation in those parts of the posterior lobes of the lungs immediately beneath the ice-bladders, they benumb a large surface over which peripheral nerves are distributed, and while lessening the circulation in that surface, are likely, through the agency of reflex action, to cause contraction of blood-vessels in distant parts, and thus to aid in the impairment of the general circulation, the production of shivering, and those untoward conditions of the nervous system which shivering denotes. In the treatment of disease by the application of a sedative or stimulant influence on the spinal and sympathetic nervous centres, the most perfect method would be one by which the agent used should act upon those nervous centres, and upon them alone. This, however, is impossible, at least in the present state of medical science ; but it is obvious that the more nearly this mode of action can be approached the better. Hence the desirableness, in applying cold or heat along the spine, to be able to prevent it from extending far on each side, and to restrict it easily and definitely

to any special segments, when it is needful to act on them, and them only. Experience has convinced me, that in respect to width, bags varying from two inches to four and a-half, are the most suitable. Of course, the narrowest are for children, and the broadest for men, the smaller of the intervening sizes being adapted for the youth of both sexes, and the larger for women. After much thought, I have devised bags of india-rubber, which, as it seems to me, meet each of the above-named requirements: the spinal ice-bags enable the physician to restrict the ice to any particular part of the spine, and may be applied while the patient is in an upright position, or even walking about. They may be applied with very little trouble indeed, and I venture to say that had Wunderlich been acquainted with them, he would not have expressed the opinion, that the application of ice along the spine, is "more troublesome than useful."

Of course, the questions whether, as a general rule, the application of ice along the spine is likely, in any case, to be more troublesome than useful, and whether, in cases of cerebro-spinal fever, it is likely to prove beneficial, are widely different. Dr. Todd said he had tried cold over the region of the spine with great advantage in tetanus, in laryngismus, and in the convulsions of children; and though the case of tetanus which occasioned this statement proved fatal, he observed—"I have found it manifestly beneficial in diminishing the intensity of the spasms," and asserted that, as a general rule, cold has a powerful effect in what he called "depolarising the spinal cord." He had no idea, however, that it could be thus employed safely for any long time together, but, believing that "cold has a very powerful influence in diminishing both the force and frequency of the heart's action," he said to his pupils, "for this reason you must not apply it for too long a time, or over too great an extent of surface; you must watch your patient, and remove and re-apply it as his condition shall indicate." Dr. Todd did not imagine that the vaso-motor nerve centres could be influenced by cold along the spine. It was therefore impossible for him to suppose that the circulation and nutrition of parts distant from the spinal region could be increased by the application of cold in that region. As a general rule, cold properly applied along the spine does not diminish the force and frequency of the heart's action; and for a long time I was greatly puzzled in trying to understand how it came to pass that such an accurate observer as Dr. Todd made the statement quoted above. Undoubtedly, cold applied to the head, or to any considerable part of the body, *except along the spine*, will produce the effect ascribed to it by Dr. Todd; and, therefore, he may have inferred, very naturally, that the same effect will be produced by its application to the spine. He, however, asserts, as a matter of fact, that such an effect is thus produced; and I have now reason to believe that owing to the manner in which he applied the ice, he may, indeed, have observed the results he reports. Certain experiments which I have made, incline me to conclude that when a very narrow bag of ice—say one inch broad when full, is applied along the spine of an adult, it will, in some cases at least, exert a markedly depressing influence; whereas, a bag of ice four inches broad applied in the same case, will exert no such depressing influence. The facts observed by me, and tending to the conclusion just indicated, are, however, too few to justify any confident statement, but I hope they may stimulate enquiry. Meanwhile, I may say that considering the anatomical relations of the nervous structures in question, it seems to me not improbable that a very narrow column of ice will act mainly on the spinal cord, and that a broader one—say four inches broad for an adult—will, at the same time, exert a much more decisive influence than the narrow one can do on the collateral sympathetic ganglia. Now, as I believe the indirect influence of the spinal cord on the peripheral circulation, through the agency of its direct action on the elementary cells of the organism, is that of a stimulant, whereas the action of the sympathetic or vaso-motor nerve centres on the vascular system is that of a sedative, I can readily conceive that the sedative influence of cold *mainly* exerted on the spinal cord will depress the general circulation, while, if its influence be exerted with equal power over the collateral ganglia of the sympathetic it will not lessen, but rather increase both the force and volume of the peripheral blood-currents. Moreover, I can state confidently that the *relative* susceptibility to the influence of heat and cold of the spinal and sympathetic nerve centres respectively, differs greatly in different individuals, and in the same individuals at different times.

(To be continued.)

SELECTED CASES, DEMONSTRATING THE VALUE OF ELECTRICITY AS A CURATIVE AGENT.

By HARRY LOBB, M.R.C.S., L.S.A.

NO. II.—PARALYSIS FOLLOWING SCIATICA.

In my last paper, I described a case of rheumatic paralysis, and the paralysis following sciatica, or neuralgia, is very similar, and as regards the treatment, is precisely the same. The following case is interesting from the rapidity of cure:—

Mr. M., the well-known veterinary surgeon, consulted me last year for a very severe sciatica of the left leg, from which he had been suffering for three months, and for which he could get no relief, the pain of a very acute kind, darting down the sciatic nerve to the foot; he complained that he had not had two hours consecutive sleep for three months, and that he was nearly worn out with pain and fatigue. He certainly appeared much worn, and had evidently suffered much pain. He was very lame, and the leg was no use to him, as he could not bend it, or bear his weight upon it. The right leg was unaffected, and he managed to get on with this leg and a stick. He had been treated medicinally with alteratives, antacids, &c., and his diet had been properly attended to. He had also tried all the known nostrums, which friends so readily press upon the afflicted as infallible.

Considering the case to be one of pure neuralgia, requiring only the continuous voltaic current to be passed through the nerve in large quantities, to bring it back to its normal state, I at once applied a current from a Pulvermacher's 120 element battery, by applying the positive pole to the lower portion of the spine, by means of a wet conductor, and placing the foot in a basin of water brought it into the circuit with the negative pole. This current was allowed to pass for about twenty minutes, when I immediately put on two No. 0 bands, the positive pole on the lower portion of the spine, and taking a turn round the leg, the negative pole was placed beneath the sole of the foot—the bands being excited with one part vinegar to eight parts water, and retained in position by means of an elastic bandage.

Mr. M. called on me the next day, stating that he had had no pain since the application, and that he had slept the whole night. I, however, again applied the current from the battery and the bands, and as a precautionary measure, continued this for a fortnight, but he had no return of pain, and after a few applications of the interrupted electro-magnetic current, to stimulate to contraction the partially paralysed muscles, he rapidly regained the use of the limb, and in about a fortnight was perfectly well, and had quite lost his lameness.

Occasionally one sees a case of paralysis of the leg following sciatica of long standing, where the pain has ceased, perhaps, for months, or even years, and where the patient has not recovered the use of the leg. There is generally much wasting of the unused muscles, and some time is required to effect a perfect cure.

The following case came under my notice in my hospital practice, and is worthy of record:—

William Pratt, 5, Buckingham-street, Pimlico—paralysis of the right leg of two years' standing, following sciatica—has still some pain in the leg; the coldness of the limb

was remarkable; it had also wasted considerably, and it was stiff and useless.

Treatment—A Pulvermacher voltaic band to be worn from the back to the foot, wound round the leg, and retained in position by a bandage, the band to be excited every morning with one part vinegar to eight of water, and to be worn day and night. A powerful current from a Pulvermacher battery to be applied, by means of a metallic surface, to the limb direct current. This at once produced a return of circulation and warmth. By continuing the treatment for a fortnight he was quite cured, and could walk to and from the hospital with comfort and ease.

This is a remarkable case, from the length of time the patient had lost the use of the limb—namely, two years, and from the extent of the paralysis, from the wasting and peculiar coldness of the surface, as also from the rapidity of the cure. It appeared that on inducing circulation in the skin, a reflex effect had been produced upon the muscles through the cord, for a return of power was almost immediate upon a return of warmth to the surface.

I could relate fifty such cases as the above having a like result, but these two are sufficient to point out the nature of the treatment.

CÆCITIS IN AGUE,

By W. B. PEEBLES, M.B.

In the hot weather last July, a gentleman, aged 45, left off his warm inside clothing.

On the same day, after driving for several hours on an outside-car, he felt chilly, and towards evening had a loose motion of the bowels. They had acted well that morning. Next day he felt unwell. The bowels acted, but so unsatisfactorily that he took medicine the following morning. It did not operate, but some scybalæ were removed by an enema.

On the fourth morning I was telegraphed for, but did not arrive at his house till late in the evening. He was then suffering from tympanitis, eructations, vomiting, and strangury. The countenance was expressive of great anxiety; eyes sunk; tongue rough and deep-red at the edges, covered with bilious matter in the centre; skin soft, not moist; urine high-coloured; pulse weak, 72. In the right iliac fossa there was a hard swelling, painful to the touch, and pushing forward about two square inches of the surface of the abdomen slightly. There was also distressing ileus, increased, no doubt, by the presence of purgative medicine. The vomited matter was like coffee-grounds. The fact that some near relatives had died (one quite recently), when about the same age, with similar symptoms, increased the alarm which his state occasioned.

Had there been vascular turgescence, or a tolerably full habit, venesection would, I think, have been indicated, but my patient was weak and very spare, with a predominance of the nervous element.

I had the cæcal region leeched and poulticed, and directed calomel and opium, of each a grain, to be taken every hour. A comparatively easy night followed, but there was no sign of coming relief from the bowels in the morning; nor did a large basinful of soap and water, passed up through the long tube, produce any other effect than that of washing away a castor oil and turpentine enema, which had remained a considerable time in the rectum unfelt by him.

He was then placed for more than an hour in a deep hip bath, at as high a temperature as he could bear—the water being frequently renewed. On faintness coming on he was removed to bed and rubbed with the hand till an extrication of gas took place, followed by a bilious evacuation not containing any solid matter. He continued to be relieved in this way interruptedly for several hours.

During the following four days he was worried by states of nervous excitement, and rapid variations in the pulse occurred. However, the cæcal swelling, which had been blistered and dressed with mercurial ointment, was subsiding. The bowels were acting from castor-oil, and there did not appear to be anything local to account for the symptoms; but the tongue grew dark-brown at the root and centre, continuing rough and dark-red at the edges; and continuous hiccup came on, which nothing relieved. It seemed to be connected with an inordinate secretion of bile. Ice at the epigastrium and in the mouth was agreeable, but not much more. Little nourishment could be taken. Sherry negus seemed to be that most relished.

On the 11th day, he sat up a little, but was not making much progress. The pulse was irritable, sometimes up to 100. Tongue still dark-brown. Bowels free, with much flatus. Pain on pressing cæcum slight.

On the following morning, at four o'clock, the weather being sultry a window was open for air, a severe rigor came on, with chattering of the teeth and trembling of the limbs, followed by the hot and sweating stages of a well-marked ague-fit.

He was put on five-grain doses of quinine. Next morning at half-past four o'clock another, much lighter, fit occurred and none afterwards, but the hiccup, flatulence, and browness of tongue remained.

On the 15th day, a "stitch" being complained of in the cæcal region, it was again blistered. In other respects he was improving. Tongue cleaner. Some desire for food. Pulse regular, 80.

On the 18th day, though very weak, he was out in a close carriage.

On the 28th day he was able to take a journey to the sea-side, where rapid improvement took place. The cæcal swelling had disappeared, but there was evidence of false membrane. Iodide of potassium ointment was rubbed in. In a fortnight he returned to active country pursuits.

In the following November he reported the bowels as becoming sluggish. Sometime later, after exposure to a cold north wind, he awoke one morning with pain in the old spot, shivering, and sickness of stomach. The bowels acted a little, increasing the pain.

There was a dragging pain when he lay on the opposite side. He took castor oil; got into a warm bath, and commenced quinine again with good results. As he thought that the thickness of the fæcal mass was less than it should be, and that it seemed to stop in its transit, I directed a principally vegetable diet, with the view of keeping the presumed narrowing portion of the bowel open by the passage of a larger mass, at the same time helping it through with a tumbler of artificial saline mineral water every morning. He was also to give up wine, porter, &c., and take a cup of milk three times daily. I wished to have a seton over the cæcum, but he did not like that, and continued the blistering.

The treatment was satisfactory, and in February of this year he reported himself as feeling perfectly well.

May 19th.—"Felt a slight pain, with swelling of one of the bowels like a rope, as if full of wind, with heart-burn." This was after a fatiguing week, and went off soon.

This gentleman's residence is on high ground, immediately over-looking an extensive flat which, in rainy seasons, is flooded. The very hot sun of last July, in drying up this, let loose the marsh poison, where the sudden leaving off of warm clothing had prepared a victim for it. I have ascertained that in similar seasons ague was not uncommon in the locality.

PURPURIC FEVER.

By L. CLARKE, M.R.C.S.E., L.A.H., &c.

I TAKE the liberty of sending you notes of a case of "purpuric fever," which came under my observation within the past few days.

John Haskins, a fine boy, aged four years, whose parents reside at 53, Francis-street, in this city, was brought to my surgery by his mother and aunt, on Tuesday, the 2nd inst., at half-past six P.M. The child was unusually tall and strong-looking for its age, the mother stating that he scarcely ever had been sick. He had partaken of break-

fast that morning heartily, and had been playing about as usual until 10 A.M., one hour after breakfast, when he was suddenly seized with severe rigors, and complained of sick stomach and uneasiness about his chest, soon after followed by vomiting (which continued until the time he was brought to me) whenever he took a drink of water, and he partook of nothing else.

On looking at the countenance, it exhibited an expression more of weariness than stupor; he was dozy, but easily roused; the eyes were suffused; the conjunctiva not congested, and the pupils normal. Still there was great general prostration; the skin was hot and dry; pulse 125; tongue creamy. No spots of any kind on face, chest, abdomen, or back. On examining the arms, I found them pretty thickly dotted with spots varying in size from that of a snipe-shot to duck-shot. These spots were peculiar in colour, what I would describe as "dusky fawn;" no lividity or deeper tinge of any kind; their situation, too, was peculiar; they were confined to the anterior and outer surfaces of the arms in their entire length, the inner and posterior surfaces being perfectly free from discolouration of any kind.

The same description applies to the thighs and legs, the spots being similar in colour and locality.

The bowels had been confined since the previous day.

I prescribed calomel gr. iii., pulv. jalap co. gt. xvi., pulv. aromat. gr. ii., to be divided in two powders, one to be given immediately, and repeated in four hours if necessary; a mustard bath up to the abdomen, and a sinapism to the epigastrium, requesting the mother to send for me in the event of the child becoming worse.

The subsequent history of the case until death took place, in 22 hours after the rigors set in, was supplied to me by the mother. She carried out my directions in every way. The bath and sinapism seemed to have given a temporary check to the vomiting. The first powder, given at half-past seven o'clock, remained on the stomach for an hour and a-half; vomiting then returned, and continued at half-hour intervals. At eleven o'clock she gave the second powder, and at twelve o'clock it operated. At half-past twelve a slight convulsive attack occurred, confined to slight twitchings about the mouth, and spasms of the left arm. A second attack took place in an hour afterwards, in which the spasms were in the right arm, the left being undisturbed. Thus they occurred alternately, sometimes both superior extremities being engaged simultaneously, but none of the fits were of a very alarming character until three o'clock A.M., when a severe convulsive attack took place, when, to quote the mother's description, every bit of him worked for five minutes, and then his legs stiffened, and he remained quiescent for a quarter of an hour. The father was about coming for me then, but the mother observed that his eyes were insensible to light, and she said there was no use. From this until he died, at half-past eight A.M., the convulsions recurred every ten minutes or so. The father came to tell me of the death, and I requested him not to allow anything to be done to the body, until I would see it in four hours. I saw it then, when it presented the following appearances:—The expression of the countenance was calm; the colour had a lurid tinge; there were numerous small spots, of the dusky fawn colour I described as being on the arms, &c., the previous evening; there were no darker spots on the face; the pupils were dilated; the chest had a lurid colour also; the spots numerous; a good deal larger, and were of a pale livid colour, getting deeper in hue as they approached the abdomen. The abdomen was pale, livid, with numerous spots the size of small peas, muddy purple in colour; the anterior aspect of the arms a shade deeper than the chest, the spots the size of peas in places confluent, forming irregular patches, varying from two to four lines in their long measurement, by one to two, transversely the nails and first phalanges of the fingers, which were in firm spasm on the palms, were of dark purple, gradually paling as the colour ascended towards the wrist and fore-arm; the anterior aspect of the thighs and legs, presented appearances analogous to those of the arms. On turning the body over, the entire back presented a livid purple colour, the mesial line covering the spine in its entire length, being, if anything, of a blue-black colour, and the thighs and legs deep purple.

I will not be vain enough to express an opinion as to the pathology of this terrible malady, but I must express my belief that since its first invasion, the city has never been free from it, and that it is still dangerous, and in active existence.

Hospital Report.

GUY'S HOSPITAL.

A CASE OF DOUBLE NIPPLE IN A WOMAN ÆT. 40.

Under the care of Mr. THOMAS BRYANT.

Case 1.—Sarah P., æt. 40, a married woman, the mother of eight children, came under the care of Mr. Bryant on Sept. 25, 1862, for some chronic inflammation of one of her breasts, and it was during his examination that Mr. Bryant discovered a second nipple.

It was situated below the right breast, about six inches from the true nipple, in a direct line downwards. It presented all the external features of a natural nipple, without areola, and had grown since the woman had been married—indeed, the patient stated that before her marriage it had existed only as a small brown mark.

PEDUNCULATED FIBRO-CELLULAR GROWTH OF THE NIPPLE.

Case 2.—Ann S., æt. 27, came under Mr. Bryant's care at Guy's Hospital in May, 1864, for a pedunculated growth, the size of a haricot bean, growing from the extremity of the right nipple. It had existed for two years, and appeared as an outgrowth from the nipple, having the same colour and external appearances. The woman wished to have it removed, as she was about to be married. Mr. Bryant examined the growth, and found it to be made up of fibro-cellular tissue.

SEBACEOUS TUMOUR OF THE AREOLA OF THE NIPPLE.

Case 3.—Mary C., æt. 22, came under Mr. Bryant's care at Guy's Hospital, March 5, 1863, with a small tumour, the size of a nut, situated on the margin of the areola of the left nipple. It had been growing for five months. It was excised, and a good recovery followed.

PEDUNCULATED SEBACEOUS TUMOUR OF THE AREOLA.

Case 4.—Susan D., æt. 42, applied to Mr. Bryant, at Guy's Hospital, June 13, 1863, for a tumour hanging from the areola of the left nipple. It was pedunculated, and was the size of a small nut. It had existed for three and a-half years. When removed it turned out to be of a sebaceous kind.

Foreign Medical Literature.

INVESTIGATIONS RESPECTING ARTERIAL DILATATION AS A RESULT OF NERVOUS IRRITATION.

By Dr. CHRISTIAN LOVEN.

TRANSLATED FROM THE "HYGIEA" FOR NOVEMBER, 1866, P. 425.

By WILLIAM D. MOORE, M.D., Dub. et Cantab., M.R.I.A.;

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS; OF THE NORWEGIAN MEDICAL SOCIETY; AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; SECRETARY FOR SWEDEN, NORWAY, AND DENMARK, TO THE EPIDEMIOLOGICAL SOCIETY OF LONDON.

(Continued from page 29.)

After the possibility of thus explaining the increased circulation is removed, only two others remain: either the current in the penis received a fresh accession of impulsive forces, not proceeding from the heart, or the blood moves under normal pressure, and only the resistance in the course of the circulation, which impedes its entrance

into the caverns, is diminished—that is, the walls of the small arteries are relaxed.

The choice between these alternatives is in some degree rendered difficult by the fact, that precisely where the dilatation should occur to be efficient, it is not so easily demonstrable, as in other parts of the body. Eckhard justly remarks, that the trunks of the dorsal arteries of the penis are not dilated, and in fact, if the relaxation were limited to these trunks, it would have little influence in increasing the circulation through the penis, as the largest amount of resistance must be sought precisely in the smallest arterial branches. As to the correctness of this assertion we shall presently satisfy ourselves in speaking of division of the pudic nerve.

The small arteries supplying the caverns cannot, of course, be freely dissected without giving rise to a hemorrhage which obscures the whole field of operation. No other mode of investigation therefore remains than that employed on the ear by Cl. Bernard among others, to show the results of irritation and paralysis of the sympathetic.

For the point in question we must, therefore, carefully remove cut by cut of the corpora cavernosa, and especially of the corpus cavernosum urethræ, in which the current is most rapidly and powerfully altered, until we meet with small, separate, bright red streams emitted in jets. If now, after this has been done, the nervi erigentes be irritated, we soon observe that the bright red streams, squirting up to a height, yield a large quantity of blood, corresponding to that before seen on similar irritation, when only the corpora cavernosa were opened by the cut. This experiment, which invariably succeeds, shows that the flow of blood from the arteries into the caverns is not promoted by any kind of attractive force, but, on the other hand, it does not inform us how far, instead of a relaxation of the walls of the small arteries taking place, the blood may not possibly acquire some new circulating forces. To decide this latter point, I determined the pressure under which the blood in the corpus cavernosum stands at the maximum of erection ; at the same time, of course the pressure in the carotid was also measured.

The manometer, which indicated the pressure of the blood in the penis, was either introduced into one dorsal vein with the canula directed towards the root of the vein, while the other dorsal vein was closed with a ligature, or the urethra was divided behind the bone of the penis, the bladder was tied, the mucous membrane of the urethra was scarified through a considerable extent into the caverns, and the canula was tied in the opening into the urethra. In this mode I obtained the following numbers :—

Number of experiment.	Nervous irritation.	Mean pressure in penis.	Mean pressure in carotid.	Penis pressure. Carotid pressure.	Remarks.
		I.—Little Dog.			
1	On one side	46 mm.	95 mm.	0·50	Canula in the scarified urethra.
2	,,	50 ,,	112 ,,	0·45	
3	,,	30 ,,	91 ,,	0·33	
4	,,	19 ,,	51 ,,	0·36	
		II.—Medium Dog.			
1	On one side	36 mm.	95 mm.	0·38	Canula in one dorsal vein, the other closed.
2	On both sides	47 ,,	93 ,,	0·50	
3	,,	38 ,,	74 ,,	0·51	
		III.—Large Dog.			
1	On both sides	67 mm.	110 mm.	0·60	In dorsal vein, the other closed
2	,,	48 ,,	116 ,,	0·41	In dorsal vein, the other open.
3	,,	67 ,,	116 ,,	0·48	In dorsal vein, the other closed

Supported by the observations communicated respecting the erection-pressure, we may, as I believe, with perfect safety, recognise the view, which is also from analogy the most probable. According to it, nervous irritation promotes the circulation in the caverns of the penis in such a manner, that the walls of the smallest arteries are relaxed, and their bores are consequently considerably dilated by the pressure of the blood. In favour of this theory is the result of the experiment, in which, after cutting away a great part of the cavernous walls, the stream from the divided small arteries could be so distinctly increased by nervous irritation, and with the same view the fact completely harmonizes, that the pressure under which the blood stands in the erected penis, amounts, at the most, to 0·6 of that with which the blood flows in the carotid. The former of the experiments mentioned shows, that the apparent dilatation of the small arterial currents of blood, is not dependent on any kind of influence of the cavernous tissue, and the latter, that it is not necessary to have recourse to any new impelling forces, as the pressure of blood prevailing in the larger artery (the carotid), is fully sufficient to cover the forces in action in erection.

Were we to go a step further, we might consider the nervi erigentes as analogues of the cardiac branches of the vagus, and the ganglia lying along the same nerves at the root of the penis, as antitypes of the ganglia met with in the muscular structure of the heart. In making this comparison, we must, however, not forget, that it is indeed calculated to explain a number of phenomena, but that, nevertheless, no direct proof of the same can be adduced.

B.—Some remarks upon erection in the dog.

All investigators are agreed upon this, that for the production of erection, three things are necessary ; increase of the affluent, and restriction of the effluent stream of blood, and extensibility of the walls of the caverns. A few words as to the importance of each of these three conditions.

It is well-known that in the trabecular tissue organic muscular fibres are met with. These, as well as the circular fibres in the arteria dorsalis penis, are under the influence of the pudic nerve. This is proved by the following experiment. If we irritate the peripheral stumps of the divided nervi pudendi while the penis is collapsed and divided, the hæmorrhage is diminished, and the amputated margins of the corpora cavernosa become retracted. If the penis were, on the contrary, immediately before the irritation of the pudic nerve, turgid from irritation of the nervi erigentes, the hæmorrhage is first increased for some seconds, but directly thereupon completely stops. If we again direct our attention to the dorsal artery, when about to divide the pudic nerve, we shall see that the artery after the performance of this operation, increases considerably in diameter, and that the pulsation in it becomes more active ; notwithstanding which, neither erection occurs, nor is the flow of blood from the divided corpus cavernosum remarkably increased. We should thus perceive that the pudic nerve, and the formations depending on it, exhibit this influence on erection, that through the contraction of the latter, the swelling of the member is rendered impossible, inasmuch as through their action the most important afflux of blood is arrested. On the other hand, we cannot deny that every diminution in the normal tone of the pudic nerve must promote erection, as thereby some of the resistance placed in the way of the dilatation of the caverns and the afflux of the blood is weakened. It, however, remains undecided whether, as Kölliker thinks, in normal erection a reflex depression of the pudic nerve always occurs.

Eckhard has already fully put forward the importance of the nervi erigentes ; on irritation of these nerves the corpora cavernosa of the penis and urethra certainly swell, but the pressure of the blood in them, as the measurements given above show, by no means attains its highest value, and the bulb of the gland did not swell at all.

The maximum of pressure and swelling in this last-named part occurs first, when the current of blood is interrupted in the returning veins, and especially in the dorsal vein. To this object serves a muscle, first described by Houston, and whose relation to the dorsal veins is to be found represented in Eckhard's treatise. If, in the living animal, while the nerves of erection are irritated, we imitate this obstruction of the veins by applying a ligature

around them, the glans in a few moments swells to such a size, that the prepuce can no longer be drawn over it. I need not specially state that the reflux of the blood from the penis is not completely interrupted by this tying of the dorsal veins, for, as is well-known, other referent veins, described by Eckhard, also exist. These last named are, however, of very subordinate importance, of which we may satisfy ourselves by a very simple experiment. If, after having, by irritating the nerves of erection and closing the dorsal veins, produced the greatest possible swelling of the penis, we discontinue the irritation, but leave the ligature untouched, the member diminishes only very slowly ; if, on the contrary, the dorsal veins be opened, it suddenly collapses.

Reviews.

ON OVARIOTOMY. By T. Bryant, F.R.C.S. London: J. Churchill & Sons.

Mr. Bryant's series, entitled "Clinical Surgery," has received in all directions so much commendation, that we need only say that this treatise on ovariotomy is bound up as number seven of that issue to make it welcome to a large number of readers. It may, however, be considered as also independent of the other volumes, and of course complete in itself.

Mr. Bryant has operated on twenty-eight cases ; of these seventeen have recovered, and eleven died. Of the deaths, two were cases in which both ovaries were removed. Of the last of these we furnished a report at the time it was in Guy's Hospital.

The book opens with a chapter discussing whether ovariotomy is a justifiable operation. Upon this subject little need be said here. The operation has, in spite of great opposition, made its way, and is now pretty generally recognised in Great Britain. It is true that some few remain unshaken in their convictions by the brilliant success that has been achieved in this country, but the few are constantly becoming fewer, and when we think how really rapid the progress has been, we may partially understand their unwillingness to recede. Abroad there has been more opposition and less success. Let us hope that this may change. The history of the operation is next briefly and lucidly sketched, but we do not notice any new facts in this chapter, and we may therefore pass on to the very important subject of the causes of death in ovarian diseases. Mr. Bryant's book contains a very valuable contribution to our knowledge on this subject, being no less than analysis of the records of the post-mortem room at Guy's. From this source eighty-eight cases have been collected, and all the information that could be obtained about them has been tabulated by Dr. J. J. Phillips, the demonstrator, and forms the appendix to Mr. Bryant's work. Only eight of these cases are described as monocystic, fifty-six being polycystic, composite, or colloid, sixteen malignant, and eight dermoid.

As to age, death took place in four cases under the age of twenty ; in six cases between sixty and seventy ; and in two between seventy and eighty. As to duration, 75 per cent. of the cases lasted less than two years.

A very important point is brought out in reference to adhesions, which are mentioned as having been met with in sixty-six of these cases. These adhesions were differently distributed, according as treatment had been resorted to or not. Thus they were found in seventy-two per cent. of the cases that had been tapped, and in only twenty-seven per cent. of those which had not been interfered with. Here is a difference of forty-five per cent. in reference to one of the most important complications where ovariotomy is resorted to. On this, Mr. Bryant remarks :—"These facts seem to suggest that the operation of tapping cannot be regarded as very safe or expedient. It has its own risks, which should always be taken into account, having apparently been the direct cause of death in a large proportion of the cases in which it has been employed.

"They seem to indicate that it should not be undertaken in a case in which the operation of ovariotomy can be entertained, nor in any other, unless an urgent necessity exists ; for it evidently hastens the end, in not a few instances, by directly exciting peritonitis or suppuration of the cyst, or both combined."

This extract, besides the direct interest of the facts it contains, will serve as a fair specimen of Mr. Bryant's style. The whole of the book is written as tersely and clearly as this. Having said so, we return to these records of Guy's post-mortem room, to observe that nine of the cases are said to have had a communication between the cyst and the viscera. Of these, one had ulcerated into the ileum, one into the cæcum, four into the colon, and three into the rectum. It thus appears that the large intestine was the part through which the escape was effected, in eight out of nine instances. In one case the bladder was also penetrated. In one case the cyst made its way through the parieties of the abdomen.

The questions, when, and under what circumstances ovariotomy should be undertaken, are very fully discussed by Mr. Bryant. The operation is then fully described in all its details, and after this the twenty-eight cases are recorded in full. Of course, these must be studied thoroughly by those who wish to understand their merits, or derive all the benefit from the book that is possible. We may remark that Mr. Bryant appears to have frequently cut off the ligature and dropped into the abdomen, but he does not seem at present to have adopted the actual cautery for division of the pedicle, although he speaks of it with the greatest candour.

We have not space for further analysis of one of the most practical contributions to the pathology of the ovaries, that has lately appeared. The tables contributed by Dr. Phillips, of which we have given a sketch, contain a mass of information that will not fail to be appreciated, and which cannot be further abridged.

A TREATISE ON THE PRINCIPLES AND PRACTICE OF MEDICINE. By Austin Flint, M.D., Professor of Medicine in the Bellevue Hospital. Second Edition. Philadelphia : H. L. Lea. London : Trübner & Co.

The work of Dr. Flint is already so favourably known in this country, that the mere announcement of a new edition, revised by the author, is a sufficient guarantee of the value of this portly volume. We are not sure that the Americans are not far excelling us in this class of literature. They have a way of doing things thoroughly, which is seldom equalled, and, perhaps, never surpassed. So exhaustive was the first edition of Dr. Flint's treatise, that we could scarcely have expected as much revision in a new issue called for so soon. We find, for example, the chapter on Pyæmia is now completely re-written ; and, to show how every branch of medical literature has been watched by the author, we may mention that Mr. Savory's papers on this subject, in Guy's Hospital reports, have been duly consulted.

We have also new chapters on general Cerebral Paralysis, on Polyuria, and on Pertussis. It is, perhaps, curious how the omission of the last-named disease from the former edition should have occurred. It is, however, now supplied.

Another part of the work that has received additions is that which relates to Epidemic Cholera. We turned to this with considerable interest, to note Dr. Flint's conclusion respecting elimination. He is far removed from the parties to the controversy that has raged on this question, and so far is likely to be, an unprejudiced reader of both sides. He pronounces distinctly against Dr. Johnson's views, considering them to be "purely conjectural." He does not, indeed, enter very fully into the controversy. It is not, in fact, within the scope of his work to do so, but he furnishes a sufficient outline of the doctrine, and gives his own opinion of its value in the two words we have quoted.

Having discussed Dr. Snow's opinions under the head of "Causation," Dr. Flint writes thus :—"After a careful reconsideration of the question of the communicability of cholera, it seems to me that this view of the causation is rendered untenable by the considerations that have been prescribed. The occurrence of numerous cases, either simultaneously or in quick succession, at points so far removed from each other, that there could not possibly be any communication ; the rapidity with which the epidemic reaches its climax, and the brief duration of the epidemic, are facts entirely irreconcilable with the theory which attributes the diffusion of the disease exclusively to a virus contained in the excreta, or to an infectious miasm."

As to treatment, Dr. Flint believes that he has frequently succeeded in arresting this disease by means of a full opiate. He prefers a full dose of one of the salts of morphia, placed dry upon the tongue. This is the most likely to be retained, and a full dose presents the best opportunity of speedily affecting the system. A grain of either of the salts of morphia, is rarely, if ever, too much, and some risk of inducing narcotism is to be justified by the urgency of the disease. After collapse

has set in, this treatment is admitted to be not only inappropriate, but sometimes injurious. At this period Dr. Flint resorts to astringents. We shall scarcely be expected to enter into his accounts of other diseases now included in the work. Indeed, we doubt whether it is quite fair to select them, and shall therefore proceed to describe this volume a little more generally, first of all, only premising that every department is brought down to the latest date, an illustration of which we may give in the fact that thermometric observations in disease are very properly included.

The work consists of about a thousand pages of large octavo in very readable type. It is not too bulky, because the paper is of fine texture. The edges are cut, as in all books of this size they ought invariably to be, and the binding is strong—another important point for the purchaser. The arrangement adopted is simple. The first portion of the work, about 120 pages, is devoted to general pathology, and here we have excellent descriptions of all the anatomical changes in the solid parts of the body, and the various morbid conditions of the blood, as well as summaries of etiology, symptomatology, prophylaxis, and general therapeutics. Every line of this part of the book is most carefully done, and as a separate production it would rank high as an epitome of the principles of medicine. The second part, of course the larger, is devoted to the practice of medicine or special pathology. The author begins with the respiratory system, then passes on successively to the circulatory, digestive, and nervous. Then comes the genito-urinary system, and lastly, fevers and general diseases.

It is scarcely worth while to dwell upon the deviation from the order to which we are accustomed in most text-books. Suffice it to say that when we came to read Dr. Flint's treatise, we found the classification he had adopted as natural as others. Everything seemed to fall into its place in the course, and we look upon the whole, now we have gone through it, as a most satisfactory exposition of the principles and practice of modern medicine. If requested to signalise its better portions, we might be tempted to name the diseases of the respiratory and circulatory organs, the descriptions of which are most careful and accurate, and would serve as models of conciseness and completeness. At the same time, a similar commendation on the account of diseases of the brain and nervous system generally is equally deserved. The same remark is applicable to other parts, so that, as a whole, we can confidently recommend this volume to both students and practitioners. The former may make it their text-book, and the more familiar they are with it, the more easily will they pass their examinations.

The latter should, first of all, peruse it to refresh their memories, or to bring them *au courant* with the most advanced state of knowledge, and then place it on a handy shelf, that they may use it constantly as a book of reference on the many points that continually turn up in the daily routine of practice.

THE HUNTERIAN ORATION: Delivered before the Royal College of Surgeons of England, by JOHN HILTON, F.R.S., Senior Vice-President. Published by request. London: Bell & Daldy.

THE saints of the Comtist Callendar are the great men of all ages and nations. In the saint-making part of their system, the Posivtivists cannot claim originality; for there is scarcely any School, College, Hospital, or Institution which has not one or more patron-saints of this type whose memory is periodically extolled.

Among canonised surgeons, John Hunter is deservedly foremost. The privilege of framing and delivering the oration for 1867, in memory of John Hunter, was allotted to Mr. Hilton, and the result proves that it could not have fallen into better hands. Mr. Hilton has shown himself not only capable of rightly estimating the greatness of his subject, but also of appreciating the real purpose of such orations—a purpose "much higher than that of the mere laudation of Hunter." As he says, it is "to perpetuate the *mind that was in John Hunter*, as well as to honour his grand contributions towards the erection of surgery into its present scientific position; to inspire Hunter's successors with the same ardour of professional pursuit, the same unwearying industry, the same appreciation of the unalterable power of facts which enabled *him* to accomplish so much."

Treated in this spirit, this biennial tribute becomes no mere empty commemoration of the dead, but a motive stimulant to the education of the living; for we need now, as much as ever, the examples of such men as Hunter to be brought forcibly to our minds. In all departments of science we are liable to be intoxicated by past successes; there is still a tendency to forget the patient plodding which rendered those successes possible, and to be led away by enticing theory or startling paradox, if it but possess an attractive brilliancy. It must *be profitable even now* to reproduce the evidences of the wisdom which guided the Father of Scientific Surgery, who spent his years in working out, alone and under difficulties, those problems in the phenomena of life of which he first recognised the importance.

His difficulties, Mr. Hilton remarks, were defective education, the disheartening opposition of his contemporaries, and, in his latter years, the failure of his health.

A higher order of education *might* have smothered, in Hunter's case, the originality of thought which was his great characteristic; but general *instrumental* education must have been continually, and perhaps painfully, felt by one who was so constantly called on to convey to others ideas which he had originated. Mr. Hilton, indeed, quotes Hunter's own recognition of this defect, in reference to his work on Venereal Disease, where Hunter says—"I meet a committee of three gentlemen to whose correction every page is submitted."

To the neglect or ill-will of contemporaries Hunter opposed his firm faith in the truth of his own conclusions, based, as he knew them to be, upon facts—a faith which enabled *him*, as Mr. Hilton says, to show "the high-minded indifference of the philosopher to the petty assaults of ignorance." The manly, honest, but melancholic recognition of his heart disease he expresses with his habitual terseness," "my life is at the mercy of any scoundrel who chooses to put me in a passion."

The grand feature of "the mind which was in him," and that which Mr. Hilton seems most desirous to inculcate, is his compensation for defective education by indomitable perseverance in the collection of facts, his marvellous power of reading at once the meaning of the facts, and his natural perception of the inductive process, as opposed to the formation of hypotheses, by which he approached the most abstruse problems of life in the cautious and single-minded spirit of the truth-seeker. This quality of his mental bent is lucidly exemplified by a contrast between the studies of Darwin and Hunter in treating the same subjects; and Mr. Hilton shows how nearly, by this method of thought, Hunter all but trod upon several of those important generalizations, which are taught as familiar truths in the present day—truths owing their confirmation, in great measure, to the suggestions and conclusions so modestly put forth by Hunter.

Our space admits of the notice of but one more point in Hunter's scientific character to which Mr. Hilton alludes—one which we conceive to be worthy of all imitation, especially at the present time. Where he could observe facts, but was at a loss to account for them, he refrained from speculation, and left his bare observations on record for the assistance of those who might, in after times, attempt the solution of problems in which he had failed. Few people are content to do this now.

We cannot conclude our notice of Mr. Hilton's oration without applauding the plain, clear language in which he has clothed his thoughts. We note, with relief, the absence of the pedantic technicalities with which scientific men are too apt to load their writings and speeches.

It would be strange if we did not find here and there some sentence which would be the better for a little trimming. Another "revise" would probably have checked the somewhat hazy and luxuriant growth of metaphor in the passage—"How rarely have the great intellectual *luminaries* of any age had *kindred spirits* to sympathize with *their efforts*. As a rule, their *special value* has been *gauged* by succeeding generations rather than by their own."

But such criticism is trivial when weighed against the earnest appreciation of his subject, and the painstaking determination to do it justice, which Mr. Hilton evinces throughout this interesting and most valuable oration.

As a concise exemplification of the process of enquiry which conducted Hunter to his great achievements we earnestly recommend it to the notice of our readers.

CURRENT LITERATURE.

Wine and its Adulterations, by James L. Denman, is a small pamphlet, the chief object of which is to show the value of Greek wines. Mr. Denman is a great opponent of the system of adulteration which is constantly practised, and he denounces as fraudulent the "fortifying" of

wines, which is almost universal. He maintains that pure Greek wines contain sufficient alcohol without the addition of brandy, and strongly recommends a trial of them to those who like a full-bodied generous wine. The following extract shows the drift of the argument:—

"I beg my readers to remember a fact particularly worthy of notice in connection with Greek wines, viz., that until my introduction of them, no wines had ever been offered that could in any way compete, in point of intrinsic quality, with the supposed strong wines of Spain and Portugal, whose chief strength consists in added alcohol, not in vinous power. Not content with their natural strength, Port and Sherry are invariably fortified with from 10 to 25 per cent. of spirit; yet, in spite of this addition, Greek vintages will be found, upon testing both of them side by side, to possess more body, and be far better able to bear the addition of water, and their merits are best exemplified by comparison with the choicest growths of other countries. Nobody seeking what are called dry wines, would think of buying either cheap Port or Sherry, for these are invariably sweet and hot; on the other hand, no one in the habit of drinking those compounds could, at one bound, relish the pure qualities of Greek wines. Moderate as they are in price, they must be tested to be properly appreciated by the standard of the highest-priced wines. Compare, for instance, the red *Keffesia* at 20s. with Burgundy at 40s., or older Keffesia with the finest Burgundies; in the same way the white *Keffesia* with Chablis or Sauterne, the white *Patras* with Hock, the old *Thera* with Madeira or Sherry, *Santorin* with very fine old dry Port, the *Como* with fine full-bodied rich Port, the *St. Elie* with Amontillado or Montilla, and taste one with the other, with and without water."

Those interested in the discussion that has lately taken place between Dr. Carpenter and Professor King, will be glad to have their attention directed to Mr. Davidson's article entitled "Perforate and Imperforate Brachiopoda," in the *Geological Magazine*, which also contains an article by Mr. Bonney on "Glacial Action near Llandudno."

The *Journal of Botany* contains a scientific account of the hair parasite that gave rise to the sensation paragraphs on chignons.

The *Quarterly Journal of Science* gives a summary of the Sanitary Influence of Water, by Dr. Frankland. We have lately published *in extenso* Dr. Frankland's lecture on the Metropolitan Water Supply, so that our readers are well acquainted with his views.

The second number of the *Journal of Cutaneous Medicine* is signalised by a paper on the "Pathology of the Skin," from the pen of Mr. Erasmus Wilson. The editor also gives us a chapter on the "Culture of Dermatology."

The *Journal of Mental Science* supplys a lecture introductory to a course on Psychiatry at the Imperial Academy of Vienna, by Baron Mundy, M.D. We notice that at the coming annual meeting of the Medico-Psychological Association, a paper is to be read by Baron Mundy, entitled "A Comparative Examination of the Laws of Lunacy in Europe." Other papers are announced by Drs. Davey and Tuke.

SUPERIOR EDUCATION IN SPAIN, 1867.—The number of students inscribed in the ten Spanish Universities for the student year, 1867, is 10,289; 728 more than in 1866. Classed as follows:—3541, law; 2573, medicine; 1861, sciences, 1209, philosophy; 658, pharmacy; 234, notarial; and 213, theology. It is astonishing that in a country so Catholic, at least in name, as the Iberian peninsula, that this last number is so small. It is evident, on the contrary, that philosophy always flourishes there. The famous University of Salamanca has lost much of its ancient prestige, as seen in the present limited number of its students, 197 out of 10,289! On the contrary, Madrid reckons 4271; Barcelona, 1492; Valencia, 1067; Valladolid, 915; Seville, 688; Santiago, 474; Saragossa, 275; and Oviédo, 172. Salamanca has thus passed into the last rank. How fallen since the days of Gil Blas of Santillane!—*L'Union Médicale.*

WEDNESDAY, JULY 17, 1867.

MEDICAL CORPORATE REFORM.

MANY of our readers, in common with ourselves, must hail with a lively satisfaction the rapid progress of Reform at the Royal College of Surgeons of England—a Reform so greatly needed, and yet so long delayed. Arduous as was the commencement of the work (for it is hard to overcome moral inertia), it now speeds fairly, and is full of promise for the future. Men may, for a long time, be tolerant of *wrong*, or powerless to redress it, but, sooner or later, its *Nemesis* appears. Every change in the administration of Corporate bodies, made in conformity with the requirements of the time, and based upon the national principle of fair play towards all the Members which compose it, must not only be, *ipso facto*, beneficial, but tend especially to foster that deep feeling of loyalty which alone can confer on such an Institution permanent stability and power.

The Fellows of the College of Surgeons of England have set a noble example to their brethren of the College of Physicians, an example they perforce must follow, and the sooner the better for all concerned.

We last week incidentally alluded to the antiquated government machinery of this College. We have often suggested, and would now strongly urge an immediate and comprehensive measure of reform. With regard to its internal management generally, it does not behove us now to speak. The remedy for abuses rests with the large Liberal section of the Fellows—men of high honour, accomplishments, and energy. Our more immediate subject matter for the moment concerns the present method of election to the Fellowship, a method so notoriously unsatisfactory as to call for radical change. Indeed, to those who have watched the annual elections to this honour, its bestowal would appear in many instances to have been the result of caprice, or of direct favouritism, rather than that of a deliberate and impartial adjudication according to the standing of the member elected. No wonder, then, a feeling should gra-

dually gain ground in the Profession that the Fellowship is not the honest reward of Professional merit. When this belief shall have become general, both among the Profession and the public, this once coveted honour will find the level of its real worth. The College of Physicians of England may then be regarded as a Club—one of gentlemen, certainly—but not as a body using the power delegated to them for a time of dispensing the honour of the Fellowship according to the spirit of the charter. Until this time arrives, however, we must protest most strongly against the injustice done to many senior members by passing them over for years successively, and by electing their juniors in standing, and, assuredly, not their superiors in honest work.

To aspire to an honourable position in any community to which we may belong, is both natural and commendable; the honour to be gained furnishes the incentive to use becoming means for its acquirement; to seek such honour prematurely or obtrusively, would betray a coarseness, nay, an immodesty, from which every refined mind would instinctively recoil. Still, even forbearance has its proper limits, and these o'erstepped, its exercise might even admit of misconstruction. A time might arrive when it would no longer be a question of honour to be gained, but one of gross injustice to be redressed. When members are unfairly passed over year after year, they become within the College land-marks for comment, to be regarded either as the drones of the community, or, as men wanting in the moral requirements for election, while outside the Corporation, they may be unfairly supposed to be inferior to those who have been provided. This would appear to us one most pressing evil, and we have no hesitation in urging upon the Liberal section of Fellows, a more equitable adjustment of the mode of their election.

CHANGES AT THE LONDON COLLEGE OF SURGEONS.

The spirit of progress seems to have entered this Corporation much more thoroughly than had been anticipated. We have already fully commented upon the successful return of three new members to the Council, and expressed the general hopes of the Profession respecting this event. The observations we have felt called upon to make have, we believe, been generally endorsed by those who have paid attention to the subject, and even the warnings to which we have given utterance have found an echo in unexpected quarters. Thus encouraged, we shall continue our task with the same independence that has hitherto characterised our Journal. Untrammelled by any party, regardless of every clique, we seek but the general interests of the Profession, and cannot but be satisfied with the wide-spread approval that has been expressed of the course we have adopted; and so it is with all the other questions that now and again agitate our body.

Last week, the newly-elected Councillors were sworn in, and commenced their important duties. At the first meeting an Examiner had to be elected, in consequence of the first term of Mr. Kiernan's tenure of office having expired.

It was thought in many quarters that this gentleman would offer himself for re-election, but with a moderation and modesty that accords well with his scientific attainments, he declined to do so, and thus set an example of making way for others that we would gladly see more common in officials. This prudent act will be the greatest protest against future monopolists, and by it Mr. Kiernan proves himself a sincere well-wisher of the College, of which he is a distinguished ornament. Into his retirement from official life, he will carry the goodwill of the immense majority of the Fellows and Members of the College, and the consciousness of this cannot fail to be grateful to one whose scientific reputation is acknowledged to be of the very highest rank.

The successor chosen to the Examiner's Chair is Sir William Fergusson, who was the next in order below the court. Not a word need be said of such an appointment. To have passed over the name of Sir William would have been almost impossible, had it been desired to break down the system of promotion by seniority. Therefore, when his turn came, and the retiring Examiner did not offer himself for re-election, nothing remained but to install Sir William Fergusson in the position to which, years ago, he might justly have aspired.

Thus, during the present year, three new Examiners have been appointed—a fact altogether unprecedented. Well may the Reformers take hope, renew their determination to enforce all their rights, and urge the necessity of seizing so favourable an opportunity to complete their task.

And now about the Presidency. Mr. Hilton has been chosen President for the coming year. He was the Senior Vice-President, and his standing in the Profession such that this promotion also will give universal satisfaction. Mr. Hilton's fine mind commands respect in all directions, and his accomplishments cannot fail to lend lustre to the Presidential Chair—the highest dignity his College can confer upon him. The retiring President, Mr. Partridge, may feel that the good work he has begun will be carried out by his successor. For it should be known that to Mr. Partridge is due the credit of several of the improvements which have been inaugurated during his Presidency. To him, it is generally believed, we owe the innovations in the mode of conducting Examinations that have been so freely commended, such as the use of pathological specimens, the practical test of requiring Candidates to bandage and apply other

surgical apparatus, and the introduction of clinical examinations generally. We should add that Professor PARTRIDGE is an advocate for the plan of effecting some kind of union between the College of Physicians and the College of Surgeons, and above all, as chiefly affecting the Corporation over which he has so ably presided, he is prepared to try to effect some kind of communication between the Fellows of the College and the Council, so as to enable them to represent their views fully and authoritatively to those whom they elect to manage their affairs. It is in this direction that we look for real reforms. Until the whole body of Fellows —nay, until the Members also have some means of making themselves heard, little reforms in the Council and the Court of Examiners will fail to change the character of the Corporation, or convert it from a gigantic monopoly into a truly worthy representative of English Surgery. This is what it ought to be, and this is what the newly-elected dignitaries may greatly aid in making.

Notes on Current Topics.

THE EMPRESS CHARLOTTE.—The *Mémorial Diplomatique* gives a sad account of the state of the ex-Empress of Mexico, who remains in an alarming condition of prostration. It would appear that no means have been successful in rousing her attention, and that her once strong and cultivated mind is now such a wreck, that no effort has been made to impart to her the fact of her husband's sad fate. The same journal says :—

"As Dr. Illek had from the first made himself responsible for the cure of the Empress, Maximilian I., who had placed all his confidence in him, left him absolute master of the treatment to be followed. For that reason neither the Austrian family nor the Court of Brussels ventured to interfere in a matter so delicate. At the present time, the Emperor of Mexico having fallen under the murderous bullets of the Juarists, the rights of the two families will naturally be substituted for the authority of the husband. With that object, the Queen of the Belgians has left Brussels to be present at the family council assembled at Salzburg, and thence Her Majesty will proceed to Miramar."

As soon as the Princess is able to undertake a long journey, it is probable she will be taken to Lacken, where she passed her youth, and the scenery and reminiscences of which may revive her shattered mental powers.

THE HEALTH OF LONDON.—It is encouraging to find that the vital statistics of London continue favourable. For two or three weeks the mortality has been below the average. In the last weekly return of the Registrar-General, the deaths were 169 less than the estimated number. A death is reported from "purpura fever"; two from English cholera; fifty-four from diarrhœa; twenty-two from measles; nineteen from scarlatina; forty-five from typhus; and thirty-one from variola. The last figure is perhaps the one of most importance. An epidemic of small-pox in the capital of Jenner's native country says little for our estimation of his discovery, and furnishes a sad sequel to our comments on the insufficiency of the Vaccination Acts.

THE VACCINATION BILL.—This measure, to which we have devoted several brief notices, was, on Thursday last, referred to a Select Committee by the House of Lords. Such being the case at this late period of the Session, we presume it will be effectually shelved. Though we never felt enthusiastic about it, so much labour has been spent upon it that we might well have anticipated a better fate for it. Two or three earnest men might soon have given it a new shape, and by dint of successive alterations have transformed it as thoroughly as the Reform Bill has been changed since it was first introduced.

THE GRESHAM LECTURESHIP ON PHYSIC.—The Mercer's Committee have appointed Dr. Symes Thompson to be the Gresham lecturer, *vice* Dr. Powell deceased. There were several candidates for the appointment, which is worth £100 a-year, and requires the delivery of certain lectures in Latin and English every term. The leading candidate was Dr. Herbert Davies, who was last year a censor at the College of Physicians. Drs. B. W. Richardson, C. B. Radcliffe, Prosser James, Reginald Southey, Headland, and others, were also named as likely candidates for this office.

THE UNIVERSITY OF LONDON.—Another candidate put forward for this constituency is Dr. Miller. He is proposed in Liberal-Conservative interest. Mr. Lowe is also likely to receive support from the same party. We have all along expressed our desire to see a Medical Graduate elected, and in default of such a candidate, some one distinguished in science. It is impossible, however, to exclude politics from any such contest, and therefore, those who desire so to do, may at once make up their minds to disappointment. We apprehend that in time the political bias of every new University constituency, will be as well-known as that of each of the elder ones, and to bring forward a candidate of opposite views will be to court defeat. But there are medical men of all political opinions, and our desire is to see some of them in Parliament.

THE MYOGRAPH.—M. Rouget disputes the conclusions at which M. Marey has arrived from experiments with his myograph. M. Rouget is of opinion that the indulations only exist during a varying period when the excitant is not intense enough to completely contract the muscle. In proof of this he says that a strong electric current being employed there will be more of the vibrations marked when a weak current is used, but the muscular fibres will remain perfectly rigid.

CHOLERA.—From time to time news reaches us from various parts respecting this much-dreaded epidemic. In another column, we print some particulars that have been elsewhere published. Other advices have come to hand from Italy, which may well cause uneasiness; while in the Western Hemisphere the disease seems to have got a fair footing. Notwithstanding the capital state of the health of London, we cannot too often ask our sanitary authorities whether they are prepared.

THE CASE OF MR. R. T. FREEMAN.—We last week alluded to this case as one of a criminal charge against a dentist. The trial has now taken place at the Central Criminal Court, and the accused has been acquitted. Very few new facts were brought out at the trial, and the manner in which the jury returned the verdict is scarcely that we like to see. It turns out now that the accused is a qualified

medical man in general practice. The idea of his being a dentist having, no doubt, arisen from the charge made, being one of assault while under the influence of chloroform for the purpose of having some teeth extracted. The trial is one of such importance to the practitioner that we have given a full report of it in another column. It shows well the necessity that exists for medical men taking precautions to render such charges almost impossible. The servant of the accused in this case swore she was present during the whole time, and another witness deposed that the prosecutrix had told her that his cook was in the room. Had he been unable to have produced this evidence, what would the verdict have been?

THE LATE DR. MACPHERSON.—This distinguished Physician-Extraordinary to the Queen, and Inspector-General, who was to have been also President of the Madras Sanitary Association, is no more. The daily papers have published a telegram from India announcing his demise, but of course further particulars are not yet known. He has passed through a long career with great credit, and his decease will be almost universally regretted.

A PRIZE.—We learn from an advertisement, news which seems strange. No less than £2000 is offered as a prize, by a gentleman "who has lately recovered from a serious illness," for the discovery of a new method of anæsthesia, which shall be "effectual, harmless, cheap, and easy to apply." The discovery is to be made before July next year, and essays are to be sent to A. Z., care of the Secretary of the London Hospital. Some of the staff of that large charity will be the adjudicators, and with them will be associated, if possible, some of the staff of other London hospitals. Should no such discovery be made, the judges are authorized to award £1000 "for discoveries of minor importance, but yet of great service in the relief of pain." We hope that shortly the names of the adjudicators will be published, together with other details. The offer has all the appearance of being genuine, and we may hope the benevolent intentions of the proposer may be to some extent carried out.

POLICE MAGISTRATES AS EXPERTS.—Among the anomalies of our law is that which requires a police magistrate to certify a lunatic prior to his removal from a workhouse to a county asylum. Dr. Rogers, of the Strand Union, has lately been made to feel this anomaly by one of our London magistrates refusing the necessary certificate, and so compelling the Doctor to take him back to the workhouse. The guardians of the Strand Union—long notorious for their insolence to their professional adviser would, at this point, probably have been more ill-mannered than ever, had not the Commissioners in Lunacy interfered, and peremptorily ordered the patient's removal. The night before this was affected, however, the lunatic escaped through a window, at great risk of his life, and was not found for several days. Now, if the poor madman had killed himself by jumping from the window, or died of starvation during his roaming about, probably a general howl would have been set up; those amiable guardians of the "Brimstone Hotel" would have denounced their medical officer, and again expressed regret that they could not get rid of him, while the enlightened magistrate would possibly again have set himself up as an expert, and held his own opinion to be more trustworthy than that of a Doctor of Medicine.

CLERICAL M.P. FOR THE UNIVERSITY OF DUBLIN.—It is said that an influential party among the constituents of this University, who are sick of providing good retiring pensions for gentlemen of the long robe, and obeying the orders of the Government, intend to put forward a cleric at the approaching election, to fill the vacancy shortly to be caused by the elevation of Mr. Chatterton to the Irish Vice-Chancellorship. They feel that it is unjust to exclude a clergyman from the House of Commons, and will try the case by electing some resolute and determined clergyman as their representative. Report assigns to the Rev. Professor Haughton, M.D., the distinguished position of fighting this question, and he is said to be the coming man; because although he is in Holy Orders, he has no cure of souls, nor is he identified with any extreme Church party; while, on the other hand, his belonging *bonâ fide* to the Medical Profession, would necessarily secure for him large lay support. Great things would be expected from his known debating powers and decision of character, as well as from his close connection with academic education in all its details.

Parliamentary Intelligence.

HOUSE OF COMMONS.

FRIDAY, 5TH JULY.

MR. SYNAN rose to call the attention of the House to the report of August 10, 1866, of the Committee appointed to inquire into the rank, pay, and position of the Medical Officers of the army. He referred to the evidence given before the Select Committee of 1866 by Professor Longmore, Dr. Rees, and Dr. George Johnson, to show that the chance of promotion for Medical Officers in the army was so small that only inferior candidates could be expected to enter the service. At present there was a manifest deficiency in the attainments of candidates. In 1865 the candidates were almost all of the third class. During the present year the highest number of marks obtained was 1079, the maximum being 3400; and the lowest number was 146, the minimum being 1034. The Committee had made five recommendations, but only one of them, the last, had been attempted to be carried out. That related to the grant of increased pay and earlier retirement. The warrant carrying this out was dated April 1 last, and made no reference whatever to the other recommendations of the Committee or the warrant of 1858. The Medical Officers, therefore, did not know whether the warrant of 1858 was in existence, or whether it was intended to carry out the other recommendations of the Committee. The Medical Officers were satisfied with the rate of service-pay fixed, but not with the retiring-pay allowed by the warrant of April 1. After a certain period of service a Surgeon-Major was entitled to retire upon a rate of pay which should not exceed one-half of his full pay. Thus, a Surgeon-Major of twenty years' standing would be entitled to a retiring pension of 12s. a-day, while an Assistant-Surgeon who might have served thirty or forty years, would only be entitled to a retiring pension of 8s. 9d. a-day. With reference to the promotion of the Medical Officers in the army, the warrant of last April directed that they should only be promoted in order of seniority, and then not until after five years' service, the result of which order would be, according to the returns for 1861-2-3-4-5, which had been furnished to that House, that it would take forty years to make an Assistant-Surgeon a Surgeon. The returns on the same subject, which applied to her Majesty's troops in India as well as at home, embracing the last ten years, showed that it would take an Assistant-Surgeon thirty-one years to become a full Surgeon, and even then he would only be entitled to a retiring pension of 8s. 9d. a-day. The remedy proposed for this grievance

was that a time should be fixed when the Assistant-Surgeon should become a full Surgeon. The Assistant-Surgeons were also anxious that their rank should be recognised, and that they should be denominated "Junior Surgeons" instead of "Assistant-Surgeons." Another ground of complaint was that the Medical Officers in the Cavalry, who had to keep a horse, had to pay 8½d. a-day for horse forage, whereas in the infantry they were allowed 1s. 10d. a-day for the keep of their horse. The hon. gentleman pointed out that the importance to the army of good regimental surgeons could not be overrated, and quoted a remark made by Sir James Outram shortly before his death to the effect that the services of Medical Officers in the army were ill requited, and that the next great war would settle the controversy terribly in their favour. In conclusion, he moved the resolution of which he had given notice—

"That, in the opinion of this House, the alteration made in the Royal Warrant of the 1st day of October, 1858, has not only operated prejudicially to the interests of the Medical Profession, but produced an injurious effect upon the military service of the country, and that it would tend to procure a better qualified class of Medical Officers, and thereby promote the greater efficiency of the military service generally, if the recommendations of the said Committee were carried out in their integrity."

Sir J. PAKINGTON said that if the hon. Member were of opinion that the Medical Officers of the army had not been treated in a satisfactory manner, he was quite right in bringing the subject under the notice of the House. He entirely agreed with the hon. member that the army ought to have competent and well-qualified Surgeons, and it was no less essential that they should be treated in a most kind and liberal spirit. No class of persons, indeed, were more entitled to consideration than the Medical Officers of the army and navy. The question then really was, whether those officers had any fair ground of complaint. The member for Limerick seemed to think they had, and in support of this view had adverted to the warrant issued in 1858. That warrant was issued at a time when his right hon. and gallant friend the member for Huntingdonshire was Secretary for War, and he thought it would be admitted that it was conceived in a spirit of the greatest consideration and generosity towards the Medical Officers of the army. But the hon. gentleman complained that that warrant had been subsequently allowed to fall into neglect. Now, he believed the warrant was not carried out to its full extent, and the result was that evils and inconveniences arose so that a further inquiry became necessary. Accordingly in 1866 a committee was appointed, presided over by Sir A. Milne, and the hon. gentleman now complained that the recommendations of that Committee had not been carried into effect. He must say, however, that in his opinion the hon. member had somewhat overstated this part of his case. The hon. member had referred to a point on which the Medical Officers were very sensitive, viz.—their relative rank in regard to the other officers of the army, and particularly to the position which the Medical Officers occupied when called upon to assist in any boards of inquiry. The fact, however, was that the Committee recommended that when Medical Officers were engaged on such boards they should be entitled to occupy the position which their relative rank entitled them to, but at the same time it was recommended that mixed boards should not be continued. Now, whatever might be the merits or demerits of these mixed boards, he, being an unprofessional man, was unable to say; but it was at all events clear that that recommendation absolutely confirmed the rule that if Medical Officers did sit on mixed boards, they should have the benefit of their full rank. Then, as to the position of Medical Officers at the mess, the recommendation was that if they did not enjoy their full relative rank they should be allowed to hold the second place. In his judgment that met the difficulty of the case. Again, there were recommendations respecting the position which Medical Officers were to occupy in the army, and the greater part of these recommendations were acquiesced in. It was true that a recommendation that they should be restored to the classification which they formerly held had been disapproved at the Horse Guards and at the War-Office; but this was, he believed, a point of minor importance. The hon. gentleman had thought that the Medical Officers should be allowed to have chargers and to appear mounted on parade, but the fact was that the recommendation was to the effect that it should be compulsory on them to do so. It appeared, however, that this was regarded by the Medical Officers, not as a boon, but quite the reverse, and, therefore, the recommendation had not been enforced. He was surprised that the hon. gentleman should have touched so lightly on the rate of pay which the Medical Officers received, and in this respect he challenged the hon. member to say that they were not most generously and liberally treated. With few exceptions he believed that the recommendations of the Committee had been literally and in spirit carried out, and that the army Surgeons, so far as these recommendations were concerned, had no ground to complain. That there was a deficiency of candidates both for the army and the navy was unfortunately the fact; and he should be glad to make any arrangements which he consistently could make in order to render the military service more attractive.

Sir. R. ANSTRUTHER said the whole cause of the dissatisfaction existing among the Medical Officers of the army had arisen from the alteration in the warrant of October 1, 1858. Had that warrant been carried out, Parliament would not have heard a word of these complaints, and the present dearth of first-class Medical men in the army would not have been as lamentable as it now is.

The resolution was then withdrawn.

In answer to a question by Mr. PIM, in reference to the fever in the Mauritius, MI. ADDERLEY was understood to say that up to May 2 there had been 17,000 deaths, of which 10,000 had occurred at Port Louis alone, and at the date of the latest intelligence there was no abatement of the epidemic.

On Tuesday, in the House of Commons, a petition was presented by Mr. FITZPATRICK from the Irish Medical Association, praying that provision may be made in the Irish Reform Bill for a representation of the Medical Profession in Ireland.

Lord NAAS obtained leave to bring in a Bill for transferring the power of appointing the inferior officers and servants of the Irish lunatic asylums (which has hitherto been in the hands of the Government) to the local authorities, and for repealing an Act by which dangerous lunatics were confined in the different prisons of that country.

Legal Intelligence.

IMPORTANT MEDICAL TRIAL.

CENTRAL CRIMINAL COURT, JULY 12.

(Before the Recorder).

RICHARD THOMAS FREEMAN, Surgeon, surrendered under remand to take his trial upon a charge of having criminally assaulted a young woman named Mary Anne Warren.

Mr. Besley conducted the prosecution; Mr. Sleigh and Mr. Straight the defence.

The learned Counsel for the prosecution, in opening the case to the jury, described it as one of very great importance, not only to the prisoner at the bar, but also to the public, because, if the instructions furnished to him were correct, the prisoner had abused his position as a medical man, and had exercised his scientific knowledge to commit a most atrocious offence. He then proceeded to narrate the circumstances connected with the alleged misconduct of the prisoner, and said that, if the prosecutrix's evidence was to be relied on, the prisoner had deliberately administered chloroform to the prosecutrix, who had consulted him professionally, in order that he might have the oppor-

tunity of committing the act imputed to him while she was in a state of insensibility, and unable to offer any resistance.

The prosecutrix stated that she was in the service of a lady named Wheatley. She had been suffering severely from toothache, and at her mistress's request she went, about nine o'clock in the evening of the 22nd June, to the defendant's surgery, and he examined her teeth. Having done so, he requested her to come to the surgery on the following morning at eight o'clock, as he said he could see better to perform the operation at that time. She accordingly went to the prisoner's house on the following morning, and he took her into the surgery, and asked her to sit down in a low chair close to the window, and she did so. He then, without saying a word, put something to her nose and mouth, which rendered her immediately insensible. Shortly afterwards she partly recovered her consciousness, and she then found that her mouth was bleeding, and that her teeth had been removed. She then described the position she found her clothes in—mentioning several things unfit for publication in our columns. She again lost all consciousness, and on a second time recovering herself, found her mistress in the room, with whom she returned to her situation. The prosecutrix went on to say that she felt very ill and stupefied during the whole of the day on the 23rd, and on the following day she went home to her mother, and, in consequence of what she subsequently stated, a married sister accompanied her on the Thursday following to Guy's Hospital, where she underwent an examination.

In cross-examination, the prosecutrix said that the prisoner was the medical attendant of her mistress, and it was at her request that she went to him to have her teeth examined. The moment he looked at her teeth he told her that she had better have them taken out, and upon her saying that she was afraid of the pain, the prisoner told her he would take them out without giving her any pain. She was with her mistress the whole day after the occurrence, but she did not say a word to her about what had happened, or what the prisoner had done to her. When she went to her mother's on the Monday evening she met a girl named Tibbs, who asked her what made her look so ill, and she said that Dr. Freeman had drawn some of her teeth, but she did not make any complaint of Dr. Freeman having acted indecently towards her, or say that a servant was present all the time, and that the prisoner was very kind to her. She also denied having said to this person that she could not have borne the pain if chloroform had not been administered to her.

The mistress of the prosecutrix, her married sister, and Mr. Bryant (of Guy's Hospital), were then examined, the medical testimony apparently confirming her evidence most materially as to the period when the alleged offence was committed.

Mr. Sleigh made a powerful address to the jury in behalf of the prisoner, who, he said, indignantly denied the foul accusation that was made against him. Having observed upon the fearful consequences that must necessarily result to a medical man from having a charge of this description made against him, he said that the result must necessarily be that no respectable man would trust himself alone with a female patient, unless in the presence of some female relative of such patient. He then remarked upon the improbability that such an offence should be committed while the girl was literally in a state of death, and he asked the jury if they could account satisfactorily for the conduct of the prosecutrix in not having said a single word to her mistress of such a filthy act of indecency, although she was with her the whole day after it was represented to have happened, consistently with the fact of the story being true.

Mary Cook, the servant to the prisoner, was then examined. She remembered the prosecutrix coming to the house on the morning in question to have her teeth drawn. She fetched a glass of water as directed by her master, who said he should want her to assist him. He then administered chloroform to the prosecutrix, and witness held her head while he drew the prosecutrix's teeth. The witness declared in the most positive manner that she never left the room until the prosecutrix's mistress came, and that the prisoner did nothing of the kind imputed to him, and the prosecutrix made no complaint whatever.

This witness was cross-examined by the learned counsel for the prosecution, but nothing was elicited that appeared in any way to affect her testimony.

Emily Tibbs stated that she met the prosecutrix on the Monday evening as she was going to her mother's house, and she told her that Dr. Freeman had drawn two of her teeth on the previous day, and that she felt a great deal better. Witness told her that she ought to have had some one with her, and she replied that it was not necessary, as Dr. Freeman's servant was in the room all the time, and he sent for some warm water and they were very kind to her. She was talking to the prosecutrix for a quarter of an hour on this occasion, and in the course of the conversation the prosecutrix told her that she went to Brighton on Whit-Monday with her young man, and they enjoyed themselves very much. The prosecutrix had often spoken to her about her "young man," and frequently told her that he was a very fine fellow.

Mr. Sleigh, in summing up the case for the prisoner, said that if he had felt sanguine as to the result of the inquiry when he last addressed them, he was still more sanguine at that moment, after the evidence of the witnesses whom he had called for the defence. The witness, Mary Cook, was apparently a most respectable young woman, and unless she had committed the most gross and deliberate perjury, it was clear that the prisoner must be entirely innocent of the crime of which he was accused.

The Recorder, in summing up the evidence to the jury, said that if they believed the witness Mary Cook, there was, of course, an end of the case. This witness also appeared to be corroborated by the woman Tibbs, and he at the same time observed that it did certainly appear very extraordinary that the prosecutrix should not have communicated to her mistress, who appeared to have acted with so much kindness to her, what had taken place immediately, and that she should not have said anything about what she represented to have occurred until the following day.

The Jury retired at twenty minutes past three o'clock to deliberate upon their verdict.

After being in their room for more than an hour, a message was sent to the Recorder to the effect that there was no chance of their agreeing.

The Recorder, upon this, said that he was compelled to leave, but he would come down again at seven o'clock to receive the verdict.

At that hour, accordingly, the Court again assembled, and the jury were brought from their room, and the foreman stated that they had had great difficulty in arriving at a decision upon the case. The evidence was very conflicting and contradictory, and they therefore at length had decided upon giving the prisoner the benefit of the doubt, and therefore their verdict would be one of Not Guilty.

This verdict was received with considerable applause.

Since the trial, the premises of Mr. Freeman have been literally besieged by the curious, in order to obtain a glimpse of the accused, but now acquitted, Surgeon.

Examination Papers.

UNIVERSITY OF DUBLIN, TRINITY COLLEGE.

MEDICAL SCHOLARSHIP EXAMINATION.

TRINITY 1867.

ANATOMY (DESCRIPTIVE AND PHYSIOLOGICAL).

Professor M'Dowel.

1. The functions performed by the oblique muscles of the eyeball?

2. Describe the lachrymal caruncle, and mention any analogous structures.

3. What in man is the representative of the nictitating membrane of birds and reptiles?

4. The nervous supply and the mode of action of the cricothyroid muscle?

5. What are the attachments of the epiglottis?

6. Mention the origins and distribution of the following nerves:—Nervus tympanicus, greater superficial petrosal, lesser superficial petrosal, and lesser palatine nerves.

7. The relations of the trunk of the internal epigastric artery?

8. Describe the portal venous system of the kidney.

9. What nerves are found in the iliac fossa? Distinguish those superficial to, and those deeper than, the fascia iliaca.

10. Describe and contrast the intestinal glands of Brunn and Peyer.

Chemistry.—Dr. Apjohn.

1. In the British Pharmacopœia perchloride of iron is prepared by first making chloride of iron, and then converting this into perchloride; why is the latter salt not made by the more direct and speedy process of acting on metallic iron with aqua regia?

2. A solution containing chloride of iron, nitre, and hydrochloric acid, when heated evolves nitric oxide; how is such a result explained?

3. How would you convert arsenious into arsenic acid, and reduce arsenic to arsenious acid? State also how you would convert arsenious acid into arseniuretted hydrogen; and specify the reactions which ensue when this latter compound is made to pass into a solution of nitrate of silver.

4. Two liquid drachms of hydrocyanic acid, of specific gravity 0·984, when supersaturated with potass, did not give a permanent precipitate with the volumetric solution of nitrate of silver until 161·5 measures of this solution had been added; from these *data* deduce its percentage of absolute acid.

5. What is the method proposed by Schneider for separating arsenic from organic matter? When thus insulated, what is the form in which it is obtained, and what are the test experiments which you would perform upon it?

6. What amount of amylic alcohol would it be necessary to oxidate in order that, when converted into valerianate of zinc, this salt should weigh 100 grains? Specify also the theoretic quantities of oil of vitriol and bi-chromate of potash which it would be necessary to use, and the weight of the chrome alum produced in the process.

7. What amount of crystallized green vitriol would, when precipitated by ferridcyanide of potassium, yield 120 grains of Turnbull's blue?

8. How would you analyze, according to the method of Andral and Gavarret, the crassamentum of blood so as to determine the respective weights of the fibrin, the albumen, and the globules contained in it?

9. In the case of a mixed calculus, consisting of uric acid, mulberry calculus, and fusible calculus, how would you determine the amount of each?

10. Write the formula of glycerine, viewed as a triatomic alcohol, and explain how it may be insulated in the process for the preparation of litharge ointment; give, at the same time, the composition of the stearic, margaric, palmitic, and oleic acids which are produced in the saponification of fatty matters.

Botany—Dr. Dickson.

1. What is meant by a five-thirteenth leaf-arrangement? and how many vertical ranks do the leaves form here upon the stem?

2. Define the terms "perfoliate" and "connate" as applied to leaves.

3. How do the prickles on the Bramble differ from the spines on the Hawthorn?

4. How might you recognise a *leaf-like shoot*, independently of any development of leaves or buds upon it?

5. State the relative position of the micropyle to the chalaza and hilum in an *anatropal* ovule.

6. State what is meant by "ruminated" albumen, and give an example.

7. Give a plant with—

Calyx of 5 persistent sepals, produced at their bases;
Corolla dialypetalous, irregular; odd petal inferior, spurred;
Stamens 5, hypogynous, more or less synantherous; the two lower with spur-like appendages;
Fruit capsular, 1-celled, opening by 3 valves, each bearing a parietal placenta on its middle; seeds albuminous;

Name the natural order.

8. Name a natural order where the corolla is gamopetalous, and the stamens are not adherent to the tube of the corolla.

9. State as briefly as possible the differences between the orders *Boraginaceæ* and *Labiatæ* as to stem, leaves, inflorescence, carolla, and stamens.

10. State the natural order of the plant before you, and the form of inflorescence here exhibited.

Materia Medica.—Dr. Aquilla Smith.

1. How is commercial Iodine purified, and what is the chief impurity removed by the process?

2. Tartaric and citric acids, both in powder, how are they to be distinguished?

3. What drugs are produced only in Africa? Describe one of them, and state its therapeutic action and dose.

4. Give the different methods of administering Balsam of Copaiba, and write a prescription for an eight-ounce mixture of which Copaiba is the active constituent.

5. Why is fine iron wire directed to be used in making "Liquor Ferri Pernitratis"?

6. In making the preparations of Sarsaparilla, why is the Sarsaparilla directed to be "not split"?

7. What drugs and preparations are most affected by exposure to light and air, and by contact with organic matter?

8. Commercial Sulphate of Quinia may contain Salicin, Cinchonia, and Quinidia; how is the presence of these substances to be detected?

9. In making "Aqua Lauro-cerasi," give the reason for crushing the leaves, filtering the distillate, and preserving the water in a stoppered bottle.

10. Contrast the characters of Bromide of Potassium and Iodide of Potassium, and give the respective tests for the constituents of each salt.

ABSTRACT OF THE ANNUAL RERORT OF THE COMMISSIONERS FOR ADMINISTERING THE LAWS FOR RELIEF OF THE POOR IN IRELAND.

May it please your Excellency,—We, the Commissioners for administering the Laws for relief of the Poor in Ireland, submit to your Excellency this the Twentieth Annual Report of our proceedings, under the Acts in force for the Relief of the destitute Poor in Ireland.

8. Looking at the twelfth column of the same table in sucessive Reports it will be seen that, in January of the year 1864, the average weekly cost of maintenance in the workhouses in Ireland, exclusive of clothing, was 2s.; in the same column in 1865 it was 2s. 0¾d.; in 1866 it was 2s. 2d.; and in 1867 it was 2s. 5¼d. The continuous rise in the cost of provisions indicated by these comparisons, together with some improvements in the dietaries, has occasioned a material part of the increase of the relief expenditure, which will be noticed in a subsequent paragraph.

The total number of deaths in the workhouses is 12,582, in comparison with 11,622 in the corresponding fifty-two weeks of last year, or an increase of 960. But this difference is little more than the difference between the eight weeks ended 10th February, 1866, and the eight weeks ended 9th February, 1867, that is to say 900 deaths—an increase no doubt attributable

to the excessive severity of the winter season of 1867. It will afterwards appear that the deaths to 29th September, 1866, were fewer than in the previous year.

The deaths by fever in the workhouse fever hospitals have been only 981, as compared with 1258 last year ; and those by scarlatina only 70, in comparison with 134 in last year.

10. We have thus more evidence of that great diminution of mortality by small-pox which was dwelt on in the last Report, as a consequence of the very successful operation of the Compulsory Vaccination Act of 1863. In the fifty-two weeks of the period it will be seen that only 9 deaths took place from small-pox in the workhouse hospitals of Ireland, in comparison with 59 in the corresponding period of last year. In a like period in 1865 the number of deaths by small-pox in workhouse hospitals was 145 ; so that, from the time of the first operation of that Act the decline of small-pox, as treated in the workhouse fever hospitals, has been both remarkable and continuous.

The only part of Ireland for which the Registrar-General's returns furnish a means of comparison is the Dublin registration district (population 314,409), and in this district it appears that the deaths by small-pox in fifty-two weeks, ending 23rd March, 1865, were 48; while in the corresponding fifty-two weeks ending 23rd March, 1867, they were 23. In the course of the last seventeen weeks only two cases of death by small-pox have been registered, and the city of Dublin and suburbs may be said to have been for a whole year free from small-pox, except in two localities—viz., the Blackhall-street district, on the north side, and the Meath-street district on the south side of the river.

13. Another source of additional expenditure from the poor-rates has been created by the passing of the "Sanitary Act, 1866," imposing on the Guardians in all places not under the control of a municipal body, the duty of attending to the improvement of the sewerage and the removal of nuisances, in addition to that of providing special remedial measures and preventing the spread of contagion during the prevalence of epidemic disease. We have caused copies of this Act, and of all Acts or parts of Acts incorporated with it, to be printed in one volume, with a copious index for the use of the Boards of Guardians of Unions, and Committees of Management of Dispensary Districts, and have issued from time to time circulars of instruction relating to the new duties imposed upon those bodies respectively. These circulars, together with the orders under seal, issued under the provisions of the Sanitary Act, will be found in the Appendix.

14. It was not difficult to awaken the Boards of Guardians to a sense of the important character of their new functions under the Sanitary Act ; and upon the whole, a very commendable degree of activity has been shown, and many operations conducive to the health of the community have been undertaken and carried out. Similar activity, we believe, has been shown in the large cities and towns which are under the government of Town Councils ; but in the smaller class of towns, which are under the control of Town Commissioners, and over which, therefore, the Boards of Guardians possess no power, either as sewer or nuisance authority, we apprehend there has been, and still exists, in many cases, neglect.

15. The heading "Poor-law Expenditure" shows an increase of £11,342, notwithstanding that for the 12 months ending at the same date, viz., 29th September, the number of indoor recipients of relief was less by 20,062 than in 1864-65 ; while the number of outdoor recipients was more by only 1227, the total showing a decrease of 18,823 persons. The chief cause of the increased cost of relief is the enhanced price of provisions mentioned above in paragraph 8, the weekly rate of maintenance (exclusive of clothing) having advanced in one year from 2s. 2d. to 2s. 5½d.

From this it appears that the total expenditure from the poor-rates in 1865-66 exceeded the total expenditure in 1864-65 by £22,815, or, excluding the Cattle Plague Fund, by £9668. This excess is accounted for by the increased cost of in-maintenance—viz., £6183, and an increase of out-door relief to the extent of £4413. The items of decrease under Medical Charities Acts, Registration Acts, and Burial Grounds Act, are nearly balanced by an item of increase in the salaries and rations of Union Officers.

18. We have observed with much satisfaction that a sum of £59,300 is included in the Civil Service estimates for the year 1867-68 for the purpose of defraying, as in England and Scotland, part of the expense of medical salaries and medical and surgical appliances in the Irish workhouses and dispensaries. Every Irish Union has some claim to share in the benefit of this grant ; but we anticipate from it a very material improvement in the medical arrangements of the Unions on the western coasts of Ireland, to which object we trust a large proportion of the grant will be applied. We allude to districts of country of great area containing a scattered and poor population, with a (comparatively speaking) very low rental ; where, accordingly, there is little or no private practice, and where salaries sufficient to induce a sufficient number of competent practitioners to settle themselves, fall with great weight upon rateable property, already taxed for other local public purposes by poundage rates greatly exceeding those of more favoured parts of the country.

We have already, in our Ninth Annual Report, declared the medical arrangements made in some of these districts, especially the promontories and islands, to be quite inadequate, and incapable of remedy without such external assistance as the fund alluded to will, we trust, be permitted to supply.

PROCEEDINGS UNDER THE MEDICAL CHARITIES ACT, IRELAND.

19. We now submit to your Excellency the report of our proceedings under the above mentioned Acts for the past year.

The subjoined table exhibits, for each of the last five* years, ending respectively on September 30th, a summary of the relief afforded under the Medical Charities Act, in each province, and in the whole of Ireland, distinguishing the cases attended at the dispensaries from the more serious cases attended by the Medical Officers at the patients' homes.

SUMMARY OF THE NUMBER OF CASES OF MEDICAL RELIEF AFFORDED UNDER THE MEDICAL CHARITIES ACT.

Period.	Province of Ulster.		Province of Munster.		Province of Leinster.		Prov. of Connaught.		Total for Ireland.	
	Dispensary Tickets.	Visiting Tickets.	Dispensary Tickets.	Visiting Tickets.	Dispensary Tickets.	Visiting Tickets.	Dispensary Tickets.	Visiting Tickets.	Dispensary Tickets.	Visiting Tickets.
Year ended 30th Sept. 1862, .	141,679	50,611	220,009	53,248	217,078	58,363	81,690	17,501	660,456	179,723
Year ended 30th Sept. 1863, .	150,110	55,201	236,334	56,848	225,725	63,159	85,518	17,721	697,687	192,929
Year ended 30th Sept. 1864, .	148,981	58,863	230,957	60,033	223,959	61,690	87,141	17,211	691,038	197,797
Year ended 30th Sept. 1865, .	137,886	58,509	212,838	60,773	201,730	63,136	82,882	19,915	635,336	202,333
Year ended 30th Sept. 1866, .	123,510	55,252	184,780	55,651	187,585	62,321	73,687	18,011	569,562	191,235

It appears, comparing the two last years in the table, that there has been in Ulster, for the last year, a decrease in the numbers of dispensary cases amounting to 14,376, and in cases attended at the patient's homes a decrease of 3257 cases ; in Munster, a decrease of the former class of cases of 28,058 cases, and of the latter a decrease of 5122 cases ; in Leinster, a decrease of 14,145 in dispensary cases, and of 815 in domiciliary cases ; and in Connaught, a decrease of 9195 cases in the former, and of 1904 in the latter class of cases. Thus, for the whole of Ireland, there has been, for the last compared with the preceding year, a diminution in the number of cases relieved at the dispensaries of 65,774 cases, and of cases visited at the patient's homes a diminution of 11,098 cases ; giving a total of 76,872 cases. This is the largest diminution in the number of cases relieved that has taken place between two successive years since the enactment of the Medical Charities Act. It may be presumed that an improvement in the condition of the health of the poor, and the decrease in the population of Ireland, have each contributed to this result.

20. The expenditure on dispensary medical relief for each of the last five years ended September 29th, is exhibited in the next table, for each province, and for all Ireland.

* [The report gives the statistics of ten years, but we have thought it sufficient to confine attention to the five preceding the present.—Ed. M. P. & C.]

MEDICAL CHARITIES EXPENDITURE, YEARS ENDED 29TH SEPTEMBER.

Year.	Ulster.	Munster.	Leinster.	Connaught.	Total.
1862, .	£28,929	£31,991	£31,748	£14,190	£106,858
1863, .	29,676	32,269	32,663	14,598	139,206
1864, .	31,264	34,387	34,136	15,118	114,905
1865, .	31,492	34,923	34,782	15,841	117,038
1866, .	31,149	34,464	34,459	16,243	116,315

This table shows a decrease of expenditure compared with the year before, amounting to £723. In Connaught only has there been an increase, amounting to £402.

Expenses under the Medical Charities Act, year ended 29th September :—

	1865.	1866.
1. Medicines and medical appliances, . .	£21,804	£21,429
2. Rent of Dispensary buildings, . . .	7,195	7,114
3. Books, forms, stationary, printing, and advertising, ...	1,246	1,368
4. Salaries of { Medical Officers, . . .	70,343	70,605
{ Apothecaries, . . .	2,209	2,132
5. Fuel, porters, and incidental expenses, .	5,568	6,373
Expenses under Vaccination Act :—		
6. Vaccination fees and other expenses :—		
Fees to Medical Officers, . . £7,945	8,673	6,688 7,294
Other expenses, . . . 728		606
	£117,038	£116,315

Under the third and fifth heads in this table, viz., books, forms, &c., and fuel, porters, and incidental expenses, the expenditure was greater for the year ended September 29th, 1866, than for the year before by £122 and £805, respectively. Under the fourth head there has been an increase for the last year in salaries of Medical Officers of £262, and a decrease in salaries of Apothecaries of £77. Under the remaining heads last year's expenditure has been less than that of the previous year by £375 in medicines and medical appliances, by £81 in rent of dispensary buildings, by £1257 in vaccination fees to Medical Officers, and by £122 in other vaccination expenses.

The average poundage on the Poor-law Valuation of Ireland (now £12,989,026) to provide for the above-mentioned total expenditure was 2·15d. nearly, which is slightly below that of the year before, viz., 2·17d.

23. New appointments of midwives were authorised during the year in fourteen additional dispensary districts. It is the duty of the midwife, should anything out of the natural course occur in a case under her care, immediately to call for the assistance of the Medical Officer of the district, who thenceforth takes charge of the case.

24. The subjoined table exhibits the progress of vaccination of the poor in Ireland by the Dispensary Medical Officers for the five years ended September 30th, 1866 :—

	Number of Cases of Vaccination.
Year ending September 30, 1862, . . .	89,863
,, ,, 1863, . . .	106,510
,, ,, 1864, . . .	191,810
,, ,, 1865, . . .	169,142
,, ,, 1866, . . .	137,124

Although there has been a decrease in the total number of vaccinations shown in this table during the years ended September 30, 1865, and 1866, this is not to be regarded as unsatisfactory. Notwithstanding the decrease of the total number of vaccinations in these years, the vaccinations of infants falling under the operation of the compulsory Vaccination Act have been and are still increasing.

25. It appears that the total vaccinations for the last year in this table compared with the year before, are fewer by 32,018 cases ; but that the whole of this diminution has fallen upon vaccination of persons born before 1864—which class must every year diminish—while there has been an increase of vaccinations of infants coming under the operation of the Compulsory Vaccination Act for the same year of 7570 cases. The operation of this act is still, therefore, attended with success, though with less perhaps than it ought to be. We observe with much concern that in Leinster there has been a falling off in the number of infant vaccinations for the last year amounting to 785 cases. We can conceive no other cause for this than remissness on the part of some of the Boards of Guardians, in exerting the powers conferred on them by the Legislature to enforce on parents and others having the charge of infants the duty of affording them the protection of vaccination against the terrible consequences, amongst the unprotected, of an epidemic visitation of small-pox. Such an epidemic may at any time occur, and where Guardians fail to use the powers they possess to enforce vaccination they render themselves responsible for the great loss of life and other evils almost certain to take place among persons unprotected against small-pox, if exposed to its contagion. The Dispensary Medical Officers, who are nearly all Registrars of Births, &c., and as such register the birth, and also the vaccination, of every child born in their districts, are required from time to time to furnish to the Guardians lists of children whose births, but not vaccinations, are recorded in their registers, and it can be easily ascertained in any case whether the parents of those children can plead any reasonable excuse for their default ; otherwise the defaulter should be summoned before the magistrates ; and we do not doubt that the steady infliction of a fine of a few shillings in all such cases would, in a few years, secure a nearly complete vaccination of all infants within six months of birth.

The births of children registered in Ireland for the year ended March 31, 1866, were 146,990. All the children born during that year should, under the provisions of the Compulsory Vaccination Act, have been vaccinated before the 1st of October, 1866 ; and of these, probably about 130,000 were proper subjects for gratuitous vaccination at the dispensaries and vaccination stations. But the table shows that the dispensary vaccinations of infants for that year were only 104,730, and therefore (making allowance for deaths under six months) no less than 25,270 cases fewer than were required for the complete vaccination of the children of the poor born in the year in question. The corresponding deficiency for the year before was estimated at 33,840, giving a difference in favour of the last year of 8570 cases. Thus it appears that the operation of the Compulsory Vaccination Act continues, except in Leinster, progressively successful.

26. The usual record of the number of cases of scarlatina, small-pox and fever, is given. In each of these diseases there has been a smaller number of cases for this year than for the year before, viz., 6576 cases of scarlatina, 579 of small-pox, and 22,287 of fever, during the last year, against 6632 cases of scarlatina, 2000 of small-pox, and 26,566 of fever, during the year before. As regards scarlatina, the difference between the two years is inconsiderable. The cases of fever are fewer for the last than the preceding year by 4279 cases. The numbers of cases of small-pox for the two years exhibit a still greater proportional decline of that disease, and may, we think, be received in proof of a real diminution of small-pox ; although, because of the frequent concealment of it by the peasantry, when produced by itinerant inoculators, we cannot consider the numbers returned as correctly representing the numbers of cases that actually occurred among the poor in the two years.

28. Having learned that a well-marked case of Asiatic Cholera had occurred in Dublin on the 27th of July, 1866, a circular was addressed to the Dispensary Medical Officers throughout Ireland, on the 2nd of August, requesting that, in the event of any case of Asiatic Cholera occurring in a dispensary district, the Medical Officer would at once transmit to us the particulars of the case in a special report, to enable us to communicate on the subject with the Guardians. We also immediately apprized the Government of the fact that cholera had appeared in Dublin, and recommended the issue of an Order in Council putting in force over all Ireland the provisions of the Nuisances' Removal and Diseases' Prevention Act, 1848, which relate to the prevention and treatment of epidemic disease, and bestow upon us powers under that Act, so long as the Order in Council is in force, to frame and issue regulations for the same end. An Order in Council was accordingly issued on the 3rd of August by their Excellencies the Lords Justices, and such regulations as were thought primarily necessary to meet the epidemic were issued on the 6th of August. On the 7th of August, however, the Sanitary Act, 1866, having received the Royal assent, by which Act the Nuisances' Removal and Diseases' Prevention Acts of 1848 and 1849 were repealed, it became necessary to take the above-mentioned proceedings anew under the Sanitary Act, 1866. On the 17th of August the new Order of their Excellencies the Lords Justices in Council was issued under the Diseases' Prevention Act, 1855, now extended to Ireland by the Sanitary Act, 1866 ; and, under authority of these Acts and the Order in Council, new regulations were framed, prescribing at the same time the preliminary measures requisite to be taken before cholera should actually occur in any dispensary district, and also after its outbreak. In the latter event, each of the dispensary districts was constituted a district for the treatment of cholera and premonitory diarrhœa, and the Dispensary Committee of Management was to become a Sanitary Committee under the Diseases' Prevention Act, 1855. The Medical Officers of the dispensary districts were appointed Medical Officers for the

treatment of patients suffering under or threatened by cholera, without the presentation of ticket or recommendation of any kind. The Guardians were required to give public notice, where cholera or diarrhœa prevailed, of the arrangements made for the treatment of patients; and to adopt measures for the disinfection of houses in which cases had existed, and of clothing and bedding used by the patients, or likely to convey contagion; for house to house visitation; for the abatement of all nuisances which might favour the spread of the diseases; and for the speedy interment of those dead of cholera. The Guardians were directed, should cholera occur on board any ship not belonging to Her Majesty or any foreign government, and lying in any river or inland water of the Union, or at sea on the coast of the Union within the jurisdiction of the Admiralty, to deal with it under the new powers conferred by the eleventh section of the Diseases' Prevention Act, 1855, as regards inspection, disinfection, and treatment of the sick, in the same manner as if the ship were a house in their Union; and they were authorized, in respect to all expenses incurred in the disinfection of the dwellings of poor persons labouring under diarrhœa or cholera, and in the removal of nuisances, to defray them, in case of necessity, from the rates. The Sanitary Committees were directed to hold meetings weekly or oftener; and the Medical Officers were required to make weekly returns to their Committees, and daily returns to us, in prescribed forms, giving precise information as to the existing condition of the diseases in their districts.

29. Thus in any dispensary district in which the Guardians had made the preliminary arrangements prescribed by the 1st Regulation of the General Order of the 25th of August, it was in our power to put in motion the whole machinery for the treatment of the subjects of the epidemic in the most remote dispensary district in Ireland within forty-eight hours after the occurrence of the first case of cholera; or even, in consequence of an important improvement on the course followed in the epidemic of 1854, immediate steps for putting the regulations in force might be taken by the Guardians and Sanitary Committees, as soon as the disease appeared in their unions or districts, without waiting for further instructions.

30. The two first cases of Asiatic cholera in the present epidemic in Ireland occurred on the 27th of July. We have mentioned above that the first case in Dublin occurred on July 27, 1866; and on the same day the first case in Wexford occurred. In our endeavour to trace the origin of the outbreak, we have ascertained the very remarkable and significant fact, that in the following cases, viz.—in Dublin South City Dispensary District, July 27; Wexford, July 27; Dublin, North City Dispensary District, August 2; Belfast, August 9; Kilkeel, County Down, August 10; Rostrevor, County Down, August 11; Buncrana, County Donegal, August 12; Kilkelly, County Mayo, August 12; Ballylinan Dispensary District, County Kildare, August 14; Dunlavin Dispensary District, County Wicklow, August 14; Drogheda, August 14; Roscommon Dispensary District, September 6; and Mountmelick, Queen's County, September 6; the patients had in every instance just arrived in the respective localities from Liverpool, where cholera at the time was rife.

In some other cases there was clear evidence of the importation of the disease. Thus, in Arklow, where the disease, having regard to the population, has been on this occasion perhaps more severe than in any other town in Ireland, it was brought (August 30) by two sailors just arrived from on board the schooner *Crystal Palace*, lying in the Liffey, from which a sailor had been removed in cholera on the Tuesday before. In the town of Wicklow the first case occurred in a person just arrived (October 16) from on board the *Olive*, lying at Kingstown, in which the disease existed. In the village of Cloughey, County Down, the disease was imported (October 20) from Balbriggan, where cholera then prevailed, by a sailor, who died of the disease. Another sailor from the same boat died of cholera in the next village, on October 21, and the disease quickly spread in the neighbourhood. The first case of cholera in Newbridge, Naas Union, occurred in the person of a cattle-dealer, who had just arrived from Manchester. He became ill on August 15, and died on the evening of the next day. In the first case, in Killyon Dispensary District, Parsonstown Union, the patient had returned from England two days before. He died after ten hours' illness. In Youghal the disease was imported by a sailor just arrived from Cardiff (August 20); and in Baronstown Dispensary District, Dundalk Union, the subject of the first case of the disease was a labourer, who returned from the North of England, on Friday, August 10. He was taken ill on the next day with diarrhœa. On Sunday evening cholera was fully developed, and after a short rally, he died on the next Wednesday.

In eleven of the twenty localities some particulars of the first cases occurring in which we have just given, the disease immediately spread, with more or less severity. In the remaining instances no second case occurred.

31. A striking instance of the communication of the disease by contagion was afforded by the first case in Dublin. The girl, Jane Magee, by whom the disease was imported from Liverpool, was one of four occupants of a room in the house No. 22, City-quay. This girl died in thirteen hours after the distinct establishment of cholera. Mary Anne Meyler, aged three years, cousin of Jane Magee, the second case, became ill on July the 30th, and died after about seventeen hours' illness. The father of this child, Christopher Meyler, the third case, aged 35, was seized at an early hour on August 1st, having been the day before in perfect health, and died after fifteen hours' illness. The last occupant of the room, widow of Christopher Meyler, became ill in the evening of the 1st of August, was removed to Sir Patrick Dun's Hospital, and died there on the 5th of August. Another remarkable case of the same kind was reported by Dr. Whistler, Medical Officer of the Bray and Rathmichael Dispensary District. Charles Ryan, a comfortable farmer, living in a very healthful situation about a mile from Bray, came into that town on December 10th, 1866, cholera being very prevalent there at the time. He was not a temperate man, and indulged freely in drink on this occasion. On his return home he was attacked the same evening with the usual symptoms of cholera, and died on the eight day of his illness. On the 13th Catherine Molloy, a healthy, active young woman, servant in the family, but not in actual attendance on Ryan, was seized with cholera, and died after thirty-eight hours' illness. On the 15th a sister of Ryan, a robust, healthy woman, sickened and died after sixteen hours' illness; and on the 18th a boy, grand-nephew to Ryan, resident in the house, fell ill, and died on the third day of illness. The family consisted of six persons, four of whom died of the disease within ten days.

32. In many instances, on the other hand, it was found impossible to establish any connexion between the first case occurring in a new locality and any other, or any place in which the disease prevailed. We will adduce two remarkable instances of this. As has been stated above, cholera first appeared in Ireland, in the present epidemic, in Dublin and Wexford, on the 27th of July. On the 22nd of August it broke out, with a virulence for a short time very alarming, in Westport, county Mayo, quite on the other side of Ireland. Within a few days 22 cases with 13 deaths occurred, and in a short time the disease became extinct, and has not hitherto recurred. Diligent enquiry failed to connect any of these cases with any other case of the same disease, or with any infected locality.

The second instance alluded to occurred among the male prisoners in the Mountjoy Convict Prison, Dublin, and was a very remarkable instance of the apparently spontaneous origin of Asiatic cholera.

It is scarcely within our province to enter on the details of this case, the institution being under the superintendence of another department; but we may be permitted to state shortly that under the most favourable conditions of situation, air, water, food, and sewerage, the disease in a virulent form shewed itself on the male side of the establishment, numbering 280 inmates, but not on the female side, where there were 400. On 23rd Dec. and four following days nine cases of cholera occurred, of which four were fatal. Simultaneously with five cases of cholera which broke out on the first day, 64 cases occurred of diarrhœa, all of which yielded to prompt treatment.

It is remarkable that this took place after cholera had ceased in every other part of Dublin and the suburbs, and when no communication could have taken place between persons in the prison and persons in any locality in which cholera was at that time prevailing.

34. From the beginning of September the disease slowly but steadily spread westwards till towards the end of last January, when the returns of cases from the Dispensary Medical Officers had become very few; and then, for some weeks it appeared to be extinct. New cases, however, have recently occurred at Whitegate, a village on Cork harbour; and soon after a few scattered cases were reported by Dispensary Medical Officers at Tullamore, Navan, Kells, Oldcastle, and Belfast. At the present date we are happy in being able to report to your Excellency, that for some time past no case of cholera has been reported to us from any part of Ireland.

35. Up to December 31st, 1866, when the disease was approaching extinction, as we have mentioned, there had been reported by the Dispensary Medical Officers, 3119 cases, with 1256 deaths in Leinster; 541 cases with 229 deaths in Munster; 87 cases with 32 deaths in Ulster; and 59 cases with 38 deaths in Connaught, giving totals for Ireland of 3,806 cases and 1555 deaths. The cases and deaths in hospitals provided by the Guardians for cholera patients; and the cases and deaths in the hospitals supported by Parliamentary Grant, and other hospitals in the City of Dublin, amounted to 1389 cases and 753 deaths. The total cases of cholera in Ireland, excluding 886 of the above-mentioned dispensary cases which were sent to hospital, and are also included in the hospital returns, was 4309, resulting in 2308 deaths, which, compared with 5570 cases, and 2606 deaths in 1854, gives a percentage mortality of 46·8 in 1854, and 53·6 in 1867. The above cases are exclusive of those arising in private practice, and of cases sent to hospital otherwise than at the expense of the Poor Rate.

36. Dealing separately with those portions of the above statistics which relate to the City of Dublin, exclusive of the suburbs, we find that there were in the recent outbreak 1825 cases of cholera, resulting in 755 deaths of persons treated at the expense of the Unions. That is to say, in the City Dispensary Districts, 1183 cases, resulting in 370 deaths, and in the hospitals, 642 cases, resulting in 385 deaths. There were also treated in the two Dispensary Districts of the City of Dublin 6921 cases of diarrhœa, resulting in 61 deaths. The total number of dispensary cases of diarrhœa treated throughout Ireland during this epidemic was 25,100, with 340 deaths, in comparison with 27,423 cases with 279 deaths in 1854.

38. The recent application of this system of medical relief to the English Metropolitan District was partly recommended on the ground of its extreme usefulness on such occasions, as will appear from the following passage in the Report of Mr. Lambert, the English Inspector sent over to Ireland to inquire into the operation of the Irish Dispensary system, with a view of seeing whether it might not be advantageously applied to the London Unions:—

"It provides," he says, "an organisation always ready and capable of expansion, if necessary, to meet any outbreak of epidemic disease with promptness, while at the same time it is calculated to prevent disease becoming epidemic, and procuring the adoption of precautionary measures in any locality which may be threatened. These benefits have recently been largely realized in Ireland in reference to cholera."

The same view was dwelt upon by the President of the English Poor-law Board in moving the first reading of the Metropolitan Poor-law Bill in the House of Commons.

39. It is right to mention that we have resorted to the exercise of the recently-enacted power of enforcing adequate remuneration to the Medical Officers for extra service under the cholera order, in only one instance—viz., that of the North Dublin Union, having in all other cases found ourselves able to approve the amount voted by the Board of Guardians, or where we did not approve, to induce the Guardians finally to adopt our views.

DEPARTMENTAL ARRANGEMENTS.

The passing of "The Sanitary Act, 1866," has entailed upon the four Medical Inspectors an increase of official duty, under the provisions of the Sewage Utilization Acts, the Nuisances' Removal Acts, and the Acts for the Prevention of Disease, so far as the same are applicable to Ireland. Most of these duties are, to say the least, as capable of being efficiently discharged by the lay as by the Medical Inspectors; and it is impossible for these officers to decline to take part in the business arising under these Acts on their attendance at Boards of Guardians when the latter are desirous of obtaining their advice and assistance. The legal powers of inquiry possessed by Poor-law Inspectors are, however, limited to questions arising under the Poor-law Acts; and much waste of service is caused by having one and the same district subject to two Inspectors possessed of different powers and functions, and traversing the same roads in performance of different duties. We therefore feel called upon to repeat a recommendation already made by us in 1857, to the effect that every Inspector, whether lay or Medical, should have powers of inquiry extending to every description of business which is under the superintendence and authority of this Commission. In the hope of obtaining this [illegible]nent, we have forborne to press for any increase of the number of Inspectors.—We have the honour to be, your Excellency's obedient, faithful servants,

A. Power.
Naas.
Thos. A. Larcom.
J. M'Donnell, M.D.
R. M. Bellew.

Correspondence.

THE BI-LATERAL OPERATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In the announcement of two operations of lithotomy performed successfully by Sir William Fergusson according to the Celsian method, in the last number of The Medical Press and Circular, it is stated "that Sir William considers the lunated incision to afford greater facilities for the extraction of the calculus, and incurs less danger of wounding the rectum. It would be desirable to know the age and other circumstances connected with these patients, and also whether there was a bi-lateral section of the neck of the bladder.

It is probably not known to the majority of your surgical readers that this bi-lateral operation was habitually performed by Dupuytren, who employed a double slightly-curved *bistouri cache*, and that it was also adopted in many cases by some other Parisian surgeon. The cases, however, to which a preference might be accorded to it over other operations for stone require discrimination. In my Jacksonian prize essay "On the Comparative Advantages of Lithotomy and Lithotrity," I recorded the statistics of this operation as performed by Dupuytren, from which it resulted that in most of the cases occurring in children and youngish subjects, it was less successful than the lateral operation, and that it seemed to be more adapted to cases in advanced life, where the calculus was larger and the prostate gland enlarged, the incision on both sides affording a greater space for the extraction, without its going much beyond the limits of the prostate, and thus obviating the urinary infiltration of the cellular texture, which an extensive one-sided incision would be almost sure to produce in similar cases, and to be followed by a fatal result. The lateral operation, thus discriminately employed, might be advantageously adopted in this country.—Your obedient servant, Edwin Lee.

TREATMENT OF AGUE BY HEAT TO THE SPINE

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Dr. Chapman's comment on my letter of the 5th ult. is full of interest, and I for one think he is deserving of all praise for his talent in developing the science of the Profession.

Regarding his treatment of cholera, I think we may mutually assist each other. There is an old adage that "extremes meet." It will give me great pleasure in making Dr. Chapman's acquaintance, therefore I shall make myself known to him privately, for the purpose of comparing notes in any case of ague or cholera that may come under treatment. I think this will be advantageous to us both, possibly to the Profession at large ultimately.—Yours truly,

M.D., M.R.C.P.London.

A PLEA FOR OPIUM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—One cannot too much admire the descriptions of the so-called cerebro-spinal meningitis which we get from Ireland—a faithful portrayal of the most frightful of disorders—but it is sad to see the little disposition there is to trust in the results of experience. The only remedy which has proved of service in this complaint seems wholly neglected. I mean opium, the controlling action of which, on the disease, was first brought to the notice of the profession by M. Chauffard, as a result of his experience in the military hospital at Avignon in the epidemic of the years 1840-1. This physician was a disciple of Broussais, and little liable to yield to any evidence but of the most positive kind. Moreover, the history of these epidemics is in print, and alluded to in our compendiums of physic. I may shortly say that the whole bias of the profession in France was in favour of this practice. None more than the French were aware of the inadequacy of the term meningitis to characterise the epidemical affection. Among others M. Boudin insisted on the low type of the fever, the petechiæ,

and purple stains, *les tâches pourprées et même noires.* In the epidemics on the Spanish Peninsula the treatment recommended by M. Chauffard alone met with approbation; and hence my attention was first drawn to the subject. In the spotted fever of America enormous doses of opium have been given without producing sopor, and it was generally approved. Philip Woodman has the credit of being the first Englishman who described this complaint, under the head of a malignant fever with a coagulation of the blood *(i.e.*, increase of fibrine). This author strongly recommends the use of opium, especially where there are spots, and to "abate the fury of the nervous disorder," he denounces the use of purges, vomits, and, with slight exception, of glysters. Let the timid read Brachet, 1828, *Memoire sur l'emploi de l'Opium*, a most scrupulous writer, and see how fully he concedes the use of opium in arachnitis and cephalalgia apart from this question. I fear to weaken this plea for an old remedy by additional remarks, but my mind being long turned towards this subject I would direct attention to the second of Dr. Hayden's cases (MEDICAL PRESS AND CIRCULAR, June 5th, p. 531), as giving an insight into the *genesis* of this disorder. Abroad it has happened that cavalry regiments have been exclusively attacked, while at the same time the infantry were exempt; country villages when the towns escaped. If we are to look to positive causes in the production of such disease we may conjecture that the dung of horses and cattle undergoes a change which makes it infecting. The connection of this meningitis with cholera is probable, the same was commented on by M. Levy in the epidemic of Val de Grace, 1848, occurring between two cholera years. We seem, indeed, to return to the views of physicians in the fourteenth century, who have affirmed that pestilence is general in its influence, and that its character is not wholly comprised in a particular manifestation of disease.—I am, sir, yours faithfully, GEORGE GASKOIN, M.R.C.S.E.

ARMY MEDICAL DEPARTMENT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me to call the attention of your readers to a statement of Sir John Pakington's, made in reply to Mr. Synan's motion of the 5th inst., on promotion in the Army Medical Department. Sir John says "he did not believe that any gentleman would remain thirty years an Assistant-Surgeon *if* he were worth promoting." Sir John should have remembered that the little word "if" proved Mr. Synan's case, promotion being, as the rule, by seniority, not merit; the boon coming to the evil as to the good.

Mr. Synan deserves the gratitude of the department, for his advocacy of their cause, and it is pleasant to find so kindly a feeling existing towards the Profession, on the part of the Secretary at War; however, the want of promotion requires the most serious consideration of all about to enter the service. —I remain, your obedient servant, M.D.

ELECTION OF COUNCIL OF ROYAL COLLEGE OF SURGEONS (IRELAND).

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your editorial remarks on the recent election of Council of Royal Colleges of Surgeons, published June 19, 1867, I find the following remark:—

"We venture to declare that the Metropolitan Fellows have not only declared, but proved, their desire for the assistance of their provincial brethren."

Allow me, through your columns, to suggest to the New Council a simple mode whereby *they can prove their desire* for provincial assistance:

Apply for, and obtain, a new charter, or have the present one so amended as to enable Fellows not resident in Dublin to vote in all College matters by proxy, and for election of Councillors by voting papers.—I am, &c.

THOS. H. BABINGTON, M.D.

SOCIETY FOR THE RELIEF OF POOR-LAW MEDICAL OFFICERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The perusal of Mr. Denis Phelan's two last papers in your journal, in reference to a certain annual provision for the widows and children of Irish Poor-law Medical Officers as have inadequate means of support, has given me the greatest pleasure. I think that the whole profession should second Mr. Phelan's efforts to make some provision for our widows and children. I will be only too delighted to join a movement of the kind, and I am sure that very few of the Medical Officers attached to Workhouses and Dispensaries throughout Ireland will refuse to subscribe to a fund, when raised for this good purpose.

Let the Irish Medical Association take the matter in hands without delay, and I have no doubt they will confer a benefit on our profession which will always be remembered with gratitude.

The great desire which Mr. Denis Phelan has evinced on this occasion, as well as on many others, to improve the condition of our profession is worthy of all praise. I have no doubt, if the advice which he has given to the profession is taken, that it will not only redound to his honour, and be a lasting tribute to his memory; it will also elevate the profession by making it self-dependent, and take away a public reproach which has been attached to our ranks too long, viz., that we do not unite for self-preservation.—I remain, yours truly,

M. C. BERNARD.

Gleanings.

THE GOVERNMENT OF BUENOS AYRES AND THE CHOLERA.—Dr. Furst fell a victim during the epidemic. As an acknowledgment of his services, the Government of the province has undertaken his funeral expenses, and it has granted a pension of six hundred francs a month, for ten years, to his orphan children, besides the expenses of their education. —*L'Union Médicale d'Etoile Belge.*

MORTALITY OF BACHELORS.—Mothers of daughters in Scotland should hang up, in as conspicuous a position as possible, the late report of the Registrar-General of Births, Deaths, and Marriages. At every period of life, from legal infancy to second childhood, the bachelors die long before the married men. There is something quite pathetic in the mere statistics representing so many persons relegated to the silent tomb in consequence of being unable or unwilling to sustain existence with a wife. It is dangerous, however, to consider longevity as a proof of happiness. Asthmatic people will gasp through scores of years. It may be said they do not live long because of the asthma, but in spite of it. No one, however, should think of applying such an instance to the married subjects of the figures above mentioned.—*London Review.*

FUNERAL OF SIR WILLIAM LAWRENCE, BART.—The remains of this distinguished Surgeon were interred on Thursday last, in Ealing churchyard, by the side of those of his late wife. In pursuance of the wishes of the deceased, the funeral was as simple as possible. The only representative who attended from the Council of the College of Surgeons, with which institution he was so long connected, was Mr. John Flint Lant. It is still more extraordinary to relate that, from so large an Hospital as St. Bartholomew's, only Mr. Callender attended. Mr. Mitchell Henry and Dr. Tweedie were the only other members of the Profession.—*Times and Gazette.*

FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.—We understand that at the last meeting of the Faculty, Dr. Alexander Bryson, C.B., Licentiate of the Faculty, 1825, Director-General of the Medical Department of the Navy, &c., was unanimously elected an Honorary Fellow. This is an honour which the Faculty very rarely confer, and, in this instance, while graceful in them, it must be gratifying to Dr. Bryson to receive such a recognition of his public services, and of the high Professional position to which he has attained.—*North British Daily Mail.*

PROFESSIONAL TRADES' UNIONS.—An otherwise esteemed correspondent has forwarded to us the following minutes of evidence alleged to have been taken before a private Commission of Investigation, with the view of establishing that the system of coercion, intimidation, and persecution practised by trades' unions is in full force in the learned and liberal professions, and that it is unjust to indulge in sweeping condemnations of these societies among working men while the higher classes set them such a bad example. It is hardly necessary for us to point out that there can be no possible analogy between the rules made by knife-grinders and bricklayers and the laws of etiquette formed for regulating the affairs of officers and gentlemen, but we publish the evidence for what

it is worth, leaving it to our readers to form their own conclusions:—Sir Charles Verulam, Bart., M.D., examined—"Am a Member of the College of Physicians. Have been in practice upwards of thirty years. Am thoroughly acquainted with professional etiquette. Believe there is nothing like it. Have known a good many members 'rattened.' They were not 'rattened' for inexperience or immoral conduct. There offence was always a breach of etiquette. Knew Dr. Pullen well. Had a hand in getting him 'rattened.' He had undertaken a midwifery case. Consider such conduct disgraceful. Don't know why he did such a thing. Never heard that it was done to save life. Don't think that that would justify a physician in doing accoucheur's work. Remember the case of Colonel Johnson. He was seized with an apoplectic fit while travelling with his friend, Sir Harry Holcombe, the Court Physician; bleeding would have saved him, but Sir Harry declined to use a lancet, and the colonel died. Consider Sir Harry acted like a gentleman. See nothing unchristian or inhuman in adhering to etiquette. Do not consider the Colonel was murdered. Would certainly have 'rattened' Sir Harry if he had used a lancet. Have no compunction in expelling a member who breaks the rules. Don't think poverty any excuse for taking less than the established fee. Would certainly 'ratten' any member who took half a guinea. Never took less than a guinea myself, except once from the Marquis of Pimlico, who slipped a shilling into my hand instead of a sovereign. Did not find it out before he had gone. Don't think it was done on purpose. Don't know what becomes of members after they are expelled. Have known them practise in defiance of the rules. Consider such conduct immoral. Have heard of general practitioners. Don't remember ever seeing one. Don't wish to see one."—*Examiner.*

CLINICAL PRIZE ESSAY ON DISEASES OF THE SKIN.—We are informed that Mr. Hutchinson offers this year, as a clinical prize to the students of the London Hospital and those of the London Hospital for Diseases of the Skin, a well-bound and complete copy of "Wilson's Portraits of Diseases of the Skin," value £14, 14s.—*Times and Gazette.*

WE are glad to learn that the Institution of Civil Engineers, London, have awarded Mr. Edward Byrne, C.E., the Telford Medal and the Telford Prize of Books for his paper "On the Action of Charcoal in Removing the Organic and Inorganic Matters from Spring and River Waters," which was read before the Institution this session. Mr. Byrne conducted the investigation in the laboratory of the Museum of Irish Industry.—*Saunders' News Letter.*

Medical News.

ELECTION OF EXAMINERS—Queen's University, Ireland.—At a meeting of the Senate, held in Dublin Castle, on the 13th inst., the following, among other University Examiners, were elected:—

Medicine.—B. G. M'Dowell, M.D., Professor of Anatomy, Dublin University, Physician to the House of Industry Hospitals, and Surgeon to Sir Patrick Dun's Hospital; in succession to R. D. Lyons, M.B., Professor of Medicine in the Roman Catholic University, Physician to the House of Industry Hospitals, and to Maynooth College.

Surgery.—M. H. Stapleton, M.B., Examiner, R.C.S.I., Surgeon to the Mater Misericordiæ and Jervis-street Hospitals; in succession to Robert M'Donnell, M.D., F.R.S., the distinguished Physiologist.

Midwifery.—John A. Byrne, M.B., Professor of Midwifery in the Roman Catholic University, and Medical Officer to Grand Canal-street Dispensary District, South Dublin Union; in succession to L. Atthill, M.D., Registrar of the College of Physicians, and formerly Assistant-Physician to the Rotundo Lying-in Hospital.

Materia Medica and Medical Jurisprudence.—Francis B. Quinlan, M.D., Professor of Materia Medica in the Roman Catholic University, Medical Adviser to St. Vincent's Hospital, and Surgeon to the Government Convict Prison; in succession to W. D. Moore, M.D., the distinguished Translator and Editor of Medical Works in the Norse languages.

ROYAL HOSPITAL FOR INCURABLES.—Last week the foundation stone of the new wing to this valuable charity was laid in the presence of a goodly number of spectators and friends of the Institution by Lady Elcho—to whom the Treasurer, Mr. Henry Huth, expressed, in an appropriate speech, the pleasure and gratitude they all felt at the interest her ladyship had taken in the welfare of those for whom the benefits of the institution were intended. Lady Elcho then adverted to the claims of those who, through some dire calamity sought admission to the hospital, not perhaps to be cured, but at least to receive all the comforts that skill could devise, and concluded a most telling and sympathetic speech by declaring the foundation stone duly laid.

A BOY, eight years of age, about to undergo the operation for strabismus, died at the Manchester Eye Infirmary from the effects of chloroform.

THE *South London Press* says that Earl Spencer, as lord of the Manor of Wandsworth, has undertaken to lay out the common as a public recreation ground on the termination of the present legal proceedings.

THE DISEASES PREVENTION ACT.—A second supplement to the *London Gazette* of Friday, contains various orders of the Privy Council, relative to the Acts for the Prevention of Diseases. They continue in force for another six calendar months the Diseases Prevention Act, 1855, and the relative Act, 23rd and 24th Victoria, cap. 77, specify regulations for boards of guardians and vestries as to what shall be done when cholera is in a union, parish, or district, and renew for six months an order of January 10, 1867, relative to vessels infected with dangerous or infectious diseases.

CHOLERA.—A correspondent of the *Times*, at Malta, communicates the following respecting cholera:—"The official bulletins of the cholera in Sicily show that the disease is still on the increase, especially in the provinces of Girgenti and Caltanisetta. From the 11th of June to the 19th there were 3801 attacks and 1558 deaths in Girgenti; 1407 attacks and 586 deaths in Caltanisetta; and 23 attacks and 14 deaths in Mazzara. Later news by telegraph says that the epidemic is still raging. The distress is very great, and requisitions have been made by the authorities at Girgenti to the Italian Consul here for supplies of flour and block ice." The following is an extract of a letter from Tunis, dated the 26th of June:—"On the first breaking out of the cholera here this year it showed a tendency to spread in the town; but lately it has remained stationary as regards the number of cases in the town itself. About ten Europeans have died from it here, some of the attacks terminating fatally in a few hours. At the Goletta, the port of Tunis, however, the cases have been more numerous in proportion to the population, and along the whole coast of the Regency, especially at Susa, the disease has been very severe. At Susa the French vice-consul and another European were among the victims. The Bardo, a residence of the Bey of Tunis, and the Manuda, a country district in which are situated the villas of the Chief Tunisian families, have as yet escaped from the pestilence, as they have indeed always escaped in previous visitations." The alarm in Barbary is very great, and threatens to show itself in an exodus like that from Alexandria in 1865. Already the Lazzaretto at Malta is full to overflowing, although Government has intimated that owing to the very limited accommodation it affords, only British subjects, and none beyond a certain number, will be received. The Maltese population have caught the alarm, and, knowing too well from the past and sad experience the danger of admitting into the island crowds of refugees from cholera-infested countries, even if the Lazzaretto were large enough to hold them, have represented through the elected members of council, and by petition the necessity of immediate and energetic measures being taken to check the evil, and they also pray the Government to enforce a more rigorous system of quarantine in regard to those persons already in the Lazzaretto. The petitioners go so far as to beg the Government to prohibit the admission of all emigrants from Barbary and Sicily, and such places where cholera is raging, pointing out the fact that in 1865 it was only by rejecting all arrivals from infected countries that Sicily was preserved from cholera, and that the disease was also kept out of Tunis by the very strict quarantine regulations adopted by the Tunisian Government. The example of Greece, which we believe has enjoyed immunity from cholera on every occasion that it has visited Europe, might also be quoted as strong corroborative evidence in favour of the efficacy of strict precautionary measures. In the meanwhile the quarantine at Malta has been increased from 15 days to 21 days on arrivals from Manfredonia, round Calabria Ultra, as far as the Gulf of Salerno; and a quarantine of 21 days has been established on arrivals from Naples and neighbouring ports, as also from the east coast of Algeria, between Philippeville and the boundaries of the province of Tunis.

Original Communications.

CASE OF OLD STANDING DISLOCATION OF THE HUMERUS.

REDUCTION ELEVEN WEEKS AFTER THE OCCURRENCE OF THE ACCIDENT.

(Read before the Ulster Medical Society.)

By W. MAC CORMAC, M.A., M.D., F.R.C.S.I.;
SURGEON, BELFAST GENERAL HOSPITAL.

THE following cases are, I conceive, of sufficient moment to interest the members of the society. I do not, therefore, consider any apology needful in respect of bringing them forward.

The particulars of the first case I have abridged from notes most carefully taken at the time by one of my clinical clerks, Mr. Joseph Smyth, and are as follows :—

George Johnston, 34 years of age, a bricklayer's labourer, was admitted under my care into the General Hospital, Belfast, November 22, 1866.

He gave the following account of how he had met with the accident. Nine weeks since, while "drunk and disorderly," he had fallen into the hands of the police. Considerable violence was required in order to effect his arrest. During the struggle he either fell or was thrown down, and it was then, he believes, that he sustained the injury. His hands were subsequently manacled behind his back, but the pain which this occasioned became so excessive as to necessitate their release.

On the following day, Sunday, as he was suffering very much, his friends thought it expedient to procure medical advice. He was, however, directed merely to stupe the parts with warm water, the nature of the injury, apparently, not having been recognised. Next day the magistrate sentenced him to sixty days' imprisonment. Whilst in gaol, the attention of the surgeon, it appears, was not drawn to the condition of the shoulder. A few days after his time had expired, the man finding himself unable to work, applied to me, and I advised him to go into hospital, which he gladly consented to do.

On examination, the patient was found to be labouring under dislocation of the right humerus, beneath the coracoid process of the scapula, the "infra-coracoid" dislocation of Malgaigne. The acromion process was very prominent, whilst the shoulder had become much flattened, not only from displacement of the head of the bone, but from the atrophy of the deltoid muscles which had ensued. On careful admeasurement, the affected limb was found shortened only one eighth of an inch, while the vertical circumference of the axilla and acromion was increased two inches, a sign first pointed out, and looked upon as a pathognomonic by Mr. Callender. The fore-arm was in a state of semi-pronation, the arm being directed somewhat backwards, and also slightly abducted. The head of the bone could be felt in the axilla when the arm was raised, but not otherwise. Obscure crepitus, pointed out by Sir Astley Cooper as simulating fracture, could readily be detected by rotating the head of the humerus in its new position.

Although considerable power of motion had been acquired, so much so that the man, whilst in gaol, could pick oakum, and even rake the walks, he could not elevate his injured arm without the assistance of the other arm, while the effort occasioned much suffering. He could touch his lips with his fingers, but he could not convey food to his mouth. He had, indeed, to feed himself with the left hand. In short, the limb had become useless to him for the purposes of earning his bread.

On Saturday, the 24th November, precisely ten weeks since the accident had occurred, the man was placed fully under the influence of chloroform, and forcible reduction attempted by means of the pulleys. Extension and counter extension were gradually made, and kept up for a considerable time, with no other effect than breaking down, more or less completely, the new adhesions formed by the head of the bone. The direction of the traction was obliquely downwards and outwards. While the patient was still in an unresisting condition, and the muscles were quite flaccid, before the effects of the chloroform had passed off, White, or La Mothe's plan was tried—the arm being pulled almost directly upwards, the shoulder being depressed by the foot planted firmly against it. The heel was also tried in the axilla. On the 27th, no inflammation or evil effects having followed the previous trial, another effort was made, lasting about half-an-hour, and also under chloroform. Extension was tried in a downward direction, and afterwards manipulation was had recourse to, one hand grasping the head of the bone, whilst the other rotated the arm inwards. The most patient efforts, in this and other ways, obtained no better results than on the previous occasion, and the attempt had, perforce, to be abandoned.

I now almost decided, seeing the risk apt to be incurred from applying so much force, to make no further trial. But an examination of the man's arm, with its almost useless condition, the great and continuous pain which he suffered, especially on trying to raise it, induced me again to make a trial.

Knowing the difficulty of these cases to reside mainly in not employing adequate counter-extension, and sufficiently fixing the scapula, I adopted a suggestion which I owe to Professor Tanner of Cork. It consists in moulding accurately a gutta-percha shield, with a hole in the centre for the arm to protrude, over the back, front, and side of the chest, and round the root of the neck. By this means, the scapula and clavicle were very firmly fixed, and a large surface was available over which to distribute the power employed. The shield was now carefully padded with cotton wool, and re-applied, a sheet passed round it, the arm attached to pulleys above the elbow, and traction so managed as to draw the arm at right angles to the trunk. The fore-arm itself was flexed at a right angle, as well as carefully bandaged. Chloroform having been administered, the pulleys were gradually brought into action for some ten minutes, the humerus at the same time being alternately rotated inwards and outwards. It was then found that the head of the bone had shifted its position externally for fully half-an-inch, and was disengaged from beneath the coracoid, while the adhesions were felt to give way. I now executed the following manœuvre, by means of which I fortunately succeeded in replacing the bone in the glenoid cavity. Firmly depressing the shoulder with my hand, I pulled the neck of the humerus in the opposite direction, by a strap passing round it and over my neck. I requested my colleague, Dr. Murney, who kindly and ably assisted me, to rotate the limb inwards, forcibly at a given moment. All these preparations having been completed, word was given to let go the pulleys. These were slackened in an instant, when it was found that the head of the bone was in its place. Thus, by means of this combined movement, an old standing dislocation, which had resisted our utmost efforts on two previous occasions, was reduced exactly seventy-seven days after its occurrence.

The shield of gutta-percha was now cut off, while the elbow was kept fixed to the side, and retained there by bandages subsequently sewed together. The skin, which had previously been much abraded by the sheet, was this time unruffled, having been thoroughly protected by the gutta-percha, and that too, notwithstanding the much greater additional force employed. Although the bone was in its place, the prominence of the head, anteriorly, was so marked, as almost to make one fear it could not be so. The muscles around the joint were quite atrophied, causing undue projection of the acromion and spine of the scapula. Nine days after, the bandages were removed, and the patient was allowed to move his arm in a forward direction, as well as to rotate it inwards, but he was enjoined not to exercise it by the reverse movements.

On the 13th I made measurements of the shoulder, and found that the difference of the vertical circumference of the joints had become reduced from two inches to three-quarters

of an inch. The transverse diameter of the injured side, taken with callipers, was still one-eighth of an inch greater than the other.

Ten days after, though the man was enjoined to use his arm, and though passive motion was employed daily by myself, I found, on examination, that there was little movement of the arm independent of the scapula, to which it seemed anchylosed. Any attempt forcibly to break down the adhesions, except under chloroform, would have occasioned great pain. The patient, therefore, was put under the influence of the anæsthetic, and having caused my assistants to fix the scapula with their hands, I steadied the head of the bone with my left hand, while I raised the humerus to rather more than a right angle with the other. It was easy both to hear and feel the adhesions giving way, which they did with a peculiar tearing, crackling sound. No inconvenience followed, some temporary soreness excepted, while the additional freedom of action acquired was very considerable.

Before the man had left the Hospital, Jan. 25, 1867, he could readily swing the heavy poker of the ward round his head, stretch both hands equally high against the wall, and perform a number of other feats, which showed that he was rapidly regaining the full power of the extremity. Some months after his discharge, I saw him returning from work carrying a bucket in one hand, and a shovel in the other. He stated that he was always getting more and more command over his arm, and that it was now nearly as useful to him as ever.

Such cases are, in many respects, of great practical importance, and I purposely detained Johnston somewhat longer in hospital than was absolutely necessary, in order that the students might thereby benefit accordingly. In the first place, when the man came under my notice he was quite unaware of the nature of the injury which he had sustained, and his principle complaint was of pain in the neighbourhood of the elbow and fore-arm. He complained of no pain whatever in the shoulder, but only that it was stiff. A short time since, indeed, a carpenter was admitted to hospital with a dislocation of the humerus, which he had believed was a strain, and had treated with liniment conformably ; and it was not until nearly a fortnight had elapsed that, finding himself getting no better, he consulted a medical man. Such instances should ensure the exercise of caution in similar circumstances. Great swelling of the soft parts may, and sometimes does, render the symptoms in the event of such injuries obscure; and Hamilton, of New York, mentions two cases in which New York Hospital Surgeons, only a few hours after the receipt of the accident, had failed, from this cause, to ascertain the nature of the injury. In one of these cases reduction was effected by Dr. Hamilton on the seventh, and in the other on the tenth day.

Although, in Johnston's instance, the dislocation was reduced only a week short of the time fixed by Sir Astley Cooper, as the limit beyond which no attempts should be made, many cases are on record where reduction has been accomplished after much longer periods. It should, however, be remembered that such trials are attended with great risk. Rupture of the axillary artery has but too frequently taken place, and in one instance the nerves of the brachial plexus were actually torn out by the roots. At the same time injurious or fatal results are by no means customarily or uniformly made known.

The force employed on the third trial was simply enormous, and it was all required to pull the bone from beneath the coracoid, and tear up the abnormal adhesions. Its application proved as safe as it was effectual, owing to the equable manner in which the pressure was distributed, and the complete way in which the scapula was fixed by the gutta-percha shield. The principle is the same as that of Sir Astley Cooper's split sheet, but it is vastly more efficient. To its employment, indeed, I feel, to a large extent, indebted for the satisfactory issue of the case.

The after progress of the patient was all that could be desired, and the rapid way in which he regained power of motion in the extremity, after such long disuse, was much facilitated by breaking down forcibly the spurious anchylosis between the scapula and humerus, and by the persistent daily employment of passive motion.

In conclusion, I would observe that the forward projection of the head of the bone gradually but not altogether subsided. It is, indeed, important to be aware of this not uncommon occurrence, after reduction of old standing luxations, a circumstance which Hamilton states, has frequently led to charges of malpraxis sometimes successfully, though most unjustly, sustained.

PYÆMIA, WITH EXTENSIVE LESIONS SUPERVENING UPON INJURY OF THE HEAD—DEATH.

The following history serves to show that the body will sometimes be invaded by disease of a most extensive character, and yet the signs of its presence prove very obscure. It presents, as well, some features of medico-legal interest :—

Thomas Gamble, 14 years old, a mill-worker, came under my care in hospital on December 17th. Four days previously, while leaving his work, he was struck on the forehead by another boy with a heavy iron bar some two feet long, inflicting a wound on the forehead, and at the same time knocking him down. The house-surgeon dressed the wound, and recommended the lad to remain in hospital, as the pericranium had been stripped off and the bone was laid bare. This, however, the boy at the time refused to do.

When he did seek admission, a vertical wound was found almost in the centre of the forehead, unhealthy looking, and secreting a considerable quantity of pus. The boy complained of headache, but there was no urgent symptom whatever about the case otherwise.

On the 19th his condition seemed much improved. The wound looked more healthy, and the headache was less.

On the 21st he first complained of his chest. He was annoyed by a short tickling cough, and the sputa were rusty coloured. A stethoscopic examination revealed marked dulness posteriorly over the lower part of the left lung. On the same side in front and above there were great resonance on percussion, and puerile respiration. In the upper part of the right lung well-marked bronchitic râles were heard. He was ordered suitable medicine, and a nourishing diet. Two days after, the 23rd, the chest symptoms became very urgent. The boy's condition was that of a person prostrated with typhoid pneumonia. He was so weak, with a pulse at 125, and hurried, laboured respiration, that it was impossible to make a satisfactory examination. My colleague, Dr. Smith, saw the patient with me on the 25th, and we came to the conclusion that there was evidence of general bronchitis and pneumonia of the lower lobe of the left lung. I need not detail the progress downwards of Gamble's case. He became daily worse and weaker in spite of the most stimulant treatment. He was perfectly sensible and conscious up to his decease. There was no evidence of grave mischief, or any mischief at all, going on within the head, save the headache, which was persistent. He did not even wander in his sleep until the last few nights, and, though very weak, answered any questions put to him in a perfectly collected manner, even when I last saw him alive, on New Year's Eve. He died on the morning of the 1st January, 1867. A post-mortem examination was made fifty-two hours afterwards. The wound was quite unhealed, and its edges blackened from decomposition. On removing the scalp, a groove about an inch and a half in length, involving only the external table, was seen in the frontal bone. It appeared as if made by some blunt instrument. To the right of this groove was a yellow stripe, as if of matter contained in the bone. No fracture or fissure was observed at this time. The calvarium was now removed, whereupon thick yellow pus exuded, through the dura mater, from the anterior part of the right hemisphere, and also lay in contact with the skull. When the membrane was taken off it was found that the entire surface of the right hemisphere was

covered with thick greenish-yellow pus, about from two to three ounces in quantity. The anterior convolutions were depressed by it to the extent of quarter of an inch, so as to convey the appearance of loss of substance until the matter had been carefully pressed off with the handle of a scalpel, when they resumed their normal level. There was great congestion of the base of the brain and of the membranes. On section, nothing abnormal was discovered in the interior.

In the left pleural cavity there were found some forty ounces of straw coloured serum. An immense quantity of recent lymph had been poured out. The lower lobe of the lung was solidified, and the upper much congested. On section, a large number of small abscesses were found, perfectly circumscribed, and containing a thick greenish-yellow pus.

In the right lung a similar condition of affairs presented itself. There was not so much serum or lymph, but the abscesses were numerous, and two of them very large.

In the abdomen nothing abnormal could be discovered. On subsequently examining the calvarium, when cleaned, I discovered a minute fissure in the yellow part of the bone, which proved, on section, to contain pus in its diploe. In this way a chain of communication seemed to have been established between the suppurating wound on the head and the other lesions that were found. Purulent absorption had taken place, inducing pyæmia, with purulent depots or secondary abscesses in the lungs. It is a curious feature in the case, that so little that was indicative of brain disease had attracted attention during the life of the patient. It was remarkable that the brain should submit to so much pressure, that its convolutions should be largely depressed, and that no other symptom should result save headache.

At the trial of the boy who inflicted the injury, the counsel for the defence attempted to prove that the intimate connection between the disorder found in the chest and the injury of the head, as asserted in the medical evidence, was a groundless hypothesis—that the boy had enough of disease in his chest to kill him, independent of the head affection altogether, and that, consequently, no intelligent jury could possibly convict the prisoner of killing my patient. This plea, even had it been sustained, would, however, have been of no legal importance, as, whether the victim of violence be labouring under incurable disease or not, does not affect the legal guilt of the person committing the violence, however it may influence the amount of punishment awarded.

SURGICAL COMMENTARIES:

INTENDED AS A DIGEST OF THE AUTHOR'S PRINCIPLES AND PRACTICE, AS ILLUSTRATED BY THE MORE IMPORTANT SUBJECTS OF SURGERY.

By GEORGE MACILWAIN, F.R.C.S., Etc.

AUTHOR OF "MEDICINE AND SURGERY, ONE INDUCTIVE SCIENCE;" "THE UNITY OF THE BODY;" "DISEASES OF THE MUCOUS CANALS OF THE BODY;" "STRANGULATED HERNIA;" "LIFE OF ABERNETHY," AND OTHER WORKS.

NO. III.—OF THE LAW OF CONSERVATIVE DEPOSITION, OR DETERMINATION TO SURFACE.

From what has been already observed, it would appear that the improvement of the general health consists in, 1st, Equalizing the functions of the various organs of the body, so that each organ does its own share of work with no greater variation than results from the natural force in accommodating itself to natural varieties of external or internal influences. Before, however, we consider the mode in which this can be most auspiciously attempted, it will be necessary to remark on certain phenomena which have led me to employ the terms at the head of this paper. Many authors have thought it useful to consider the nature of "life" as an abstract force—and because their labours have been unprofitable, it has been too readily assumed that the variety of actions by which this force is exemplified in organised beings, constituted an obscurity, impenetrable to many who sought to develop the law or laws which they obeyed in common. This I believe to have been the source of great mischief. We know nothing of life as a abstract force it is true, but we know just as much of it as we do of light, heat, electricity, and magnetism. We know, in fact, nothing of the intrinsic nature of such forces, but we are capable of observing the phenomena they exhibit, and whenever the investigation is scientifically conducted, it is just as fruitful as the study of the abstract nature of these forces is barren. I need scarcely observe that all these forces have certain habits which, from the uniformity they present under similar circumstances, we regard as laws. It is, indeed, probable that on all subjects, those which, in our present knowledge, we call laws, are but axioms, as steps to higher generalizations. I cannot here repeat or extend what I have elsewhere written, but it is necessary, in order to clearness, that I should state briefly what I have enunciated elsewhere as the law which determines the site of diseased actions. I cannot assert, however, whether it be the law of inflammation, as first called the law of deposition, the law of determination to surface, or the conservative law. It is clear to me that valuable as the generalization is, it is only subordinate to some one higher, which we shall, no doubt, arrive at in the progress of really scientific investigation.

John Hunter had remarked on the tendency of bullets and other foreign bodies, as also of abscesses, to the surface, but had gone no further towards the generalization, which I first submitted in "Medicine and Surgery; one Inductive Science." The phenomena on which I founded the generalization are clear and indisputable, and will serve as guides with which we can seldom dispense, if we are to adopt anything like science in the treatment of disease.

These phenomena show that, *cæteris paribus*, "there is always a tendency to surface, and that, as a rule, it is coincident with a conservative tendency. Now, I beg the reader to regard these as separate propositions, because, although I regard them as alike indisputable, they rest on different grounds," the one being simply a demonstrable fact, the other the result of what I believe to be an unavoidable conclusion. A better opportunity of discussing the primary phenomena will occur as we proceed, therefore, I will at once draw attention to the sites of diseased action so called. The surface of the body, the skin, is so commonly the seat of diseased actions, and presents such a number and variety, that what are usually in common parlance called diseases of the skin, not only exceed, as regards outward manifestations of disease, those placed on any other site, but that of all others put together.

That modified inversion of the skin which constitutes the mucous membranes of the body, seems to present the next site in order of frequency.

It must be recollected that I here intend such abnormal actions as are usually termed disease, because if we were to regard every abnormal increase of secretion from these surfaces as disease, we should probably find them equal in number to those of the skin itself. But as we proceed I think we shall find it more correct to place mere increase of secretion, within certain bounds, in another category—in that which treats of actions which usually precede what we more commonly mean by the term disease. The mucous membranes represent the outlets to the body, which is an important feature to be kept in view in this generalization. The cellular tissue seems now to be the most frequent seat of diseased action. The mortar, as it were, as distinguished from the more essential material of the building. Here we find at their commencement all the numerous and dissimilar family of tumours, and those actions, which we referred to the skin, might be with equal propriety, at their *commencement*, be said to be in the cellular tissue. Even in cases where the mucous canals become the seats of new depositions, they almost always *begin* in the cellular tissue, exterior to the mucous membrane.

In this stage of our enquiry we begin to see something

of a conservative character in our phenomena. Whether we regard the outlets whence increased secretion has occurred, or, so to speak, the relative value of merely cellular or other structures, it begins to look as if the mischief were referred to parts which were either of less importance, or endowed with powers of absolute expulsion of the results of disordered action. Well, we proceed with other structures, and find that joints and glandular structures come next in frequency, and that at the commencement the external and membranous structures of joints are more frequently the seats of disease, *cæteris paribus*, than the bones which they cover. On examining the interior structures of the body we find the same tendencies to surface. I will not venture to estimate the vast majority of affections of the serous membranes of the body, as opposed to the actual substance of the organs invested by them. A man can hardly have examined even a hundred bodies, without perceiving this majority. The membranes of the brain, lungs, heart, abdominal viscera, and as a rare dissection has shewn even in the testes; all exemplify the vastly greater frequency of diseased actions in those parts, as compared to that of the substance of the organs they invest. Here we are tempted to use a new nomenclature, if for no other purpose, than as a scaffolding whence to ask further questions.

So far the result is certainly of a conservative character, as the tendency is from the more to the less important part. If this be so, is there any type or character in the history of the diseases or disorders, as the case may be, of the internal organs themselves, of this conservative tendency? We will not anticipate, but seek to find an answer in the further consideration of phenomena.

Mr. Hunter appears to me to have made the whole of his anatomical researches subservient to their highest application, viz., the more advantageous observation and interpretation of the phenomena exhibited by the body as a whole. With one remarkable and warning exception, which will form the subject of careful discussion before these papers are concluded, Mr. Hunter's researches were conducted in a strictly inductive spirit. It was this "circumspection" which presided over almost everything he did, that led Abernethy, with characteristic felicity of expression, to call him that "Argus-eyed" man. Hunter never sought the nature of any function from any single animal, but from animals in general. In like manner, his contemplation of the body as a whole is in remarkable contrast with the spirit in which so much subsequent investigation has been directed to individual organs.

Before we proceed to other phenomena, it is well to consider a little, those which we have already collected. Suppose we say for the present that as to site the order of frequency of disordered or diseased action, as distinguished from ordinary increase or alternation of secretion (by and bye to be more specially considered), be as follows:—

Skin Mucous membranes Glands (absorbent) Membranes of joints Bones of joints Serous membranes Organs invested thereby	Cellular tissue as first affected.

Now it is here necessary to remember that all laws are subject to interference; indeed, we can not name any law that I know of in nature which may not be *interfered* with by some other law. When we are exemplifying certain manifestations, we always speak with the suppressed premise that supposes "ordinary circumstances."

In like manner the law which determines, under circumstances of ordinary or normal power, the succession as to frequency, may be interfered with, so that any one site may be passed over. Direct injuries, whether mechanical or not, will necessarily determine the action of repair to the part. But as the complete obedience to the law supposes normal power, or non-interference—so the one being minus or the other present, any one of the sites mentioned may be passed over. I beg the reader to hold this in mind whether he agrees with it or not, because I have no doubt he will acknowledge the importance of this recognition, and find at the bedside, as we proceed, that it is not only a good guide to the detection of what the interference is, but an admirable test of the soundness of the generalization.

The power being normal, the succession of sites will be observed though there may be years between the occurrence of the phenomena, and thus may escape, as they have done, observation—or the succession of phenomena and sites may take place in a few months, or any shorter time. And again, the power varying—or what will be more demonstrable, the interfering influences greater—some, or any one of the more conservative sites may be stepped over, so to speak. In such cases, joints, serous membranes, any part may be attacked—the skin having never shown any phenomena or outward and visible sign. But those very cases, on investigation, will not be found to oppose, so much as they prove, the rule or law. This is all I have space for as yet, as regards the vast assemblage of phenomena which illustrate, so far, the law under discussion.

It now becomes necessary to consider, somewhat briefly, other phenomena which were particularly the subject of study by Hunter; first, because they have important relation to the law I have sketched; and, secondly, because it is necessary that these phenomena should be borne in mind, in estimating the correctness or use of the principles which it is my desire to enunciate. The phenomena which I have discussed more largely elsewhere are those which Mr. Hunter ranged under the term Sympathy. They attracted little notice in his time, and, I believe, scarcely any, except from two great minds, Cline and Abernethy. Mr. Abernethy said that the lectures excited so little interest that one half of the audience would be napping, and the other "gigling," but these great men did neither. Mr. Cline said, as Mr Clift once told me, "Sir," said he, "we must all go to school again." Abernethy arrived at the more salient results, which had an important bearing on the principles he taught when he said that "John Hunter showed that the whole body sympathized with all the parts," which is, by no great license of thought, translatable into the "Constitutional instinct of local disease." But here Abernethy, with that rapid perceptivity which enabled him to pluck, as I have said, a jewel from a mass of heterogeneous accompaniments, missed a great deal, the knowledge of which is absolutely necessary to the full development of his own principles. The truth is, that the phenomena of sympathy unfold to us relations of the first practical value, which involve no hypothesis, which are "inexorable" facts, and which can be obtained from no other source. In the next commentary I will endeavour briefly to summarize some of these facts and their practical bearings.

CEREBRO-SPINAL FEVER: ITS TREATMENT BY MEANS OF ICE.

By JOHN CHAPMAN, M.D., M.R.C.P.,
PHYSICIAN TO THE FARRINGDON DISPENSARY.

(Continued from page 54.)

HAVING, in my previous paper, described a method which I have devised, by which ice may be conveniently and very easily applied to the whole or to different parts of the spine, and having shown that, according to the authoritative testimony of Dr. Todd, the application of ice to the spine is, at all events, in some cases, of great use, I now proceed to adduce some facts and arguments which will perhaps be recognised as constituting strong *à priori* grounds for the opinion that the application of ice along the spine, as well as to the head, is likely to prove the most successful plan of treating Cerebro-Spinal Fever. If I succeed in this endeavour, the conclusion which I shall have justified, considered in connection with the actual experience already obtained in the treatment of this disease by means of ice, as described in an article in this

Journal for July 10, will, I hope, induce physicians to give the method in question a careful trial, whenever they have opportunities of doing so.

It is generally admitted that all the characteristic phenomena of cerebro-spinal fever denote that its chief seat is in the nervous system: those who maintain that the disease is the result of a blood-poison, and regard the morbid affections of the nervous system as secondary, and those who are of opinion that the first morbid change occurs in the nervous system, the symptoms usually referred to blood-poisoning being, in fact, due to the morbidly exalted action of that system, alike recognize that the principal lesions observable occur in the cerebro-spinal axis and its membranes, and that most of the distinguishing features of the malady are fully accounted for by the presence of those lesions.

I shall not now enter on the discussion whether or not the disease is due to a blood-poison, but it may be well to observe here that if a blood-poison were even recognised as its cause, until we ascertain indisputably the precise character of the supposed poison, as well as its *modus operandi* in producing the phenomena of the disease, it is not less hazardous than unscientific to treat the malady by administering empirically a variety of drugs, the action of which on the supposed poison is no less hypothetical and unknown than is the poison itself. Under such circumstances, the only course at once philosophical and safe is that of "treating symptoms" *by endeavouring in all cases when the proximate causes of those symptoms are known, to remove those causes.*

I am especially emphatic on this point, because there are different methods of "treating symptoms"—methods not only different, but in many instances diametrically opposed to each other. For example, in cases of cerebral excitement due to hyperæmia, the administration of opium in sufficient quantity, and the application of cold to the head, will each subdue the symptoms; but the mode of action, and probably the results of the two agents, are widely different. The opium induces such an increase of the morbid state which it is intended to remedy, as to constitute cerebral congestion, the presence of which is associated with quiescence; and as the influence of the drug on the brain subsides, while that influence on the vaso-motor nerve-centres is still active, cerebral anæmia may be induced, with permanent subjugation of the symptoms in question. But how often in such cases opium, while failing to produce this result, increases the dangerous condition against which it is employed, and while masking it, lulls the Physician into a state of false security, causing him to lose the precious time during which alone he has a chance of saving his patient, is, I believe, only too well-known to those who have extensive experience of this method. On the other hand, cold judiciously applied to the head acts as a direct sedative by lessening the amount of blood in the brain, and thus removing the cause of the symptoms, is a method of treatment at once scientific, effective, and free from the grave objection of certainly "doing evil" that possibly "good may come."

It seems to me that the symptoms of cerebro-spinal fever are conveniently divisible into three groups, the most distinctive features of which may be enumerated as follows:—

1.—*Symptoms of hyperæmia or inflammation of the encephalon: headache, mental depression, taciturnity, incoherence, hallucinations, vertigo, delirium, carphologia, somnolency, stupor, coma, contracted pupil, strabismus and other disorders of the eye, deafness.*

2.—*Symptoms of inflammation of the spinal cord and its membranes: pain along the spine and in the limbs, hyperæsthesia, trismus, retraction of the head, opisthotonos, pleurothotonos, rigidity of the recti muscles, contraction of the muscles of the extremities, convulsions, subsultus tendinum, excessive abundance of urine—often of low specific gravity, erotic desires—priapism, swelling of the tongue, nausea, vomiting, diarrhœa, petechiæ and vibices.*

3.—*Symptoms of hyperæmia—proceeding, it may be, to inflammation—of the ganglia of the sympathetic: chills, shiverings, flushes, and other morbid variations in the temperature of the skin, constipation, dilated pupils.*

Now, if the first group of symptoms be duly considered in connection with all the other phenomena of the disease, and especially the post-mortem revelations, we shall be led to the conclusion that the disordered circulation of the brain denoted by these symptoms, is one characterised by an excessive determination of blood to that organ. But this condition varies, of course, extremely in different cases, as well as at different periods of the disease in each case, and, action being commonly followed by reaction, afflux by efflux, it is not improbable that, in some cases, cerebral anæmia may succeed to cerebral hyperæmia, and that inasmuch as some of the symptoms of both states closely resemble each other, there may be danger without careful study of misinterpreting their significance. Headache, incoherence, hallucinations, vertigo, delirium, functional disorders of the eyes and ears, may alike co-exist with an excess or deficiency of blood in the brain; mental depression, taciturnity, somnolency, stupor, coma, may either denote that the brain is so full of blood that circulation is greatly restrained—perhaps all but arrested, or that it is so far deprived of the vital fluid that its functions are ceasing because its supply of nourishment is being cut off. But if all the conditions of the patient be studied attentively, and especially if the temperature of the head be carefully noted, there will be little difficulty in appreciating the actual condition of the cerebral circulation. Of course the treatment, either by medicines or by local and external applications of cold or heat, must be correspondingly different.

The treatment of an excessive afflux of blood to the head, resulting in degrees of injury ranging from slight functional disorder to acute inflammation, by the external application of cold is habitually resorted to, and is a process seemingly so simple that I may, perhaps, be thought to be wasting the time of my readers in offering any suggestions respecting it. There are, however, one or two which probably they have not duly considered, and which, I believe, are of great practical importance. If ice in a bladder, or india-rubber bag, be applied to the forehead of a healthy person, it will exert such a depressing influence on the brain as to become speedily intolerable, and, as I can testify, it may, in some cases, abolish consciousness; but if the cold be applied across the back and base of the head, from ear to ear, it may generally be borne for a long period, and hence, while a patient may rest the back of the head on an ice-pillow with impunity, and in cases where the use of cold is indicated with great advantage, the application of ice to the forehead needs to be watched with the greatest assiduity—its application, removal, and reapplication being regulated according to the symptoms and feelings of the patient. The most convenient plan I know of applying ice to the head is by means of the same bags which I use in applying ice to the spine: for adults, a bag about ten inches long, by four and a half wide, which being, in the first instance, made for the application of ice along the lumbar region, I called the "lumbar ice-bag," is especially convenient. It forms an excellent ice-pillow, or, if the patient wishes to sit up or move about, it can be kept across the occiput by a handkerchief tied round the head; it may also be applied over the vertix and forehead with great facility and comfort. I may here remark that cold can generally be borne longer over the coronal region than over the forehead, and that when applied to the latter, it can be borne for the greatest length of time without injury, if an attendant, holding the bag by each end, will glide it gently to and fro, applying it in succession to the upper and lower part of the forehead, now to one temple, then to the other. If it be desirable to apply cold more extensively and continuously, this may be very conveniently done by means of a full length spinal ice-bag, which, being placed across the occiput, and the two ends of it brought forward to the temples, may be bound in its place by a handkerchief. Care should be taken that the bag passes above the ears so as not to subject them to the cold.

For applying ice to the heads of children, shorter and narrower bags are necessary. The smallest spinal ice-bag yet made, which is eight inches long, and narrow in proportion, forms an excellent ice-pillow for infants; and of course the bags ten inches long and upwards answer equally well for "children of larger growth." In closing these suggestions concerning the application of ice to the head, I must insist upon the great importance of consulting the feelings of the patient: if ice applied across the forehead, for instance, should produce distress, the physician may rest assured that it is at the same time doing harm, and I urgently recommend all who apply cold or heat to the head or spine to act upon the general maxim, when either the one or the other is distressing, it is injurious, and, on the contrary, when it is agreeable, it is beneficial. Respecting the treatment of the disease in question, it is an extremely fortunate circumstance that that part of the head where the sedative influence of cold is most needed—viz., the occiput, is precisely the part where its application is tolerated for the greatest length of time; and I may add that *so long* as *dry* cold thus applied is tolerable, its application may be continued with perfect safety.

I will now advert to the use of cold and heat, as agents by which the circulation of blood in the head may be *indirectly* modified. In cases of cerebral hyperæmia or congestion not associated with any distinctive and like disorder of the spinal cord, the application of heat along the lower cervical and upper dorsal vertebræ will usually result in reducing the cerebral circulation. But, as in cerebro-spinal fever, the cord as well as the brain is more or less inflamed, it seems to me that heat thus applied may possibly not do good, but harm. Bearing in mind, however, the well-known fact, as well as the reasons for it—viz., that inflamed parts are sometimes treated most beneficially by the application of heat, sometimes by the application of cold.* I should not think much risk of injury would be incurred by applying heat as mentioned, and, in cases in which seemingly the disease is mainly restricted to the brain, I should be disposed to try it. The spinal water-bag which I employ for the application of heat is peculiarly adapted for its use, if it can be used at all, for the treatment of this disease: it consists of two parallel columns a certain distance apart, and united at top and bottom. The heat is thus applied along each side, but not over the spine, and therefore, in so far as the vaso-motor nerve centres related to the cerebral arteries may be influenced by heat, they are thus influenced by this method, while the amount of heat inevitably reaching the spinal cord at the same time, is reduced to a minimum. The eight-inch bag is the most suitable one for the purpose here intended. The temperature of the water used should not be less than 110°, or more than 120° Fah. I cannot emphasize too strongly the truth that the lower the temperature of the water consistently with obtaining the object in view, the better: the chances of reaction are correspondingly less; whereas, if water of a high temperature be employed, its *direct* influence as an excitant on the cord, and through it on the brain, will more than counterbalance its *indirect* sedative influence operating through the agency of the sympathetic.

Another method of exerting a sedative influence on the brain consists in the application of ice along the lower third of the spinal cord, *care being taken that the cold does not extend at all on to the sacrum.* The influence of the ice thus applied on the cerebral circulation is two-fold:—*First*, by its directly sedative influence on the lower part of the spinal cord it cuts of all those exciting impressions, which, owing to its morbid state, might otherwise be propagated from it to the brain. *Second*, the sedative influence of the ice on the collateral sympathetic ganglia conduces to the dilatation of the arteries throughout the lower half of the body, a proportionately increased supply of blood, therefore, pervades it, and, inasmuch as the total amount in the body remains the same, a certain quantity of that increased supply is necessarily derived from the brain. Ice may be thus applied in suitable cases for hours together with perfect safety; but in the treatment of women the power of ice when applied in the lumbar region to promote or increase the menstrual flow, must be borne in mind. An extensive experience enables me to state confidently that by the daily use of ice in this manner, a distinctly sedative influence on the brain may be exerted.

The practice of applying heat to the feet, in order to derive blood from the brain, is so common, and its efficacy is so well appreciated, that I advert to it only for the sake of making one remark in the shape of a caution. If the feet be put in very hot water, the result is to raise the temperature of all the blood throughout the body. As each part of the blood which courses through the feet receives from the water a certain amount of heat in addition to that from the chemical changes incidental to its passage through the capillaries, the heat thus obtained in excess of the normal amount, is carried forward by the blood in the veins, is diffused through the system, and the brain of course receives its share of the excess. In this manner the *direct* stimulus to the brain of the increased temperature of the blood in general neutralizes more or less, and in some cases, I am confident, more than neutralizes the *indirect* sedative influence intended to be exerted by applying heat to the feet. It is obvious, therefore, that water only a few degrees above the temperature of the blood, is best adapted, when applied to the feet, to exercise by derivation an indirect sedative influence on the brain.

(To be continued.)

* See Sir William Fergusson's *System of Practical Surgery*, third edition, pp. 77-8. Speaking of heat and cold as agents for subduing inflammation, he wisely says,—"I could, in many instances, trust greatly to the feelings of a patient, and the seeming effects of the remedy otherwise, in persisting in the use of the one or the other."

ON THE INFLUENCE OF CLIMATE IN THE PREVENTION AND CURE OF CHRONIC TUBERCULAR PHTHISIS.

By EDWIN LEE, M.D., Etc.

[*Abstract of a Communication read and discussed at the Annual Meeting of the Scientific Congress of France, held at Aix, in Provence, and at Nice, in December*, 1866; *with additional observations on the subject.*]

(Continued from page 51.)

In my prize essay on the "Effect of Climate on Tuberculous Disease," I have endeavoured to show that climate acts most benefically by favouring the insensible cutaneous excretion, the partial or total suppression of which, from the continued operation of a humid atmosphere, I regard as a principal predisposing cause of the formation of tubercle in the lungs, and to promote this object by other than artificial means, regular exercise in the open air, regulated, of course, by the patient's amount of strength, is indispensable. There is, I think, no doubt that horse-exercise is beneficial in this way. Before the advantages of climate were appreciated in consumption, our highest medical anthority, Syndenham, was quite enthusiastic in his praises of this exercise as a remedial means. "I have put," he says, "very many upon this exercise, in order to the cure of consumption, and I can truly say I have missed the cure of very few, insomuch that I think how fatal soever this disease be above all others, and how common soever, yet it is in this way more certainly cured than most diseases of less moment, provided always that this travelling be long persisted in, according to the age of the patient and the length of the disease, and provided also, that he goes into new places; for the change of air and diet do as considerably add to the cure as the exercise itself."*

Horse exercise acts, as do also sea voyages, in the same way, in promoting the insensible perspiration, which, in this case, is further favoured by the muscular exertion it entails, by carrying the body more or less rapidly through the air, which comes to much the same as if the body were quiescent, and the air agitated—as is generally the case on

* Works printed for the Sydenham Society, vol. ii.

shipboard. The lungs themselves are but little affected by an agitated air, though the air-passages may be more or less so. "Air in motion," says Dr. Milne Edwards, in his work on the 'Influence of Physical Agents on Life,' "acts only on exposed surfaces, as the integuments of the body; those of the lungs are sheltered, and notwithstanding their communication with the atmosphere, the agitation of the air has but a slight share in the quantity of vapour which they furnish. This consideration will serve to determine the choice of suitable places for the residence of delicate persons. Those to whom the evaporation from the lungs is injurious, ought to prefer an atmosphere less dry, but slightly agitated, whence it is important to obtain an agreeable freshness.

"The slight agitation of the air when its hygrometrical state and temperature are adapted to the system, produces such a feeling of well-being, that the chest dilates in consequence, and admits a larger proportion of air. Persons who have delicate lungs, owe, in great degree, the difficulty and oppression which they feel, to the smallness of their apartment. This difficulty decreases on their going into a large room, or the open air."

The avoidance of a too monotonous mode of life, and the patients maintaining a cheerful tone of mind, are essential adjuvants to the action of climate in effecting an amelioration in all cases, more especially when pulmonary disease has been mainly induced by the operation of depressing mental influences, as not unfrequently happens. The consideration as to the resources for mental and bodily occupation or recreation possessed by places in which patients with pulmonary disease are recommended to sojourn during the inclement seasons of the year, is therefore a most important one, and yet it appears to have been overlooked by some writers who, relying upon meteorological data, speak highly of the climates of particular localities, as favourable ones for consumptive invalids, although destitute of similar resources, and even of tolerable accommodation.

The conclusions deducible from the preceding brief observations are, that the effects of climate in counteracting the causes most instrumental in the production and development of tubercular disease in the lungs should be estimated not merely with reference to the action of this agent upon the organs of respiration, but especially as respects its general influence on the system—a principal advantage which invalids derive from a winter's residence in a suitable southern locality being, that they are enabled to be much in the open air, which, by causing free expansion of the lungs, and a diminished susceptibility of the air-passages, by improving the functions of digestion, and especially by exciting those of the skin, through this means, and the influence of the sun's warmth, to greater activity than could be the case in persons who remain indoors or under a cloudy sky, as also by inducing a cheerful tone of mind through such influence, and by the variety of objects calculated to divert the attention from dwelling upon the state of health. It is in this way that climate conduces most effectually to prevent the occurrence of phthisis when threatened; to rectify, when existing, that abnormal condition of the blood which gives rise to the formation of tubercle; and to obviate, better than by any other means the lesions which are the natural consequence, when they have not been allowed to proceed too far.

The places most calculated to meet these indications in the majority of impending or existing chronic cases of pulmonary phthisis, as most frequently met with in northern constitutions, are, in my opinion, those which lie along the Mediterranean coast, from Hyerès to San Remo, including Cannes, Nice, and its immediate neighbourhood, and Menton, all of which, though possessing climatic characteristics in common, are yet sufficiently distinguished from each other by local peculiarities as to shelter, more or less freedom from certain winds, &c., as to make them adapted to meet the particular requirements in individual cases. They possess, moreover, the advantage of being at a moderate distance from each other, so that, as very commonly happens, when a change is advisable after a few weeks, or two or three months' sojourn, it can be made from one to another in most cases with but little risk or inconvenience. I need scarcely add that their nearness to England, and the superior accommodation now presented to visitors, are very important points in the estimation, not only of patients and their friends, but also of their medical advisers.

Many years ago, Laennec observed, in his "Traité de l'Auscultation Mediate," on the subject of climate—"Of all the means that have been had recourse to up to the present time, there is none that has been more frequently followed by the arrest or the cure of pulmonary phthisis than change of locality. The sea-shore, especially localities having a mild and temperate climate, are unquestionably the places where the greatest number of cures have been effected."

A distinguished living physician, after remarking that "the fact of recovery from phthisis, *even in its most advanced stage*, (?) can no longer be doubted," adds, "by carefully observing the operations of nature, learning her methods of cure, imitating it as closely as possible, avoiding what she points out to be injurious, and furnishing what she evidently requires, that we at length arrive at rational indications of treatment." The most important means are attention to the air breathed, that is climate, to exercise, and diet. Adverting to "that exhilarating feeling which the traveller experiences during early Spring in the South of France, and on the borders of the Mediterranean, caused by the clear atmosphere, balmy air, and luxuriant landscapes, this author proceeds to say—"He who has felt that delightful sensation, and paid attention to its influences on his own bodily powers, will not easily abandon the idea that such influence, if rightly directed to the relief of certain morbid conditions, must have some effect." *

The localities I have specified, as those to which I would give the preference in a large proportion of the cases of remediable phthisis may, in fact, be considered as supplying, in great measure, the requirements mentioned by Dr. Richardson in his work on the "Hygienic Treatment of Pulmonary Consumption" of an "hypothetical Atlantis for consumption"—viz., "It should be near the sea-coast, and sheltered from northerly winds; the soil should be dry, the drinking water pure, the mean temperature about 60, with a range of not more than 10 or 15 degrees on either side. Extremes of dryness and moisture are alike injurious. It is of importance in selecting a locality that the scenery should be enticing, so that the patient may be the more encouraged to spend his time out of doors in walking or riding exercise."

I have thus adduced various opinions of eminent men confirmatory of my own, as to the kind of climate most calculated to be beneficial to the majority of subjects predisposed to, or suffering from, pulmonary phthisis (in the early and middle stages). There are other places besides those I have referred to, possessing a climate of a somewhat similar character, in so far as sunshine, a generally cloudless sky, absence of rain to any extent in winter, a light dry atmosphere, are concerned, and these are doubtless not unsuited, as resorts for the season, to many of the above specified cases; but there are considerable drawbacks to their being frequented in any great degree—independently of their increased distance from England, and their inaccessibility unless by sea; one of the principal of which is, that each is far from any other health resort, and if, soon after the patient's arrival, the place is found not to agree, there is no remedy but to remain, and get on as best he may, or to undertake another long journey at an unfavourable time of the year; or the climate may be beneficial for a certain period, as two or

* The Pathology and Treatment of Pulmonary Consumption, by Dr. Hughes Bennett. Edinburgh, Second Edition. "Some years ago," says Dr. Bennett, "I succeeded in confining a consumptive patient to his own room for an entire winter. His spirits suffered greatly, but, on the whole, he supported the confinement with resolution. Next winter, however, nothing would induce him to remain at home, and one day he rushed out of the house, ascended Arthur's Seat, and was much better in consequence."

three months, after which, from its too great dryness and exciting quality, or, from other causes, its continuance may prove injurious, and a change may be advisable, when the same difficulty would occur; for, climate, like any therapeutical agent, requires to be regulated by doseing according to circumstances, as in the course of the six months winter and spring seasons, not only does the climate of every place undergo important changes, but the constitution of individuals, especially of pulmonary invalids, becomes materially modified by its influence, so that while many remain with advantage during the six months or longer in one place, there are others who cannot do so with impunity, and without experiencing an aggravation of the complaint, which was at first benefited. The same observation necessarily applies as well to a climate of a sedative as to one of an exciting and bracing character. Where the former is indicated by the nature of the case, a few weeks or a three months sojourn in the place will often produce the desired effect upon the system; whereas, by too greatly prolonging their sojourn, patients, in many cases, though not in all, become greatly depressed in general tone and spirits. Hence, patients should not generally be peremptorily advised to go to such or such a place for the winter, for the trial has always to be made as to how the locality chosen will agree.

Another drawback to the places distant from England to which I refer (as Upper Egypt, Algiers, the South-eastern coast of Spain, &c.), is that as the heat there sets in early in the year, and steadily increases, and as there is no intermediate climate accessible within a moderate distance, the contrast, as respects the state of the weather, cannot fail to be painfully experienced by, and subjects to the greatest risks, sensitive invalids, who have been basking for several months in sunshine, on their returning northwards on the approach of summer.

A third inconvenience as respects a winter sojourn in Egypt, especially on ascending the Nile, is the want of any suitable accommodation for invalids requiring attention, the comparative privation of walking exercise, and the confinement to the small boat. Indeed, the whole district is said, by a French physician, for several years resident at Alexandria, who has written a work on the climate of Egypt (Dr. Schnepp) to be prejudicial to consumptive patients, owing not only to the above-mentioned cases, but also to the extreme variations of temperature between the middle portion of the day and the mornings, and evenings on the Nile, to the strong wind which, setting in about the middle or end of March, blows up the course of the river, raising clouds of dust on its banks.

The place most frequented on the Spanish coast is Malaga (of which I have given an account in my work on the climates of Spain), the neighbourhood of which presents but little attractions for walking exercise, and where the accommodation is but indifferent, there being no lodgings or furnished houses to be hired, so that the winter visitors, consisting of invalids (several in a more or less advanced state of disease) and their friends, are for the most part congregated in three or four hotels; consequently, every serious aggravation of symptoms in any of the party, and every death that occurs must be known to the rest, and it need scarcely be said cannot fail to have a very depressing effect upon them.

I have hitherto been considering the cases to which a climate, characterised by moderate dryness of the atmosphere, and of a bracing and exciting kind is most applicable, but on the other hand, there are many to which such a climate would be positively injurious; where, from excitability of the system, inflammatory action in the lungs or air-passages, a tendency to active hemoptysis, or from extensive lesion, the disease being in an advanced stage, the attempt to improve the general state of the constitution must either be abandoned, or must be postponed to a more favourable period, should such arrive; and where consequently a warm sedative and moister atmosphere, but little agitated by winds, would present the greatest probability of advantage from the influence of climate. The most frequented as well as the most easily accessible place, possessing a climate of this kind is Pau. The climate of Biarritz on the Atlantic coast is of a more bracing character, but would not be suitable for many patients in spring, owing to the gales from the ocean at this period. From these, Arcachon, which has come more into notice of late years, is more sheltered, being situate on an inclosed basin of the Atlantic, and consisting, for the most part, of detached houses among pine woods. Visitors frequently migrate from one to the other of these places (which are described in my "Health Resorts of the South of France"), and there is also an accession in the spring of several of those who had been previously staying in the winter stations on the south-eastern coast of France, or visiting the chief cities of Italy.

To many cases of this kind several places of winter resort in England, though not possessing the same facilities for taking out-door exercise as foreign ones, would be well adapted, and, to not a few, would be more suitable than migration abroad.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.

GALVANISM IN THE TREATMENT OF TUMOURS.

[Reported by Mr. BRADFORD.]

Mr. Collis for some months past has been trying various forms of galvanism in the treatment of tumours.

In December last he employed galvanism somewhat after the method advised by Dr. Althaus, but he has latterly made use of feebler currents, both as regards quantity and tension. The following observations are from his cases:—

James M'Cann, æt. 65, affected with the unusual form of primary encephaloid cancer of the groin.

December 11th, 1866.—Mr. Collis inserted a steel-pointed needle into the centre of the tumour, and connected it with the negative (zinc) pole of a twenty-four celled Daniell's battery. The circuit was completed by bringing the conductor from the positive (copper) pole into contact with the skin over the outer margin of the tumour, a wet sponge being interposed; a current was thus passed through a portion of the tumour. Some pain was experienced, by no means excessive; the current was kept up for ten minutes. Bubbles of gas (hydrogen) were seen to form round the needle, and some froth accumulated about it, which, when tested, gave an alkaline reaction (ammonia). At the end of ten minutes the needle was withdrawn, the froth and moisture wiped off, when a cavity was found to have been made in the tumour large enough to contain a cedar pencil; its margins were black and pulpy. The skin where the sponge lay was white, and looked like a part which was frost-bitten. Next day the cavity in the tumour was large enough to admit the little finger to the depth of an inch; the white spot was covered with a film of loosely adhering cuticle; on removing this film the skin underneath seemed natural. On many subsequent occasions this tumour was similarly treated, so that much of it was broken up; but, as in all cases of cancer, which are acted on by agents of power inadequate to their complete and immediate destruction, the disease extended circumferentially, at least as fast as it was broken up in the centre, and the man finally died of sudden hæmorrhage from the femoral artery. The use of the galvanism current became gradually more painful, even though it was reduced in strength to eighteen, twelve, and finally six cells; for some weeks before death it was given up as both painful and useless.

Mr. Collis seems to be of opinion that Dr. Althaus's method of electrolysis is applicable to nœvi and similar innocent growths, but that if electricity or galvanism is to be useful in the dispersion of tumours, it must

be applied on a different principle, and that instead of seeking directly to decompose them into their elements, we should use the galvanic current, so as if possible to modify their nutrition. By passing a galvanic current from the positive pole down a muscle, it can be restored in some cases of atrophy; this is seen in the wasting of the deltoid from injuries to the circumflex nerve. Here a steady galvanic current, if not too long carried on, will restore the muscle to its proper volume.

It seems not improbable that a current from the opposite pole might have an opposite effect on the nutrition of a part through which it is conducted. Mr. Collis mentioned a remarkable fact in connection with this view, namely—that when a plate of zinc and another of copper are placed upon the skin and connected together, an ulcer of extremely intractable nature will form under the zinc plate, if it be kept on the same spot for a couple of weeks—the reversing of the plates alone will heal it rapidly.

Mr. Collis tried various forms of battery, and finally selected a simple voltaic pile, composed of from twelve to sixteen pairs of zinc and copper plate one and a-half inch square, with intervening folds of felt. This battery was rendered sufficiently active, by being dipped in salt and water once a day, and tied up in a gutta-percha bag.

The following are a few of the cases in which this battery has been used :—

Donohue, æt. 60; secondary cancer in glands under the jaw.

Battery applied 16th May; a plate of copper in connection with the positive pole, was fastened by a piece of adhesive plaster to the back of the neck; a similar plate in connection with the negative pole was placed directly over the gland. This gland lay on the left side of the neck, and was the size of a large walnut. In three days this gland had almost disappeared; it was level with the surface, and could be felt with difficulty. The apparatus was removed; it began to grow next day, and in three days it was the size of a bean. The battery was again applied, and in three days he began to complain of pain; the skin was found to be moist and red, but the gland had entirely disappeared. He remained some time in the hospital to see if it would return, and to teach him how to keep the batteries to a similar gland on the right side of his neck. His business obliged him to leave the hospital before the cure was complete on that side.

Bridget M'Enroe, æt. 18; enormous glandular enlargement on the left side of the neck. Iodine in every form had been used internally and externally, but without effect. The strong iodide of mercury failed to check their growth. The girl looked very healthy, but was shockingly deformed by the tumour, which reached from the middle of the cheek to the clavicle, and from the chin far behind the ear.

June 24.—The battery was applied in a similar manner, with the exception that perforated zinc was used in place of copper over the tumour. A considerable reduction took place in a week, when the skin began to soften, and it was judged advisable to remove the battery for a few days.

Another battery of a different construction was made by Mr. Lyddon. It can scarcely be explained without a woodcut, but it combines lightness and a fair degree of permanence with sufficient power. The surface of the tumour was covered with a plate of silver-foil in connection with the negative pole. In the first twenty-four hours the growth diminished about one-fourth, and Mr. Collis confidently expects it to disappear in a few days.

In another case, a large and very hard tumour of the thigh, diminished an inch and a half in circumference in three days, on application of the battery, and Mr. Collis mentioned that he was using galvanism, with great benefit, in various other cases.

There is little doubt that early in the present century the use of galvanism in such cases was too lightly discarded, owing, in part, to ignorance of its nature, and in part to the miraculous powers expected from it. On failure of these expectations, it was laid aside without a sufficient endeavour to ascertain what it could do, and what modifications are required to render it efficient under circumstances which may widely differ from one another.

Examination Papers.

UNIVERSITY OF DUBLIN, TRINITY COLLEGE.

MEDICAL SCHOLARSHIP EXAMINATION.

TRINITY 1867.

Anatomy.—Professor M'Dowel.

1. The origin and intra-spinal relations of the spinal accessory nerve?

2. Describe a spinal nerve, its mode of origin, intra-spinal course, and general mode of distribution.

3. Enumerate the branches of the external carotid, dividing them into those given off (*a*) below and those given off (*b*) above the digastric muscle.

4. Give the nervous supply of the following muscles :—Trapezius, Serratus Magnus, Subscapularis, Pectoralis Minor, Teres Minor, Deltoid, Brachiæus Internus.

5. Define the position and extent of the cavity of the omentum, and mention the boundaries of the foramen of Winslow.

6. Trace from its origin the gastro-duodenalis artery, and its branches.

7. What parts would you remove in order to exhibit the deep muscles of the back of the leg? Mention the origins and relative positions of these muscles.

8. Enumerate the branches, and mention the muscular relations of the anterior tibial artery in its course down the leg.

9. Enumerate the bones with which the external cuneiform, second metatarsal and cuboid bones, respectively, are articulated.

10. The ligaments which are connected with the lower end of the fibula, and their several bony attachments.

Chemistry.—Dr. Apjohn.

1. A thermometer with moistened bulb in ordinary states of the atmosphere shows a temperature lower than that of the air; explain the cause of this, and why it does not continue to descend indefinitely.

2. When a plate of zinc and a plate of copper are immersed in an acid, and then inclined so as to make them touch, certain phenomena are witnessed; state what these are, and give a general rule for inferring the direction of the galvanic current.

3. Describe and explain the process of the British Pharmacopœia for preparing "acidum phosphoricum dilutum," and mention the tests which should be applied to the product for the purpose of ascertaining whether it does or does not contain pyrophosphoric or metaphosphoric acid.

4. Write the formula of oil of vitriol; explain its action on chloride of calcium; and give the tests for detecting in it nitric, arsenious, or arsenic acids, should such be present.

5. What is the composition of bone-earth, and how would you treat it so as to extract from it "calcis phosphas præcipitata."

6. Give the processes for the preparation of the arseniate and phosphate of iron of the British Pharmacopœia; mention also how these preparations may be distinguished from each other, and how the amount of iron present in each as protoxide may be determined volumetrically.

7. Detail and explain the different steps of the process for converting hydrocyanic acid into Prussian blue.

8. Give a succinct account of the process for preparing tartaric acid; write its formula, and mention the tests for distinguishing it from the oxalic and citric acids.

9. What are the integer numbers which represent approximately the ratio between the respective weights of fibrin, albumen, and globules in normal blood; state also the proximate principles which enter into the constitution of the globules, and how they may be separated from each other.

10. Hippuric acid, discovered by Liebig in human urine, is now viewed as a colligated acid ; explain how it is prepared from the urine of the cow, write its formula, and mention the proximate principles which enter into its constitution.

BOTANY—DR. DICKSON.

1. How are the tubers of the Potato or Jerusalem Artichoke to be distinguished from thickened roots ?
2. In what part of the exogenous stem does the liber or bast-layer occur ?
3. What constitutes the "stone" in a drupe ?
4. What is a lomentum ?
5. What is meant by the terms *monœcious* and *diœcious?*
6. By what means does the pollen-grain effect a communication with the ovule ?
7. How do plants purify the atmosphere from the effects of animal respiration, and what parts of the plant appear to be most active in this process ?
8. State the general character of the natural order Papaveraceæ as to *leaves, calyx, corolla, stamens, ovary,* and *fruit.*
9. How is the ovary of a Berberidaceous plant to be distinguished from that of a Papaveraceous one ?
10. State the natural order and sub-order of the plant before you, and the form of inflorescence here exhibited.

MATERIA MEDICA—DR. AQUILLA SMITH.

1. Give the official names of the plants which yield Aconitia, Atropia, Beberia, and Veratria, and the composition of "Unguentum Veratriæ."
2. State the exact composition of "Pulvis Jalapæ Compositus" and of "Pulvis Scammonii Compositus."
3. Give the botanical names and distinctive characters of the three kinds of Buchu in the Pharmacopœia.
4. Contrast the characters of carbonate of Soda and Carbonate of Potash, and give the tests for Potash.
5. Give the botanical names of the drugs derived from the Natural order "Euphorbiaceæ."
6. State the composition of "Confectio Terebinthinæ," and explain the principle on which it is made, in order to prevent the oil of turpentine from floating when the Confection is rubbed up with water.
7. What is the difference in the composition of "Pilula Aloes Barba densis" and "Pilula Aloes Socotrinæ"?
8. Name the five solvents which are employed in making the Tinctures in the Pharmacopœia, and give an example of each.
9. Describe "Catechu Pallidum." From what plant is it obtained ? and what preparation of it is in the Pharmacopœia?
10. How many grains of "Pilula Ferri Iodidi" are equivalent to one fluid drachm of "Syrupus Ferri Iodidi"?

ST. ANDREWS MEDICAL GRADUATES' ASSOCIATION.

ON Monday, the 15th instant, a deputation of this Association waited upon Sir Graham Montgomery, Bart., M.P. for Peebles, to urge upon him the injustice that the Scotch Reform Bill, in its present form, is likely to inflict upon the great majority of the Graduates of this University.

Sir Graham listened with great attention to the statements made, and appeared fully to understand the nature of the grievance complained of by the Association. He evidently took pains to master the details of the subject, and promised the deputation to bring the facts under the notice of the Lord Advocate, who has charge of the Bill.

As it is understood that the Scotch Reform Bill will not be proceeded with this year, the Association will have time to take measures for securing an alteration in the clause before its introduction next session. There is no doubt that the Graduates as a body are sensible of the slight offered them, and will bring all their influence to bear upon individual members of Parliament.

Among the speakers were Drs. Richardson, Rogers, Ballard, Sedgwick, Dudfield, Williams, Prosser James, Seaton, and Ray.

The following information, prepared for the Association, contains most of the facts alluded to by the speakers, and will, therefore, serve as an epitome of the representations made to Sir G. Montgomery:—

The proposed new Reform Bill for Scotland, which provides for the representation in Parliament of the Universities of Edinburgh and St. Andrews conjointly, will practically exclude from the franchise all Graduates of St. Andrews who obtained their degrees before January 1, 1863. This exclusion is based mainly on the assumption that these Graduates were not examined for their degrees, but obtained them by purchase. As such an impression, which by the medical world is at once recognized as entirely and wantonly false, has been widely disseminated, and has even been conveyed to members of the Government, the Council of the St. Andrews Medical Graduates' Association instructed us, at their meeting of the 28th ult., to collate and publish the facts bearing on the examination and status of the Medical Graduates of St. Andrews. In obedience to this instruction, we have prepared the following statement, based on official information.

The University of St. Andrews was one of the first to institute examinations for medical degrees, and has ever been foremost in adopting alterations to ensure the proficiency of its Graduates.

It is utterly untrue that the St. Andrews degree can be obtained by purchase. The Registrar of the University writes:—"There is no truth whatever that the degrees were got by purchase. During the war at the end of last century and beginning of the present, degrees were granted to candidates obtaining appointments in the army and navy, for instant duty, on certificates from three or four *eminent* London physicians, &c., and then often were rejected from the certificates being unsatisfactory."

The examination lasts three days ; it is partly written and partly *viva voce,* and is in every respect similar to the examination for Membership of the Royal College of Physicians of London.

The University of St. Andrews was almost the first to institute examinations at the bedside.

The Examiners are unbiassed, a certain number of them being invariably distinguished Graduates of other Universities, and all of them being unknown to the candidates.

The number of rejections is an evidence of the strictness of the examinational test. In 1858, when the question of representation in the Medical Council was being considered, the official returns of the University showed that the rejections numbered one in four ; a proportion higher than that of any other examining body, except the University of London ; and this, although nearly all the rejected candidates were at the time legally-qualified practitioners.

Another strong proof of the efficiency of the examination, and the clearest refutation of the objection that the St. Andrews M.D. is not fitted for the franchise, is afforded by the statistics presented for the last three years to the Medical Council by the chiefs of the Army and Navy Medical Departments, which show the qualifications of the gentlemen who were examined by the Boards prior to employment in the services. As all the candidates must have a qualification before offering themselves for examination, the ratio of rejections must be considered conclusive proof of the value of each degree. We wish to make no disparaging remarks on other examining bodies, but we are bound to draw the following comparison :—

32·52 per cent. of the Members of the Royal College of Surgeons,
18·18 per cent. of the Doctors of Medicine of Edinburgh, and only
8·33 per cent. of the Doctors of Medicine of St. Andrews,

failed to satisfy the authorities they were fit to be trusted with the lives and limbs of our soldiers and sailors.

If the severity of the examination tests in such a satisfactory manner the professional attainments of the Graduates in the earlier part of their career, the social and professional position to which many of them have afterwards attained, is an indorsement of the original approval. In London alone, thirty-seven Graduates of St. Andrews are attached to the Schools of Medicine, the Hospitals, and the larger Infirmaries ; they hold important posts in St. Bartholomew's, Guy's, St. George's, Westminster, London, Charing Cross, Bethlehem, St. Luke's, Royal Free, Consumption, Queen Charlotte's, Samaritan, Great Northern, Metropolitan Free, City of Lon-

don for Diseases of the Chest, West London, Soho-square for Women, and the French Hospitals, at the Royal Infirmary for Diseases of the Chest, and the Ear Infirmary, and at the Farringdon, Finsbury, City, Marylebone, Pimlico, and Islington Dispensaries.

Doctors of Medicine of St. Andrews are also to be found in connection with Queen's College, Birmingham, and Newcastle-on-Tyne College; with the Schools of Medicine at Edinburgh, Dublin, Liverpool, Leeds, Manchester, Sheffield and Hull; with the Hospitals at Belfast, Waterford, Glasgow, Inverness, Leith, Dundee, Lincoln, Derby, Carlisle, York, Stafford, Nottingham, Birkenhead, Brighton, Bradford, Bath, Leamington, Winchester, Cheltenham, Halifax, Bristol, Rochester, South Staffordshire, Worthing, Chorlton, Portsmouth, Chatham, Coventry, Worcester, and Glamorgan; and with the County Asylums of Middlesex, York, Cambridge, Derby, Lincoln, Sussex, Surrey, Stafford, Lancashire, and Cheshire. They also number in their ranks two Deputy Lieutenants, twelve Justices of the Peace, a Visitor in Lunacy, ten Coroners and Deputy Coroners, five Examiners in Medicine and six Officers of Health.

Two are Fellows of the Royal Society, ten are Fellows of the Royal College of Physicians of London, and fifty-five are Fellows of the Royal College of Surgeons of England.

BRITISH MEDICAL ASSOCIATION.

ANNUAL MEETING.

PROGRAMME OF PROCEEDINGS.

THE thirty-fifth Annual meeting of the British Medical Association will be held in Dublin, on Tuesday, Wednesday, Thursday, and Friday, the 6th, 7th, 8th, and 9th days of August next.

All the meetings will be held in the New Buildings, Trinity College.

There will be four separate Sections; viz., A. Medicine; B. Physiology; C. Surgery; D. Midwifery. Only two Sections will sit at the same time, unless there shall be great pressure of business.

The papers introducing the subjects for discussion on Scientific and State Medicine, shall not exceed *thirty* minutes. Papers on any other subject shall not exceed *twenty* minutes. All subsequent speakers not to exceed *ten* minutes.

TUESDAY, *August 6th*, 1867.

10 A.M. Meeting of Committee of Council.
11 „ Meeting of General Council.
1 P.M Adjourn for Luncheon.
2 „ First General Meeting.—The retiring President, Dr. Waters will resign his office.—The new President, Professor STOKES, M.D., will deliver his Inaugural address.—The Council report will be read, and discussion taken thereon.—Election of General Secretary.—Report of Charter Subcommittee.—Report of Medical Benevolent Fund.—Appointment of Place of Meeting in 1868, and President-Elect.
9 P.M. *Soirée* at the Obstetrical Society.

WEDNESDAY, *August 7th*.

8·30 A.M. Public Breakfast at the Exhibition Building.
9·30 „ Committee on the observation and Registration of Disease.
10 A.M. Meeting of new General Council.
11 „ Second General Meeting—Address in Medicine by Sir D. CORRIGAN, Bart—Sectional Meetings.
2 P.M. Adjourn for Luncheon.
8 „ Third General Meeting.—Mr. RUMSEY will introduce the subject of State Medicine for discussion.—Sectional Meetings.
6 P.M. Adjourn.
9 „ The President's *Soirée* at the King and Queen's College of Physicians.

THURSDAY, *August 8th*.

10 A.M. Fourth General Meeting.—Address in Surgery by Professor R. W. SMITH.—Sectional Meetings.
2 P.M. Adjourn for Luncheon
8 „ Fifth General Meeting.—Professor HUGHES BENNETT, M.D., will introduce for discussion the Effects of Mercury—Sectional Meetings.
6 P.M. Adjourn,
7 „ Public Dinner at the Exhibition Building. Tickets £1 1.

FRIDAY, *August 9th*.

10 A.M. Sixth General Meeting.—Sectional Meetings.
2 P.M. Adjourn for Luncheon.
3 „ Seventh General Meeting.—Sectional Meetings.
9 „ *Soirée* at the Royal College of Surgeons.

SATURDAY, *August 10th*.—Excursions.

Papers have been promised by

Dr. HENRY BENNET—Treatment of Pulmonary Consumption.

Dr. MCCALL ANDERSON—On a case of Ephidrosis Cruenta or Bloody Sweet; with Remarks.

Dr. LORY MARSH—On Idiopathic Abscess of the Brain.

Dr. GEORGE BUCHANAN—On the Treatment of Elephantiasis by Ligature of the Main Artery of the Limb; with a Case in which cure was effected by Ligature of the External Iliac Artery.

Dr. S. GORDON—On Cerebro-Spinal Fever.

HENRY THOMPSON, Esq.—Considerations suggested by the Study of One Hundred Cases of Stone in the Bladder of the Adult, recently operated on.

Dr. W. PIRRIE—On Acupressure.

Dr. C. FLEMING—On the Surgical Pathology of the Urine.

Dr. F. R. CRUISE—On the Endoscope.

J. TUFNELL, Esq.—On Stricture of the Rectum.

H. LEE, Esq.—Modern Views on the Pathology and Treatment of Syphilis.

Dr. KIRKPATRICK—Treatment of diseased Joints by Escharotics.

Dr. RAWDON MACNAMARA—Ligature of the Femoral Artery according to the Plan of the late Professor Porter.

Dr. HINGSTON (Montreal)—An Operation for the Relief of Deformity from Disease of the Hip-joint.

Dr. F. CHURCHILL—Granular Endometritis.

Dr. ALTHAUS—Electrolysis of Tumours.

Dr. GREENHALGH—Cæsarean Section.

Dr. HAYDEN—Diagnosis of Functional Cardiac Murmurs.

Dr. DENHAM—The Use of Ergot of Rye.

Dr. O'LEARY—Animal heat.

Sir J. Y. SIMPSON—The Cephalotribe.

Dr. RINGLAND—Cases illustrating the Use of the Cephalotribe.

Dr. MCCLINTOCK—The Spontaneous Elimination of Fibrous Tumours of the Uterus.

GEORGE SOUTHAM, Esq.—Three Cases of Spontaneous Fracture of Urinary Calculi in the Bladder.

Dr. AVELING—Pelvi-Uterine Mensuration, by means of combined sounds.

Dr. ASHE—Suggestions for the Improvement of the Medical Profession.

Dr. MAPOTHER—The Topography of Cholera.

Dr. MAPOTHER—Treatment of Aneurism; Advantages of completely arresting the Current through the Sac.

P. C. LITTLE, Esq.—Experience of Cholera during the late Epidemic; with cases.

Dr. HALTON—Cases in Practical Medicine.

Dr. M'GREEVY—Remarks on the Nature, Symptoms, and Treatment of Cholera.

Dr. HENRY KENNEDY—Are the Types of Fever Limited?

Dr. G. PATON—Researches on the Action of the Heart.

Dr. LEARED—On the Successful Use of Arsenic in Certain Painful Affections of the Stomach.

J. Z. LAURENCE, Esq.—A Case of Traumatic Aneurism of the Orbit, in which the Common Carotid Artery was successfully Tied.

J. Z. LAURENCE, Esq.—Further Experience on Removal of the Lacrymal Gland as a Radical Cure of Lacrymal Disease.

Dr. H. COLLIS—The Treatment of Tumours by Electricity.

Dr. MACKINDER—On Fistula in Ano.

Dr. SHINKWIN—On Hydrophobia; its History, Pathology, and Treatment.

Dr. BRAXTON HICKS—To exhibit a Cephalotribe, with Remarks.

Dr. KIDD—To exhibit a Cephalotribe; with Remarks.

Dr. DALDY—On Hysteria treated by Strychnia.

ELECTION OF M. WURTZ.—At a meeting of the French Academy on the 15th inst., M. Wurtz was elected to the place lately vacated by M. Pelouze in the Section of Chemistry.

Review.

THE HALF-YEARLY ABSTRACT OF THE MEDICAL SCIENCES, &c. Vol. XLV., January—June, 1867. London: Churchill.

THIS most useful book, of old known to the Profession by the name of "Ranking's Abstract," also furnishes evidence of the influence and value attached to the papers of many of our best known contributors, whose labours are marked out in an honourable manner in its pages. In the current number we find abstracts from the following papers, which originally appeared in our columns :—

Ward, Montgomery Albert, M.B.—A case in which Typhus and Pythogenic Fever co-existed, complicated with Pleuro-Pneumonia.—13th February, 1867.

Lane, Alex., M.D.—Cholera.—20th March, 1867.

Moore, Wm., M.D.—Hepatic Abscess, simulating Abdominal Aneurism.—23rd January, 1867.

Sandham, Mr. W. H.—Cases of Intestinal Obstruction; illustrating the value of Opium as a remedy.—16th January, 1867.

Belcher, T. W., M.D.—Psoriasis.—6th February, 1867.

Drysdale, Dr.—Tinea Decalvans.—10th April, 1867.

Tyrrell, Mr. H. J.—On the Treatment of Delirium Tremens by Indian Hemp.—13th March, 1867.

Croly, Mr. H. G.—Acute Glossitis.—6th February, 1867.

Hinton, Mr. J.—On the present Methods of Diagnosis in Aural Surgery.—15th May, 1867.

Pollock, Mr.—Enlarged Scrofulous Glands, displacing the Aorta and Innominate Arteries.—22nd May, 1867.

REGISTERED FOR TRANSMISSION ABROAD.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 24, 1867.

THE ROYAL COLLEGE OF PHYSICIANS OF LONDON.

WE have urged, temperately and respectfully we trust, but still deliberately, that it is an act of injustice on the part of those who sway the Councils of the London College of Physicians, to allow many of the senior Members to remain, year after year, in a position of implied inferiority. Such an imputation can, by no means, surprise some of the elder Fellows of the College, for if our memory serve us correctly, in the year 1833, long and ill-suppressed feelings of vexation, compelled many of the then Licentiates to appeal to both Houses of the Legislature.

The College may affect to ignore this fact, as they certainly seem to have forgotten the admonition then received from Lord Chief-Justice MANSFIELD, to amend their bye-laws.

If discontent were manifested so unmistakably at this period at the dealings of the College (then tight-laced by prestige and routine), how much more loudly should the watch-word of *Reform* resound to-day.

During the year 1859 (of grace so called, though some might demur to the term), the College admitted many hundred Graduates of almost any and every University, on payment of a small fee, and without any form of examination whatever. So far —so well. We rest upon this step, not as one in any sense disparaging to the Graduates so admitted, but to signalise it as a great transition era in the history of the College, one in striking contrast to all its traditions, and to all its prior practice; many had thought great changes were at hand, its very Hall seemed redolent of Liberality and Progress. Alas! for human inconstancy. Collegiate Liberality seemed exhausted in this act with, even yet, faint signs of animation, while the Members suffered from the well-known ill that waits on "hope deferred."

At such a crisis, under such an innovation, it would probably have been considered a just act—certainly a graceful one—on the part of the College, to have given a step in promotion to the majority of its original Licentiates, who had both paid a large fee and undergone a long examination. Many of these were men of unquestioned loyalty, proud of their connection with the College, jealous of its reputation, trusting in its justice, and ever inspired with the belief that an honourable career would, in the fulness of time, have earned the reward of the Fellowship. But, mark the result! Not only have these men been required to alter their former title of "Licentiate," and to be incorporated with the present huge list of "Members," but they have been annually neglected, their former status ignored, while the Fellowship has been frequently bestowed upon Members admitted during the year of grace, and, subsequently, without any such claim to priority, in many cases, as would satisfy the Profession generally, who cannot be supposed devoid of a very direct interest in the proceedings of an Institution which *ought* to rank as the acknowledged head of scientific Medicine in this Metropolis.

It is our duty, as Medical Journalists, to point out unreservedly all such backslidings as tend to mar efficiency, and lead to a totally false estimate of the Professional value of the Fellowship of the Royal College of Physicians. But we stem so ungenial a current of reflection, and gladly turn towards a safer resting-place.

We only find safe anchorage amid the Liberal section of the Fellows. Around them alone our latest hopes now cluster. May men whose talent sheds the *true* lustre on the body to which they belong (beside which all empty exclusiveness effectually pales), by their future government, free their College from the reproach of partiality and injustice!

THE BRITISH MEDICAL ASSOCIATION IN DUBLIN.

In another column our readers will find the authorized programme of this Medical Congress.

We shall use every exertion to provide the Profession with a report of the proceedings as they occur, and we intend in due course to make editorial remarks on the meeting and its results to our Profession in Ireland. We may just now advert to a few points which are not contained in the published programme.

The Public Dinner will occur on the bi-centenary of the College of Physicians of Ireland, who, on the 8th of August, 1667, obtained their first charter of incorporation from King CHARLES II., having for thirteen years before that time existed as a collegiate body in the University of Dublin (as the School of Physic practically is at present), under the name of Trinity Hall, the memory and foundation of which, and of the Irish College of Physicians, are inseparably connected with the name of Dr. STEARNE, a practising Physician in Dublin, and a Senior Fellow of Trinity College, who was the "*fons et origo*" of both institutions.

The Excursions on Saturday, the 10th August, are well arranged; and we are informed that one of them—that to the River Boyne and its historic neighbourhood—will be conducted under the able and peculiarly suitable leadership of Sir WILLIAM WILDE, who wrote years ago on "the Beauties of the Boyne and the Blackwater."

Lastly, the Senate of the University of Dublin intend to confer honorary degrees on some members of the Association; and it is considered probable that the College of Physicians of Ireland will confer an analogous distinction—their Honorary Fellowship—on others.

LEAVE OF ABSENCE TO DISPENSARY MEDICAL OFFICERS.

WHEN DANIEL O'CONNELL said that Corporations have no consciences, he uttered a truism which all experience before and since his time has endorsed and confirmed.

This is now and again seen to be particularly the case with Boards of Guardians, or rather with the ignorant majority of many of them. Cases there are, indeed—"*rari nantes in grugite vasto*"—where an unwonted liberality to our Profession shines forth among a motley assemblage of Poor-law Guardians of all sorts and conditions of men; but this generally arises, not from an unanimous conviction of the justice and good policy of the thing, but from the strong influence exercised over his brother guardians by some Poor-law Guardian who has both the will and the power to do, and make others do, what is right towards the hard-worked Medical Officer.

In another column we give our readers extracts from the *Irish Times* and *Express* newspapers respecting the hard usage meted out to Dr. WHISTLER, of Bray, by the Rathdown Guardians. Dr. WHISTLER gets ill in their service, and gets leave of absence because of his illness. He is, however, told by the ignorant and narrow-minded majority whom he has the misfortune to serve, that he must pay his deputy himself; and this notwithstanding the express recommendation of his own Dispensary Committee to the contrary, and the certificates of Drs. STOKES, HUDSON, and M'DOWELL, as to the urgent necessity for his obtaining sick leave. There is no use in arguing about the monstrous injustice and the miserable cruelty of this conduct. Every one can see that it is a wretched attempt to pay off Dr. WHISTLER for his success in the recent case of DEASE *v.* WHISTLER, wherein he taught some of these Bray Guardians to mind their own business, and not meddle with his professional character. This resolution of the Rathdown Guardians will and must be looked on by an indignant public as a mere personal squabble of the most pettifogging description, arising out of the above-mentioned law-suit, and will be met accordingly.

Questions of this kind should be settled on the merits, and not on any personal grounds. The hitherto invariable usage—that when a public officer gets ill because of his public duties, his deputy should be paid by the public—should be decided to be a definite rule by the Poor-law Commissioners, to whose sense of justice we leave the case. We believe they have the power to *compel* recalcitrant Guardians to act fairly towards their salaried officers; and we have little doubt of the result in this case.

In point of fact, it appears to us that Dr. WHISTLER committed an error in asking permission, when the explicit regulations conferred the remission of his duties as a right. The Rules provide that a Medical man who, from illness, may be incapacitated from continuing to carry out his duties, must notify the fact to his Committee, and suggest some one to act as his *locum tenens*. Having done this, the Guardians must either accept the suggestion and, if necessary, pay the substitute, or leave the position vacant. They have *no power whatever* to curtail the salary of the sick Doctor.

A great principle is involved in the issue, and we are quite satisfied that the Commissioners will consider the question without the remotest reference to the celebrated cause of DEASE *v.* WHISTLER, and the verdict of the jury in that case.

REAPPEARANCE OF TRICHINIASIS IN GERMANY.—It was supposed that trichiniasis had quite disappeared from Germany, but cases have again been observed at Halberstadt. Several inhabitants have suffered, and among them were children three years of age. The police had to protect the butcher who had sold the trichinosed pork.

Notes on Current Topics.

THE QUEEN'S HEALTH.—It would seem that the oracular announcement made by the *Lancet* last week, to the effect that her Majesty the Queen suffers habitually from "restless nights, most distressing sick headache, and great exhaustion," demands some more tangible corroboration than the indefinite would-be-official phraseology in which it is couched. The inquiries which we have made have not enabled us to ascertain that there are any reliable grounds for this very alarming statement, and we are earnestly anxious that the *Lancet* should either favour the expectant public with some of the further details which are supposed to have been exclusively communicated to it, or should verify the mysterious whispers of which it claims to be the favoured depository with an authenticity somewhat more real than its very indefinite forewarnings indicate. On such a subject as the health of the Sovereign, perhaps the public MAY be excused for doubting the uncorroborated foreshadowings of the *Lancet*.

THE BRITISH MEDICAL ASSOCIATION.—The notice paper for the approaching meeting of the Association at Dublin contains two motions which are likely to give rise to an animated debate. Dr. J. Seaton will move—To substitute for Law 1, "That the Association shall be called 'The Medical Association of Great Britain and Ireland,' or 'The Medical Association of the United Kingdom of Great Britain and Ireland.'" We hope to receive, from the statement of Dr. Seaton in regard to the foregoing resolution, some enlightenment as to the grounds for its adoption. We shall be curious to learn in what respect the British Medical Association would claim to represent the profession in Ireland? If as a peripatetic, scientific congress, for encouraging the progress of medicine and surgery, well and good; if as a medico-political body, we venture to suggest that the annexation of Ireland can be nothing but respect of an empty name. Neither in social status, in the objects which it has in view, or the means in which it proposes to carry them out, can the present organisation of the Association serve the purpose of any but a small minority of the profession in Ireland. The Rev. Dr. Bell will move—"That it is inexpedient to make such extensive changes in the form and conduct of the JOURNAL, as have just been made, without the consent of the members assembled at an annual meeting." Dr. Bell will also ask this question—"Why are the subscriptions of members directed to be paid to the Secretary and not to the Treasurer?" and will ask leave to move a resolution, if he think the reply requires that he should do so. The Profit and Loss Account of the Association, never indeed a very pleasant point of view of the annual proceedings of the Association, may this year furnish the Rev. Dr. Bell with some forcible arguments. If, however, the operations of the conductors of the Journal should present a good monetary result, the resolution will, we think, meet with little support. We have always considered the publication of a journal as a perversion of funds which might have been employed with infinitely greater advantage to the Profession and the Association, but we are bound to say, nevertheless, that the present administration has hitherto evinced an unwonted vigour which, if it be financially successful, fully authorises the action which may have been taken.

THE RICHARDSON TESTIMONIAL.—The Society for the Prevention of Cruelty to Animals, has voted £25 to be added to this fund, or to be used in any other manner that may be thought preferable, as a testimony to Dr. Richardson's services in bringing into general use his method of inducing local anæsthesia, which is as applicable in veterinary as in human practice.

COLNEY-HATCH ASYLUM.—There were on the books of this asylum at the close of last year, 823 men and 1215 women. The establishment is capable of holding 830 of the former and 1225 of the latter. The mortality of the patients treated at Colney-Hatch is eleven per cent. The chief causes of death are consumption and general paralysis. No epidemic has lately prevailed. Patients from districts suffering from cholera were usually refused admittance. The Commissioners in Lunacy recommend several improvements, and state that steps should be taken immediately to provide further accommodation for the pauper lunatics of the County of Middlesex. The Commissioners also report that the Medical Staff is insufficient. There are only two Medical Superintendents and two Assistant Medical Officers, in charge of these 2038 patients. We have often inveighed against the impropriety of overworking medical men in this manner, and would once more urge the iniquity of thus setting the Superintendents to do impossibilities. The least thing that goes wrong at once causes an outcry against the doctors; but what reasonable man would expect any one Medical Superintendent to have an eye, day and night, upon every act of a thousand lunatics?

ORPHAN ASYLUMS.—In the course of a capital speech at the opening of the Alexandra Orphanage, Lord Granville drew attention to the evils that accompany the mode of election to these charities. It is, indeed, a discredit that the orphans who are fortunate enough to be admitted are not the most needy, but those who have secured the support of the most active busybodies. It is a case parallel to that of election of Medical Officers to our hospitals. It is easy enough to point out the folly of the existing modes of election, but by no means so easy to devise a good system. The difficulty of doing so is, in fact, the only reason why the present absurd methods have not long since been swept away. There are vacancies now in London, the candidates for which, we have reason to know, are fully sensible of the folly of appealing to a set of people who cannot be any judges, and who would gladly hail some just method of considering their claims, and avoid the exhibition of a contest.

BROMIDE OF POTASSIUM.—Some experiments on animals have lately been made with this drug. According to Eulenburg and Guttmann from thirty to forty grains administered to dogs by subcutaneous injection, produce cardiac disturbance, together with diminution of sensation and voluntary motion. In a period varying from ten to thirty minutes this state ended in complete paralysis of the heart. This mode of death was constant in a large number of animals, and the results must, therefore, be looked upon as of considerable importance. The bromide is now, by some practitioners, so constantly—we had almost written indiscriminately—prescribed, that there ought to be no difficulty in corroborating or refuting these statements as to its properties. Yet the action of drugs seems almost a for-

gotten subject of investigation. It is strange that while thousands of our brethren are daily prescribing drugs so few really reliable contributions should be made to our knowledge of their properties.

TOBACCO.—In a paper lately read before the Medico-Chirurgical Society of London, Mr. Hutchinson expresses an opinion that the abuse of tobacco by smoking, gives rise to a considerable amount of nervous disease of the eye. In France the same habit has lately been denounced as the origin of mental diseases and various nervous disturbances.

THE FOLLIES OF FASHION.—The last freak of fashion is to give the *coup de grace* to the pearl-powder, white-lead, and rouge that have so long reigned. Even belladonna is to be discarded, and "golden" hair will shortly be as rare as the real auburn tint of nature, if not still rarer. The decree has gone forth for black hair and bronze complexions, and these will, no doubt, shortly crowd the parks. How they are produced is the only question that need concern us. The destructive nature of the chemical agents usually employed for dying the hair black is well-known to our readers. To give a lady of fashion the complexion of a gipsy, nothing is needed but a little walnut-juice, and we have reason to know that this has already found its way to the toilet-table. It has at least the negative merit of not being so dangerous as some of the poisonous cosmetics that have preceded it. Whether a dirty face will long be the rage, it would be rash to predict.

RELATIVE MORTALITY OF BACHELORS AND MARRIED MEN.

THIS subject, which was started some time ago by the Scotch Registrar-General, and has more than once appeared in our columns, is again alluded to in the Annual Report of that functionary just issued. The subject is one that can scarcely be otherwise than interesting, even to those who take but little pleasure in the study of statistics. Moreover, it is one likely to cause great diversity of opinion amongst superficial thinkers, and is sure to point many a sally against the power of statistics to prove anything.

Let us hear then, first of all, the conclusions of the Registrar-General for Scotland. He says that :—

"Carefully ascertained facts applicable to the whole male population of Scotland who are above 20 years of age, and for a period of two years, seem to prove that the married state is the condition of life best fitted for mankind, and that, at every successive stage of life, married men die at a much lower rate than unmarried men of the same ages. It seems impossible, therefore, to avoid drawing the conclusion, that it is to marriage, and the more regular domestic habits which attend that state, that this result is attributable. Were this conclusion based on small numbers, or on the statistics of a particular class, or on the comparison of the mortality of married or unmarried men during the earlier years of life (as below 40 years of age), doubts might rest on the conclusions deduced. But whether the explanation attempted to be given be satisfactory or the reverse, the fact itself must remain unchallenged, that at every successive stage of life, up even to extreme old age, married men die in a much lower ratio than those who are unmarried. It is a known fact, that at the earlier ages, say from 18 to 40 years, among the unmarried are a considerable number of men who, from natural infirmity, delicacy of constitution, the existence of chronic disease, bad health, or from being addicted to dissipated and licentious habits, or by want of success in life, do not marry. The annual mortality among such men is annually greater than among the strong and vigorous bachelors ; and this greater mortality among such unmarried men to some extent swells the proportional deaths of the unmarried at these early ages, as compared with those of the same age who are married. But almost all such die out, by the course of nature before they have attained their fortieth year—none survive their fiftieth year. But the tables for the two years prove that at every successive year of life, from 50 to extreme old age, the married men continue to die at a much lower ratio than the unmarried who were of the corresponding ages. Thus, even at the great age of 70 to 75 years, in every thousand married men only 81 died, but in every thousand unmarried men at the same ages 102 died annually. No arguments can explain away this ascertained fact. And as the sole difference in the two parties at every age above 50 years of age is that the one is married and that the other is unmarried, it seems impossible to resist the conclusion that it is marriage, and the habits connected with marriage, which is the cause of the difference. Strange it is that it is only now, after the lapse of several thousands of years, that statistics have proved the truth of one of the first natural laws revealed to man—'It is not good that the man should live alone.' The above conclusion relative to the much smaller death-rate of the married men is strikingly confirmed by calculating the mean age at death of the married and unmarried men above 20 years of age. From the facts published in Table XVIII. of the Ninth Detailed Annual Report, it was ascertained that the mean age at death of the married men was 59·7 years, whereas the mean age at death of the uumarried men above 20 years of age was only 40 years—giving a difference of 19½ years in favour of the married men. Calculating the mean age at death in the same manner for the year 1864, it appears from the facts stated in Table XXX., that the mean age at death of the married men was 59·1 years, whereas that of the unmarried men who were above 20 years of age was 40·2 years—showing a difference of 19 years of life in favour of married men."

The mode in which these conclusions are worked out is worth consideration. In the present article we can, however, only give a few of the figures, by way of example. Above the age of 85 the numbers are too few to yield any result that could command confidence on almost any subject. The other extreme of youth must also be omitted, so that no calculations have been attempted for persons under 20. We think, however, that even from 20 to 85 includes rather too many people for a just investigation of this subject. We will, nevertheless, give a few of the results obtained, since, from some cause or other, it would appear that there has been in Scotland a larger mortality of bachelors than married men, during each quinquennial period from 20 to 85. Thus, we learn from this authority, that between the ages of 20 and 25 years, in every thousand married men only 6·26 died annually, but in every thousand unmarried men at the same ages, 15·01 died. From 25 to 30 years of age, only 8·23 per thousand died annually in married men, but 14·94 per thousand unmarried. From 30 to 35 years of age, only 8·65 died in every thousand married men, but 15·94 in every thousand unmarried. From 45 to 50 years of age, in every thousand of each class, only 17·04 married, but 21·18 unmarried died annually. In every thousand of each class from 50 to 55 years of age, 19·54 married men died annually, but 26·34 unmarried. In every thousand of each class from 60 to 65 years of age, 35·63 married men died annually, but 44·54 unmarried men. In every thousand of each class from 70 to 75 years of age, 81·56 married men died annually, but 102·17 unmarried men. Between the age of 80 and 85 years, the annual mortality of the bachelors was 195·40 per thousand, while that of married men was only 173·88.

Nor do these figures represent one exceptional year, since they are in fact the mean of the years 1863 and 1864. It may be that the succeeding years may not yield the same results, and that some particular cause at work during that period may yet be seen. It is quite possible that, after all, the figures should be the consequence, not of marriage, but of some other unrecognized agency. We do not propose on this occasion to inquire into the possibility of this, but only to signalise the interesting social question suggested by these registration returns. There can be little doubt that statisticans, in all parts of the kingdom, will sift the figures in every possible manner.

DURING the half year ending June 30th, 219 women were delivered in the City of London Lying-in-Hospital.

THE LATE SIR WILLIAM LAWRENCE, BART., F.R.S.

IMMEDIATELY upon the decease of the venerable Sergeant-Surgeon to the Queen, we gave a brief notice of his life in which the motto *de mortuis nihil nisi bonum* was evidently acted upon. It could be of no possible interest to our readers to re-open a controversy long since exhausted, nor was it necessary for a journal that had so long consistently opposed Lawrence during his public career, to carry on a personal warfare after his decease. It seemed to us preferable to do him the honour due to his undoubted genius, and turn the force of our arguments against those opponents who survive, and may, therefore, reply or be convinced. It would have been difficult for us to write a full life of him without sad references, and some of these disputed points played so important a part in his career, that in such a case they must have been alluded to. But, fortunately, this less genial part of our task had already been done. A long consistent course has characterised this journal, and everything that need have been said, had been repeated over and over again, so long as any hope of doing good by the repetition existed. We had therefore only to sum up the later events of Sir William's career, and turn to other subjects.

On the same day as that on which we published our brief obituary paragraph, there appeared in the *Times* a notice of the deceased baronet, which has given rise to a somewhat unusual controversy in the columns of that journal. The writer of the notice having mentioned the discussion that arose on the publication of Lawrence's Lectures on "Zoology, and the Natural History of Man," and his promise to suppress the book, went on to say, that "he kept his word, so far as withdrawing the obnoxious works from circulation in this country, but sold the entire edition to the notorious Carlile, of Fleet-street, a publisher of seditious and blasphemous works, by whom the books were sent to America."

Upon this Sir Trevor Lawrence, the present baronet, the son in the medical profession to whom we alluded the other week, wrote to the *Times* denying the accuracy of the statement, explaining that Carlile's edition was in reality pirated, and that his late father had, in fact, unsuccessfully taken legal proceedings to prevent its sale. The "writer of the notice" in the *Times* at once replied, saying that "the sale to Carlile took place before Sir T. Lawrence was born, and that consequently his knowledge of the transaction must be very imperfect." He then asserts that he "made the statement on the authority of Mr. Carlile, communicated shortly before his death," and adds that it was "repeated in company by the late Dr. Lynch." The writer draws attention further, to the fact that similar statements have long since been in circulation, and have remained unchallenged, giving references, and then specially observing that "perhaps the best notices appeared in the MEDICAL CIRCULAR of March 1854," which he recommends those interested in the subject to peruse. Of course so flattering a testimony from a writer in the *Times* at once creates a desire in the minds of hundreds to see the articles alluded to. They were published years before the amalgamation of the MEDICAL CIRCULAR with the MEDICAL PRESS; were three in number, and constituted a complete biographical sketch of Lawrence up to that date. As they cannot fail to be deeply interesting, and as the numbers for March 15th, 22nd, and 29th, 1854, in which they appeared, are now out of print, we reprint the principal passages in this week's MEDICAL PRESS AND CIRCULAR.

We must premise, however, that Sir Trevor has repeated his contradiction of the statements in the *Times* "on the unimpeachable authority of his father's private memoranda, which show conclusively that the bulk of the suppressed works remained in his possession long after the publication of Carlile's pirated edition." He mentions also that, to his own knowledge, a considerable number of copies remained in his father's possession as late as 1855.

The writer in the *Times* nevertheless wrote on the 18th inst., refusing to retract any of the assertions. It is not our object to enter into this controversy. The republication of the prior article in this number is undertaken with no wish to reiterate its sentiments, nor should we desire at this date even to endorse everything it may contain.

Lawrence! This word is the mystic *Omh* of the profession's faith. What does it portend? Its inner meaning, its outer influence, what are they? Is it divine or factitious, a type of the true, or an emblem of the false, the transitory, and the conventional? The word is a charade: each half has its own meaning, and the whole makes a character contradicting its two halves. Who can understand it?

A duplex character is often misapprehended; and is at one time the sport of faction, at another the sacrament of idolators. Abused yesterday and eulogised to-day, the world grows sceptical of its virtue, and regards abuse and eulogy with equal mistrust. A writer who had caught his inspiration from the *Lancet* might speak of the great surgeon somewhat in the fashion a believer would denounce a heretic, and might describe him in terms such as we will now attempt to translate into the more polite language of our own vocabulary.

Lawrence in youth, the free-thinking, the bold, the defiant, the render of musty parchments, the denouncer of old abuses, the sneerer at ancient reverence, the crusader fighting without a creed bearing a cross to the walls of Jerusalem, scaling them alone, and then sitting down with the muftis under the shade of the crescent's golden folds. Lawrence in later life, the discreet, the conformable and reserved, the admirer of everything past except his own career, the sustainer of law, to whom all change is destruction, all novelty anathema, who rolls himself up comfortably in the mantle of his own esteem, and warms himself at the flames of sycophancy and adulation; who, sooner than consent to wise council and popular will, stands like Sardanapalus upon a pyre of mildewed charters, and waits for the torch to be applied, that he and they may be consumed in one heap. Yet, we doubt that he aspires to the glory of martyrdom. See him, he mounts the faggots, arranges his robe gracefully, addresses the spectators with an eloquence, by turns tender, taunting, and sublime; but the smoke ascends; all hearts are anxiously waiting the glorious consummation, and Lawrence like a mock hero, escapes down the back steps and is off by the wings, laughing in his sleeve at the dexterity with which he has humbugged the innocents.

However various, Lawrence is, nevertheless, Lawrence still. The poles of his character have one centre—self. Like a heathen idol he has many faces, a man's, an eagle's, a serpent's a cat's, but they are all hewn out of one block. On one side he is the type of energy, on another of discretion, on a third of prescience, on a fourth of cunning; but as the idol is a god, so is Lawrence a philosopher.

Had Lawrence not been a philosopher, the worship offered to him would long since have ceased. A man who has openly defied consistency, and treated public opinion—the oracle of our day—with as much contempt as Demosthenes the oracle of his, cannot retain either popular or private respect unless there be something in him to which the mind of others is constrained to bow, even while it demurs to the humiliation. Lawrence has intellect—an intellect, cold, hard, strong as steel, yet glittering on the surface like steel when the light plays upon it—an intellect that reigns tyrannically in its little court, strangles with an iron grip the impulse that comes unbid, smiles ironically at the emotions that rise lovingly in the heart, makes a wide waste around its throne, and rejoicing in its strength points at desolation as the symbol of its dominion. Such *might* be the *Lancet's* sketch—now to our own.

William Lawrence was born at Cirencester, in Gloucestershire, in July, 1783, where his father practised as a surgeon for very many years. Having received the usual preliminary education in his native town, he was sent by his father, in 1799, to reside with Mr. Abernethy, whose pupil he became. Young Lawrence soon displayed the abilities which have since distinguished him, and being industrious and accommodating, won the favour of his illustrious preceptor, who, after he had been three years a pupil, appointed him demonstrator of anatomy at St. Bartholomew's Hospital. He thus began to teach at an early age, but his assiduity and talent justified the selection, which the favour of his fellow-students also ratified. Mr. Lawrence continued to perform the duties of demonstrator for twelve years. He passed the College of Surgeons in 1805. In March, 1813, he became assistant-surgeon to St. Bartholomew's Hospital, and in May, 1824, one of the principal surgeons. Mr. Lawrence has therefore been officially connected with the hospital for a period of *fifty-two* years; a sufficiently long lease of advantages to make retirement an act of decency and justice. But Mr. Lawrence, like all politicians, values *position*, and he will probably never relinquish office until he discards practice, or until some extraordinary rebellion occurs in the Board-room of the Hospital.

Complaints, not loud but deep, have been made against him for his unrelaxing tenacity of office; and there are many men at this moment at St. Bartholomew's who would throw up their caps and sing a pæan on hearing that Lawrence had resigned. Some of his most ardent admirers consider this to be his only fault. Generous spirits! Certainly there is a time when the dim eye and the faltering hand require exemption from duty, and when that period comes, resignation of office is merely an act of justice. But it would be difficult to persuade Lawrence that this period had arrived in his instance; and we must confess that, though bending under the weight of advancing years, he looks greenly and freshly, and doubtless considers himself to be still "every inch a surgeon." These matters should not, however, be left to the option of individuals, but decided by the rules of each institution. After sixty-five a man should retire from active duty.

In 1813, Mr. Lawrence became a Fellow of the Royal Society; in 1814, surgeon to the Eye Infirmary; and in 1815, surgeon to the Royal Hospitals of Bridewell and Bethlehem. He was appointed in the latter year one of the professors of anatomy and surgery to the College of Surgeons, an office he held for four years. He also lectured on Surgery in the Aldersgate-street school, for one session, 1826–7; retiring from it in 1828–9, to succeed Mr. Abernethy in the lectures on Surgery, at St. Bartholomew's Hospital.

In his introductory lecture, delivered at the College of Surgeons, Lawrence eulogised Abernethy as became a modest and grateful pupil; he especially adverted to his "invariable kindness," "disinterested friendship," "benevolent and honourable feelings," "independent spirit and liberal conduct," "which, while they dignify our profession, win our love, and command our respect for genius and knowledge, converting these precious gifts into instruments of the most extensive public good." Thus in a magniloquent sentence, more sincere we trust than grammatical, Lawrence extolled the virtues of his teacher, Abernethy; but the veneration was not of long continuance, and within a very few years from that time, a literary controversy arose between the master and pupil, in which sarcasm was substituted for compliment, and contempt for admiration.

Lawrence's manner as a lecturer was a model of art. No man of his day excelled him; Green alone was his rival. We do not speak of Cooper or Abernethy, each of whom was a genius, and a law to himself. Lawrence owed more to culture, and studied all the turns of language and refinements of style which give a classic finish to rhetorical composition.

We allude more especially to his introductories and orations. In these he attended not more to the matter than he did to the delivery, and he desired less that the latter should be striking, than that it should be correct, graceful, and faultless.

. . . . . .

When it was known that Lawrence was going to lecture, every idle man in the profession flocked to the theatre. The desk became a throne, and Lawrence was crowned with acclamation. He was greater here than even in the operating room, because he had more opportunity of exhibiting the riches of his intellect, the versatility of his nature, the depth and variety of his researches, the acuteness and vigour, the grasp and breadth of his understanding, the boldness of his reasonings, and the felicity of his cultivated diction, all set off and illustrated by a face and figure which threw new charms around his discourse, and elicited the involuntary plaudits of his hearers. Even his ordinary lectures at the theatre of the hospital were an attraction to students from all the other hospitals in London. "Let us go and hear Lawrence," was a common phrase, and he who returned to his native town after a winter session, without having once heard the "great gun" of St. Bartholomew's was regarded as a man of little curiosity or taste. A St. Bartholomew's man would certainly hold such a one in considerable contempt.

Mr. Lawrence became an author at a very early period, having published, in his eighteenth year, a translation from the Latin of a "Description of the Arteries of the Human Body, reduced in the form of Tables by Adolphus Murray, M.D., professor of anatomy and surgery at Upsal." His name did not appear on the title-page, but the work was useful to students.

His most important, perhaps his best and most generally renowned work, however, is his essay on the "Treatment of Hernia," first published in 1807, having in the previous year received the prize offered by the College of Surgeons for the best essay on the subject.

. . . . . .

In the same year he brought out a translation of Blumenbach's work on Comparative Anatomy.

. . . . . .

In 1808 he published "Observations on a Peculiar Affection of the Testis, attended with the Growth of Fungus from that Organ," in which this disease was first described.

. . . . . .

In 1809 "Observations on Lithotomy; with the Account of a Case in which the Operation was performed with the Knife."

. . . . . .

His most remarkable works are, however, "An Introduction to Comparative Anatomy and Physiology, being the Introductory Lectures delivered at the Royal College of Surgeons, on the 21st and 25th of March, 1816," and "Lectures on Physiology, Zoology, and the Natural History of Man. Delivered at the Royal College of Surgeons, 1819."

. . . . . .

To come out of such a struggle with success, Lawrence knew that he must exert all his faculties, and he, therefore, had recourse to every art of the rhetorician. Arguments, vigorous and close; eloquence, voluminous and stately, are employed by turns, and, when they are felt to fail, insinuation and sarcasm glance from the glowing pages. Since this period, however, Lawrence's manner has changed; he has dropped his sarcasm and his rhetoric, and writes and lectures in a plain, simple, yet withal, agreeable and easy style.

What is life? Now-a-days, one is surprised that a strife so bitter as that between Abernethy and Lawrence should have been carried on upon the subject of an answer to this inquiry. Abernethy, it is well-known, in one of his prelections before the College of Surgeons, maintained the doctrine of John Hunter; but what that doctrine was, did not very clearly appear. Hunter described his vital principle in this wise: "I consider that *something similar* to the materials of the brain is diffused through the body, and even contained in the blood, between which and the brain, a communication is kept up by the nerves." If the expression be not irreverent, we may be permitted to say that we could as easily extract sunbeams from cucumbers, as an intelligible idea of the principle of vitality from this hazy definition. The vital principle is first *something*, then a *similar* something to the materials of the brain; but how nearly similar or how far dissimilar, and in what respect, does not appear. This "something similar" is diffused through the body and blood, and the nerves are stated to be the communicators of intelligence, sensation, and what not, between it and the brain. This something similar being *the* unknown entity superadded to the demonstrable physical structure, is the vital principle: ergo, this "something similar", being of the nature of the "materials of the brain," must of course be itself material, or it loses its similarity and the vital principle of John Hunter is, after all, nothing but a physical thing, and his physiology a system of *materialism*.

Yet it was not so considered. The fetishism was strong for John Hunter. He was supposed to mean more than he said, and he was set up as the author of a doctrine teaching a refined spirituality. Abernethy stepped forth as his high priest.

. . . . . .

However, Abernethy expounded Hunter's views, and his

pupil, Lawrence, called them in question. The Aristotle and Aristoxenus of medical philosophy join issue, and form rival schools.

. . . . . .

But Lawrence advanced further than this; he said that matter was endowed with *vital properties*—sensibility and irritability, &c.: by virtue of which the phenomena which he called "life" were carried on. Whereas other philosophers regarded life as due to an independent principle, called the *vital principle;* Lawrence viewed it as the result of the action of certain *vital properties* belonging to matter. His vital properties perform the same office as the vital principle of the spiritualists, being the sustainer of life. Plainly speaking, therefore, Lawrence regarded "vitality" as an inherent property of matter.

Lawrence lost himself here; had he been contented with merely giving an accurate definition of the phrases "life," "organization," "function," &c., he might have earned unqualified praise, but when he ventured to determine the nature of vitality, and indulged assumptions which struck a gratuitous blow at the philosophy and the religion of his country, he sacrificed both his character and his logic. As a philosopher he was not justified in assuming what he could not prove. Thus, for the sake of championing a fallacy, he rashly denuded himself of the character of a Christian.

. . . . . .

Abernethy denounced Lawrence as a materialist, and charged him with prostituting his office as Lecturer to the Royal College of Surgeons to promulgate false and pernicious doctrine. Lawrence retorted with skill and eloquence, but he could not repel an accusation which his irreverent mode of dealing with sacred subjects seemed to confirm. That Lawrence is in his heart a materialist we should be sorry to understand, and are unwilling to believe.

Such was this celebrated quarrel. Abernethy anathematised Lawrence in *ex cathedra* sentences, charging him with having a small mind and bad motives; and Lawrence retorted with sarcasm and scorn. From that time forth we suspect that there was no love between them; the master had expelled the pupil from his affections, the pupil disowned the master, and both were too proud to confess to indecorum or error.

. . . . . .

We must, however, hope in charity that, although the intellect was not convinced, the heart was moved. We can scarcely credit the belief, that after Lawrence's protracted and energetic struggle with Abernethy, he could have been suddenly converted from his errors by a simple discussion of the matter in the Board-room of a Lunatic Asylum. His will might bow to authority, but his reason must have risen superior to its edicts. We know not what may be at present his opinion on the subject of these speculations, and it were bootless to inquire. On reviewing, however, the whole of the arguments, we are constrained to avow our opinion that he was pursued with an intensity of rancour far exceeding the grounds of justification derived from the demerits of his reasonings. He was equivocal, but we are willing to believe not intentionally unchristian. He did not positively deny that which Abernethy could not prove.

Lawrence had scarcely cooled after the excitement of his contest with Abernethy when he engaged in a political struggle with the Council of the College of Surgeons, among whom Abernethy's influence was supreme. Whether his political Championship was excited by his personal feelings, as was publicly averred at the time, or whether he buckled on his armour animated by an earnest conviction of the justice of his cause, it is not now easy to determine. The events of his life have not facilitated the formation of a judgment on his motives.

. . . . . .

Desirous of the support of the press, or unable to extricate himself from its embrace, Lawrence associated with Wakley, and for a time they worked together with sufficient amity and concord. Lawrence was general, and Wakley trumpeter of the brigade. The latter drew up in the rear among the awkward squad, for he had not yet had his drilling in medical agitation. He certainly learned his discipline and tactics while fighting under Lawrence; but it must be admitted that he was an apt pupil, and bettered the instruction. We can imagine Wakley's subserviency to his chief at the same time that he was looking out for an opportunity to carry on a little guerilla work on his own account. This was evident at the first meeting. Our business, however, is with Lawrence.

. . . . . .

So much, then, for the great surgeon of St. Bartholomew's. His career is drawing to a close; beginning in a burst of sunshine, it is closing in a fog. Before he had tried mankind he relied upon his own strength, and, true to his convictions, he startled the world with the apparent novelty and hardihood of his doctrines. He threw down the glove to all comers, and gallantly closed with the first champion,—a man of great intellectual strength and high mettle, but the first murmur from the crowd paralysed his spirit. He saw that, even though truth might be on his side, opinion was against him, and, rather than lose possession of the flesh-pots he coveted, he confessed to a creed he had denied, and covered his head with dust and ashes.

. . . . . .

In sketching the career of a man so difficult to understand, and so much vilified as Lawrence, we may not have escaped the charge of having been unjust in some points, and too eulogistic in others: for the first offence we ask forgiveness, for the second we desire that the allegation may continue to be recorded against us, for we would be rather judged as sympathising with intellectual power, than decrying it in a hypocritical and jealous spirit.

Legal Intelligence.

CHARGE OF MANSLAUGHTER AGAINST A HERBALIST.

HOME CIRCUIT—HERTFORD, JULY 16.

ISAAC CHAMBERLAIN, 67 years of age, herbalist, was indicted for feloniously killing one Mary Anne Parish, at Aldbury.

The offence imputed was only manslaughter. The prisoner had for many years carried on the business of a herbalist, and he was also what is called a "quack doctor." The deceased woman had for some years a tumour on her shoulder, and in March, 1866, she consulted the prisoner, who gave her first a mercurial ointment, to which no objection was taken. After this, it was said he had given her a different ointment, which was arsenical, and this, it was suggested, had caused death, by being absorbed into the system. The case for the prosecution was that she became worse after she used this ointment—that is to say, in August, 1866; that she suffered from arsenical symptoms; and that her death, which happened in September, was owing to this cause. It was not disputed that she died with the symptoms of arsenic, nor that there was arsenic in the ointment. The question was whether there was "culpable negligence" on the part of the prisoner in giving it. Dr. Taylor admitted that arsenic was used upon the Continent, and that it had been used in this country until within the last thirty years, when he said it was discovered that it was absorbed into the system, when it was discontinued in this country, though it still was used upon the Continent. The foreign practitioners, he said, were a little more given to a bold system in cases apparently hopeless, and a little more disposed to what he called "heroic" treatment—that is to say, treatment in which the medical practitioner, for the sake of the patient, runs some risk—than our English practitioners, who, he intimated, were rather more cautious in such cases. Another point on which the case turned was as to the prisoner not having warned the deceased as to the necessary effect of the arsenic when absorbed into the system. This, it will be observed, struck the learned Judge as the most serious part of the case, in the absence of any proper directions or warnings to the patient as to the care with which the ointment should be used. As to this, it did not appear that the prisoner had given any particular directions beyond telling her to "rub some of the ointment in;" and the woman, thinking that the more she rubbed the better, had rubbed so much of the poison in that she died; and the prisoner had sold her another box of the ointment without, as it appeared, making any observation as to the effect of the other.

Mr. Serjeant PARRY, in defence of the prisoner, acknowledged that his learned friend, Mr. Garth, had conducted the prosecution with great candour and propriety, and he endeavoured to make out that it was a case of a mere blunder or error, and not a case of negligence so culpable as to be criminal.

Mr. Justice BLACKBURN, in summing up the case to the jury, said that if the prisoner by culpable negligence had caused the death he was guilty of manslaughter; but the mere fact that death had occurred through mistake or misfortune would not

be enough, or no medical man would be safe. There must, however, be competent knowledge and care in dealing with a dangerous drug, and if the man either was ignorant of the nature of the drug he used, or was guilty of gross want of care in its use there would be criminal culpability. In the one case there would be culpable rashness in using so dangerous a drug in ignorance of it; in the other case there would be culpable want of care, or culpable carelessness in the use of the drug; and in either case that would be culpable and criminal negligence, which would justify a conviction—supposing the jury satisfied that the death arose from the arsenic. The first question was whether the death was caused by the arsenic administered by the prisoner, upon which, however, he thought the evidence strong. The real question would be one of culpable negligence, which resolved itself into the two questions he had explained. He could not define the nature of "culpable negligence" otherwise than as he had described it. It was a question for the jury, for it was a question of degree. It was a question of more or less, and it could not be defined. All the direction he could give them was, that if the prisoner administered the arsenic without knowing or taking the pains to find out what its effect would be, or if, knowing this he gave it to the patient to be used without giving her adequate directions as to its use, there would in either view be culpable negligence, and the prisoner ought to be convicted; otherwise there would not be such negligence, and the prisoner ought to be acquitted. The most serious part of the case was in the apparent absence of cautions or directions to the woman as to the use of the arsenical ointment, the effect of which it was well-known was that it would be absorbed into the system so as to cause death. It was said that foreign doctors used it; but if so it might be presumed that they watched its use with care. And it appeared to him that a medical man who should administer such a drug, or allow a patient to apply it without taking any care to observe its effects or guard against them, would be gravely wanting in due care. Whether, under the circumstances, it amounted to culpable negligence was, he repeated, for the jury.

The jury, after a brief consideration, returned a verdict for the prisoner.

Correspondence.

THE ICE-BAG.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In a letter with the above heading, which appeared in THE MEDICAL PRESS AND CIRCULAR, on the 3rd inst., "Pro Bono Publico" asks whether the application of the spinal ice-bag is likely to be as efficacious in the treatment of "the sickness attending a bilious attack," as it is in cases of sea-sickness. I beg to say, by way of reply, that I have already proved its efficacy in several cases of sickness attending bilious attacks; but the cures were not effected by merely treating the sickness during the period of the attacks: the sickness was rather *prevented* than arrested. I should as soon think of curing epilepsy by treatment restricted to the period of the paroxysm, as I should of curing "sick headaches," or "bilious attacks," by treatment restricted to the period of sickness. They, like the paroxysms of epilepsy, are but explosions originating in a morbid condition of the nervous system, their violence and frequency being proportionate to the degree of development of that condition. If this view be correct (and I am sure it is), the only rational treatment is that which aims to prevent the attacks by exerting a healing influence on the patient during the intervals. I hope to be able, at no distant time, to publish an account of my experience which justifies the above statements.—I am, sir, yours truly,

JOHN CHAPMAN.

A PLEA FOR OPIUM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I beg to state that M. Gaskoin's assertion in last week's impression of the MEDICAL PRESS AND CIRCULAR, that opium "seems wholly neglected" by the Irish practitioners in the treatment of epidemic cerebro-spinal disease, is not quite borne out by facts. I have seen opium employed in that affection in Dublin with the best results, and in my paper on eye affections occurring during the course of the malady, published in the last number of the *Dublin Quarterly Journal*, opium is mentioned incidentally in most favourable terms. In the same number of the journal Dr. Gordon in his exhaustive paper alludes at some length to the propriety of the administration of opium.

Chauffard is generally regarded as having been the first to employ and to recommend opium in this epidemic, but I venture to believe that others employed that drug before him, and recommended its administration, if not before, certainly contemporaneously with Chauffard, whose paper appears in the April number of the *Revue Médicale* for 1842. In the *Gazette Médicale de Paris* for April, 1842 (a weekly journal), Forget's papers on the Strasburg epidemic of 1840 appear, in which he speaks of the "excellent" and the "marvellous" effects of opium. I am under the impression that the epidemic appeared in Italy in 1839-40, and that opium was there employed and recommended by a physician named Elefanti. Forget states he derived the idea of employing opium from the writings of Sydenham.

Apologizing to you, sir, for occupying so much of your space, and to Mr. Gaskoin—himself a known authority on this subject—for venturing to question his assertion.—I remain, &c.

H. WILSON.

NAVAL MEDICAL ASPIRANTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your issue of the 12th ult., the letter from the Naval Medical Inspector General gives a most excellent idea of the description of candidates for gold lace and cocked hats, and ten shillings a-day. No firstrate young men offered! What a sad exposure for those colleges, "and by three naval surgeons." I know two of the three well, but rank is not talent—not yet awhile. What is meant by a *good* examination? however, let that pass, the *good* and the *moderately*—how expressive—*good*, and the *indifferent* were all taken. What a delightful batch of deputy inspecting examiners they will make. Well, they say "it is an ill wind that blows nobody good," I hope they are delighted with the friendly breeze that wafted them to such a heavenly shore.

I consider the promotion held out to these young men anything but a boon, it is simply an Admiralty dodge—what are their chances in getting a ship when promoted? What are the chances of their serving their time for increase of pay? What are their chances of *their ever being allowed to serve that time?* What are their chances of their having either a red or a black mark against their names, and yet never know that such a mark is there? What are their chances of having to retire for life with a broken down consitution, a wife, and eight or ten children, upon seven, ten, or eleven shillings a day—at the rate of tenpence or a shilling a-day for each of them. How well they will be educated, clothed, and fed, and how high they will move in society. No, sir, the Navy will get no respectable, firstrate men under the present regime. Let the Admiralty give those on the ten shilling list sixteen shillings a-day, and those on the eleven shilling list, a pound, and frame a retiring scale accordingly, and then, sir, something may be done. The shrewd, talented young man looks to his future position, not to be left in his old age, next door to beggary—a mere subsistence.

I have had to struggle for years upon six shillings a-day with a wife and eight children !!! Were I to die to-morrow I could not leave them a shilling, and my widow would have from the Royal Naval Supplemental Fund something, about twenty-six pounds a-year !!! Now, ye aspiring non-combatant young would-be heroes, look at this side of the question. If your captain should write against you to the admiralty, you will never know it, hence your future promotion is all "*in nubibus.*"—I am, sir, yours, &c.,

ONE OF THE VICTIMS.

MEDICAL OFFICERS' ANNUITY SOCIETY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I beg to trespass on your space by informing such of your readers as have not seen the last Poor-law Report that it appears from the 18th section of it, page 21, that though "every Irish Union has a claim to share in the benefit of this grant" of £59,300, the Commissioners have a discretionary power with respect to its distribution. Should this discretion admit of the appropriation of so small a sum as £1600, or even of twice that amount, to assist, I might say, to *ensure* the establishment of a Poor-law Medical Officers' Widows and Orphans Annuity Society, there is little doubt that Government and the

Commissioners would be well pleased to further such appropriation, if proposed by the Poor-law Medical Officers.

DENIS PHELAN.

Gleanings.

DR. WHISTLER'S CASE.—We regret to find a disposition springing up amongst boards of Poor-law guardians and committees of dispensary districts to deal in anything but a liberal spirit with the medical officers appointed under the Medical Charities Act. The miserably inadequate remuneration which is grudgingly doled out to these public officers has recently, as our readers are aware, been the subject of severe comment on the part of one of the highest Judges in the land. That comment was called forth by the revelations made in the course of a trial in which Dr. Whistler, the medical officer of the Bray dispensary district, was concerned. The onerous and responsible character of the duties incumbent on these gentlemen was then made abundantly manifest, and was the occasion of eliciting from the Bench an indignant protest against the system of inadequate remuneration which so widely, we might say universally, prevails. The board of guardians of the Rathdown Union, however, appear determined not to profit by the advice then tendered. They appear inclined rather to resent it as an unwarrantable interference with their privileges. An application from Dr. Whistler for six weeks' leave of absence was yesterday disposed of by them after a fashion which may claim, at least, the credit of originality. Dr. Whistler applied for leave of absence for the period named, on the ground of ill health, which was duly certified. It has been the custom to comply with similar applications, and to pay a substitute to attend to the duties in the meantime. The Bray Dispensary Committee had complied with this established custom. But the guardians seemed to think it one which would be more honoured in the breach than in the observance, and, accordingly, they declined to grant the required permission, but passed a resolution, allowing Dr. Whistler to absent himself from duty for two months, on condition of his paying the cost of providing a substitute. This wretched system of cheese-paring economy cannot be too strongly reprobated. It defeats its own object. The amount of pauperism in a community is dependent in no small degree on the provision made for proper medical relief to the poor. That object cannot be attained if the medical officers appointed to supply that relief are inadequately paid. The dispensary medical officers throughout the country are, as a rule, no doubt, thoroughly qualified men. But that is the very reason why they should be properly remunerated and considerately dealt with. The adoption of a contrary course will eventually drive properly qualified practitioners out of the service, and leave it to the less fit members of the body. The step taken by the Rathdown Guardians, and that adopted by the Naas Guardians, as reported in our columns to-day, are well fitted to insure this result. We had hoped that the payment of one half of the salaries of these officers out of the Imperial Treasury would have tended rather to increase the remuneration, and consequently to improve the character of the service. If the course pursued by the two bodies we have alluded to finds imitators elsewhere, our anticipations will be bitterly disappointed.—*Dublin Daily Express*, 18th July.

WE perceive by our correspondent's report of the proceedings at the meeting of the Rathdown Guardians that the Board have granted six weeks' leave of absence to Dr. Whistler, of Bray, on account of ill-health, aggravated, if not caused, by over-exertion during the existence of the cholera epidemic. The Board, however, have granted this leave on condition that he pays a substitute during his absence. It is hard that a dispensary physician, paid £90 yearly, could not, without pecuniary sacrifice, obtain sick leave. There is a strong feeling that in cases of illness the salary of a substitute should be paid out of the rates. An act of liberality is the best encouragement to future exertion. "LEAVE OF ABSENCE TO DR. WHISTLER—Mr. Smyth read a *recommendation from the Bray Dispensary Committee*, that Dr. Whistler receive six weeks' leave of absence in consequence of ill health, and that Dr. H. Raverty be his *locum tenens* during his absence, and *that he be paid for such services out of the poor-rates*. Mr. Smyth also read three certificates from Drs. Hudson, Stokes, M'Dowell, strongly worded, urging the advisability of change of air, rest, and freedom from all professional duties. Each and all of the certificates attributed Dr. Whistler's ill-health to over-work and straining of the nervous system from recent anxiety and professional labours. Indeed, Dr. Stokes went on to say that he was well acquainted with Dr. Whistler's constitution, having attended him for fever some years since, and he deemed it necessary to order him complete rest and change of air. A strong opposition was raised by Messrs. Riall and Brenan to the payment of Dr. Whistler's deputy out of the poor-rates. They had no objection to his taking two months' leave of absence, provided he paid his substitute himself, but it was not right to burden the poor-rates with a double salary for the one work. Mr. Smyth spoke warmly on the subject, and said this was an unparalleled case. He held in his hand the certificates of three eminent men in the medical profession, who would rather cut off their right hand than be guilty of falsehood. In those certificates, rest and quiet was distinctly laid down. Was it fair, was it right, that a man who, in a great measure, owed his present ill-health to his exertions as a dispensary doctor, should have to pay a gentleman for performing his duties while absent on sick leave? He begged to move that Dr. Whistler be given six weeks' leave of absence, and that his substitute be paid out of the poor-rates. The Chairman [Sir George Hodson, Bart.], agreed with Mr. Smyth. There was an application before him from the master, requesting leave of absence, but his case was quite different, he was going to see his friends, in fact, a fortnight's visit, and had made every provision himself that his duties should be carried on in his absence, but Dr. Whistler was in ill health and unable to carry on his business. In answer to Mr. Brennan, the Chairman replied that if Dr. Gray, who also received leave of absence for a fortnight, was under the impression that if he were on a sick bed and unable to attend to his professional duties he would be called on to pay his substitute during the period of such illness, he was greatly mistaken. Mr. Smyth then put his motion, which was negatived. After which, it was moved and seconded that Dr. Whistler be allowed six weeks' leave of absence from dispensary duty, and that the substitute be paid by Dr. Whistler."—*Irish Times*, 18*th July*.

A FACT.—"Tiens," said a Belgian Volunteer to his comrade on arriving opposite the War Office in Pall-Mall, "quel est ce batiment-la?" "C'est l'Hôpital des Incurables," said the other. "Et la statue?" was the next question. "Parbleu," was the reply, "c'est le médecin de l'endroit qui songe au pansement de ses malades;" and they both strutted on to look at the other beauties of our great metropolis.—*The Owl*.

THE HOSPITAL FOR SOLDIERS' WIVES AT ALDERSHOT.—The married soldiers of regiments now at Aldershot, and those also of other corps who have previously been quartered there, will regret to hear that Dr. Barry is about to leave the station where he has been so long employed on the medical staff. On the formation of the female hospital for soldiers' wives and children at Aldershot in September, 1860, this gentleman was appointed medical officer to the establishment, and secretary to the committee of management. In the discharge of these arduous duties Dr. Barry's services have been beyond praise; ever attentive and kind to the patients, their remembrance of him can but be one of gratitude, while his energetic efforts as secretary have been in the highest degree conducive to the success of the institution. Assistant-Surgeon Mackenzie, 62nd Regiment, has been appointed to succeed Surgeon-Major Barry.—*United Service Gazette*.

THE KALLIMA PARALEKTA.—These butterflies frequent dry forests and fly very swiftly. They were never seen to settle on a flower or a green leaf, but were many times suddenly lost sight of in a bush or tree of dead leaves. On such occasions they were generally searched for in vain, for while gazing intently at the very spot where one had disappeared, it would often suddenly dart out, and again vanish twenty or fifty yards further on. On one or two occasions the insect was detected reposing, and it could then be seen how completely it assimilates itself to the surrounding leaves. It sits on a nearly upright twig, the wings fitting closely back to back, concealing the antennæ and head, which are drawn up between their bases. The little tails of the hind wing touch the branch, and form a perfect stalk to the leaf, which is supported in its place by the claws of the middle pair of feet, which are slender and inconspicuous. The irregular outline of wings gives exactly the perspective effect of a shrivelled leaf.

We thus have size, colour, form, markings, and habits, all combining together to produce a disguise which may be said to be absolutely perfect; and the protection which it affords is sufficiently indicated by the abundance of the individuals that possess it.—*Westminster Review.*

THE REMEDY FOR CRAMMING.—The remedy for the pestilent system of cramming, which is eating into the very heart of our education, lies in the hands of one class of persons only. It is, perhaps, difficult to overestimate the amount of power for good and for evil that is placed at the disposal of these gentlemen who act as examiners for educational institutions and public bodies. They are intellectual monarchs with almost despotic powers, and with very few and slight restrictions. They can make and unmake lecturers and tutors, they can suspend, diminish, or increase the sale of this book or that, according to the character of the questions they put to candidates The chief inquiry of the student about to attend Professor A——'s lectures is, Will they equip me for the B examination? The first question of a university publisher, when he is offered a new text-book is, For what examination will it prepare the student? Were all examiners, with one accord, so to frame their examinations as to make them touchstones of real knowledge, the whole system of cramming would wither away in a twelvemonth.—*The Laboratory.*

Medical News.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.—List of the gentlemen who obtained the Licence in Medicine during the months of April, May, and June:—

W. H. Blenkinsop, Bournemouth, Hants; S. H. Harris, 27, Leinster-square; G. W. Hatchell, 13, Hume-street; J. H. Hatchell, ditto; J. D. Hillis, 21. Heytesbury-street; A. H. F. Lynch, Army Medical Staff, Killester Hall, Raheny; C. G. Lyster, Cascade House, Co. Kilkenny; J. P. McDermott, Riversdale, Dundrum; W. M. M'Dermott, Cloongee, Foxford: B. F. McDowell, 29, York-street; G. W. Owens, 25, Kildare-street; B. Roberts, Eastbourne, Sussex; W. F. Samuels, Seafield House, Kingstown; G. Shaw, 93, Talbot-street; F. H. Smith, Bombay Army.

The following gentlemen obtained the Midwifery Diploma during the same period:—

D. H. Bastable, Kanturk; S. H. Harris, G. W. Hatchell, J. D. Hillis, A. H. F. Lynch, C. G. Lyster, J. P. McDermott, H W. Maunsell, 21, Rathmines-road; A. O'Flynn, Sligo; W. F. Samuels.

EXTRAORDINARY FATALITY TO THREE SURGEONS.—A letter from Kehl, in the *Courrier du Bas-Rhin*, mentions the death, a few days back, at Heidelberg, of a surgeon named Weber, and two of his assistants, under very painful circumstances. All three had been to a country-house in the neighbourhood to attend two children attacked by diphtheria. In the case of one of them, the operation of tracheotomy was found necessary, and M. Weber, whilst engaged in performing it, unfortunately allowed a small clot of blood to fall into the child's windpipe. In the absence of a proper instrument for extraction, he sucked the wound to get out the foreign substance. Having failed, the others in succession applied their mouths to the wound, and at last succeeded in their object. They, however, all caught the malady, and succumbed to it in the course of six hours. Professor Weber was only 39 years of age, but had already acquired a high reputation.

CHOLERA IN SICILY.—The official accounts of the cholera in Sicily, dated Palermo, the 29th of June and the 4th of July, report as follows:—In the province of Girgenti, from the 18th to the 27th of June, 2573 attacks, and 1371 deaths; Caltanisetta, from the 17th to the 27th, 1305 attacks, and 762 deaths; Trapani, from the 19th to the 27th, 17 attacks, and 13 deaths; Catania, from the 23d to the 28th, 107 attacks, and 55 deaths. For the week ended July 4, for the provinces of Catania, Caltanisetta, Girgetti, and Trapani the attacks were 2383, and the deaths 1421. Palermo and Messina enjoy perfect health, and both have established cordons against infected districts.

THE new Infirmary at Leeds seems to be a structure of almost unexampled completeness. It is built of stone and red brick, and contains ten galleries; these are at least 28 feet wide, and have a length of from 110 to 125 feet. The central hall is 150 feet long and 65 feet wide. The building was designed by Mr. Gilbert Scott, R.A.

INTERESTING SOUVENER.—At the final disposition of the property of the late Mr. John Phillip, R.A., the very last work on which he was engaged, "The Race against Time," has appropriately been presented to Mr. Henry Thompson, Surgeon to University College Hospital, under the following circumstances. During an illness, says a popular writer in a morning contemporary, which shortly preceded his last attack, Mr. Thompson attended him, and was sitting with one hand on the artist's pulse while the other held his watch, which he was attentively regarding. Something in the *pose* and general effect struck the artist, who said, "If I live through this, I'll paint the subject and call it 'The Race against Time.'" He only lived to execute the preliminary sketch in chalk, which has deservedly been presented to Mr. Thompson.

THE Committee of the Liberal-Conservative party of the University of London, at a meeting held on Wednesday evening, drew up a circular to be issued as a report to the 300 members of the large committee.

THE annual meeting of the Governors of the Westminster Ophthalmic Hospital, was held on Wednesday. During the last year 8220 new cases were treated, and 1005 operations performed. The hospital is undergoing enlargement and repair. There is a deficit in the exchequer of £160, 9s. 7d.

CHOLERA AT ADEN.—A Suez telegram states that all arrivals from Aden are submitted to a strict quarantine, on account of the cholera. It is strange, however, that arrivals from India are not so dealt with.

RELATION OF THE ANT-EATER TO THE APE.—The researches which M. G. Pouchet has just laid before the French Academy show that the joints of the fore limb of the great ant-eater resemble closely those of the primates.

THE cause of tubercular disease, according to a memoir just published by M. Lebert, of Breslau, is simply a shortening of the pulmonary artery.

THE ATTEMPTED MURDER OF DR. PRICHARD.—John Jones, 70, who was tried at the Glamorgan assizes on Wednesday, and found guilty of shooting at Dr. Prichard, with intent to murder him, was brought up on Thursday for judgment. The sentence passed by Mr. Baron Channell was ten years' penal servitude.

THE NAVAL REVIEW.—A fatal accident occurred in one of the forts on the Gosport peninsula during the attack made on the forts by the gunboat Flotilla on Wednesday. Two gunners of the Royal Artillery were blown away from the mouth of an eight-inch gun by a premature explosion of the powder charge they were engaged at the time in ramming home in loading the gun. One poor fellow had his left arm carried off near the shoulder, and the other had his left hand and part of the arm, nearly to the elbow, carried away The former died in hospital on Friday morning. The latter may recover, but he is maimed for life.

NOTICES TO CORRESPONDENTS.

Communications to the London Editor should be addressed to 20, King William-street, Strand; to the Edinburgh Editor, at Maclachlan and Stewart's, South Bridge; and to the Dublin Editor, at 3, Lincoln-place.

All Contributions are attentively considered, and unaccepted MSS. are returned on receipt of stamps for postage; but the Editors cannot be responsible for any accidental loss, nor can MSS. or replies be delivered on personal application.

Contributions should be *legibly* written, and only on one side of the paper.

When proofs are forwarded it is of the utmost importance that they should be corrected and returned without delay.

Firmus.—Consult any respectable practitioner.

A Subscriber wants to know the end of Mr. PORTER'S case of aneurism of subclavian artery.

ANSWER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—My patient with subclavian aneurism is still in the hospital. The wound perfectly healed. The tumour *harder*, but pulsating. Radial pulse scarcely to be felt, but has returned by collateral circulation. I removed the needle fifty-three hours after the operation—not a drop of blood followed. GEO. H. PORTER.

P.S.—If in Dublin, I shall be happy to let the "Subscriber" see my patient.

MEDICAL APPOINTMENTS.

Addenbrooke, E. H., M.R.C.S.E., has been appointed Resident Surgical Officer to the General Hospital, Birmingham, vice F. Steel, M.D., resigned.

Attwood, Mr. F L., has been appointed Senior House-Surgeon to the Royal Free Hospital, Gray's-inn-road, vice Mr. J. D. Hill, appointed one of the Surgeons to the Hospital.

Cameron, R., L.F.P.&S.Glas., has been appointed one of the Resident Medical Officers to the York Dispensary, vice E. S. Green, L.R.C.P.Ed., resigned.

Cape, J. T., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Halwell District of the Totnes Union, Devon, vice J. R. Quick, L.F.P.&S.Glas., resigned.

Carse, Dr. E., has been appointed Medical Officer and Public Vaccinator for the No. 7 or Middlezoy District of the Bridgewater Union, Somersetshire, vice Farmer, whose appointment has expired.

Coombs, C. P., M.B., has been appointed Medical Officer for the Castle Cary District of the Wincanton Union, Somersetshire, vice S. S. Larcombe, M.R.C.S.E., resigned.

Hilton, C. S., M.D., has been appointed Medical Officer for the Upholland District of the Wigan Union, Lancashire, vice Morris, deceased.

Holt, J., L.R.C.P.Ed., has been appointed Medical Officer for the Ovenden District of the Halifax Union, Yorkshire.

Hornby, G., M.R.C.S.E., has been appointed Surgeon to the York County Hospital.

Istance, R., M.R.C.S.E., has been elected Surgeon to the Garth Sheet-iron Company's Works, near Newport, Monmouthshire.

Mitchell, J., M.D., has been appointed Medical Officer for the Barnard Castle District and the Workhouse of the Teesdale Union, Durham, vice I. C. Cust, M.R.C.S.E., deceased.

Leatham, W., L.R.C.S.I., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Coal Island Dispensary District of the Dungannon Union, vice S. J. Graydon, M.D., resigned.

Penn, Mr. A., has been appointed Medical Officer for District No. 1, and the Workhouse of the South Stoneham Union, vice J. C. Harris, M.R.C.S.E., resigned.

Plowman, R., L.R.C.P.L., has been appointed House-Surgeon to the Coventry and Warwickshire Hospital.

Tindall, Mr. A. M'J., has been appointed Medical Officer for District No. 2 of the Market Harborough Union, Leicestershire, vice Thos. Heygate, M.R.C.S.E., resigned.

Conolly, J., M.D., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Moycullen Dispensary District of the Galway Union, vice Ireland, resigned.

Darby, M., L.K.Q.C.P.I., has been appointed Medical Officer for the Monasterevan Dispensary District of the Athy Union, Co. Kildare, vice Thos. Carroll, M.R.C.S.E., deceased.

Edmundson, J., M.D., of the Clonmel Auxiliary Lunatic Asylum, has been appointed Resident Medical Superintendent of the District Lunatic Asylum, Castlebar, County Mayo, vice T. C. Burton, M.D., resigned.

Stephens, W., M.D., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Dunkineely Dispensary District of the Donegal Union, vice Davis, resigned.

Births, Marriages, and Deaths.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

Douglas.—On the 15th inst., at Somerford-place, Sunderland, the wife of Mordey Douglas, M.R.C.S.E., of a daughter.

Haslett.—On the 19th inst., at Rockville Cottage, Laghy, the wife of Samuel T. Haslett, M.D., of a son.

Horne.—On the 9th inst., at Buckhurst-hill, Essex, the wife of E. Horne, M.R.C.S.E., of a son.

Leatham.—On the 8th inst., at Stratford-green, Essex, the wife of J. Leatham, M.D., of a daughter.

Ramsbotham.—On the 10th inst., at Park-place, Leeds, the wife of S. H. Ramsbotham, M.D., of a son.

Young.—On the 9th inst., at Berkeley-terrace, Glasgow, the wife of Dr. J. Young, of a daughter.

MARRIAGES.

Murray—Trimen.—On the 11th inst., at St. Pancras Church. Wm. Berkeley Murray, M.D., of Tenbury, to Elizabeth Helen, daughter of Richard Trimen, Esq.

Lamb—Edgar.—On the 16th inst., at St. Mary's Church, Birkenhead, Joseph Lamb, M.R.C.S., to Mary Emily, only surviving child of Samuel Edgar, L.F.P. & S. Glasgow, both of Birkenhead.

Gray—Atkinson.—On the 10th inst., in Lisnadill Church, Robert Gray, Esq., of Armagh, L.R.C.S.I., to Harriet Anne, eldest surviving daughter of Hampton Atkinson, Esq., Lisnadill.

DEATHS.

Rutherford.—On the 14th of May, at Wellington, India, C. C. Rutherford, L.R.C.S.Ed., of the 18th Hussars, aged 35.

Huie.—On the 10th inst., R. Huie, M.D., of Edinburgh.

Andrews.—On the 12th inst., at Wellesley House, Brighton, J. Andrews, F.R.C.P.L., aged 65.

Savory.—On the 15th inst., at Wendover, Bucks, suddenly, Joseph Thomas Savory, M.R.C.S., L.S.A., aged 67.

Monks.—On the 15th inst., Edward Monks, M.R.C.S.E., of Norfolk-terrace, Darnley-road, Hackney, late of Arbour-terrace, Commercial-road East.

NOTICE TO ADVERTISERS.

The Medical Press and Circular

OFFERS UNUSUAL ADVANTAGES

FOR the Insertion of announcements from its extensive and largely increasing circulation in each of the three divisions of the United Kingdom and the Colonies. Being also supplied to the Hospital Libraries, &c., it will be found a most valuable medium for Advertisements of Books, Vacancies and Appointments, Sales, and Transfers of Practices, Surgical Instruments, Chemicals, and Trades generally.

The scale of charges is as follows:—

Seven lines and under	£0	3s.	6d.
Per line afterwards	0	0s.	6d.
One-quarter page	1	0s.	0d.
Half ,,	1	15s.	0d.
One ,,	3	0s.	0d.

The average of words per line is twelve.

When advertisements are given for a series of insertions, a very considerable reduction from the above scale is made.

☞ Advertisements for Insertion in this Journal must be at the Office, on Monday, by Three o'Clock.

Army Medical Department, July 13, 1867.

AN EXAMINATION of CANDIDATES for COMMISSIONS in the MEDICAL DEPARTMENT of her Majesty's Army will commence on MONDAY, the 12th of August, 1867.

Candidates having the necessary qualifications to practise Medicine and Surgery under the Medical Act, and who are unmarried, and not under 21, nor above 28 years of age, are eligible to attend.

Applications for the necessary printed form should be made in writing to the Director-General of the Army Medical Department, War Office, London.

There will probably be about 55 Vacancies.

(Signed) T. G. LOGAN, Director-General.

LONDON NURSES' INSTITUTE,
42, South Audley-street, Grosvenor-square, W.

TRAINED NURSES (Medical, Surgical, Mental, and Monthly), can at all times be obtained from this Institute.

Hospital Appointments by special arrangement.

Letters and Telegrams should convey the nature of the case to be attended.

Apply to the Manager or Matron. T. HAMILTON, Manager.

NAAS UNION.

MEDICAL OFFICER FOR THE WORKHOUSE WANTED.

IN consequence of the much-lamented death of Dr. Kellett, late Medical Officer to the above Establishment, the Board of Guardians will, on Wednesday the 31st inst., proceed to appoint a Medical Officer, duly qualified, in accordance with the order of the Poor-Law Commissioners, at a Salary of Eighty Pounds per annum (the Board providing him with an Apothecary.)

The Gentleman appointed will be required to reside in Naas, or its immediate vicinity.

Applications from Candidates (who are required to be in attendance on the day of election at Twelve o'clock noon), accompanied by testimonials, and directed to "The Presiding Chairman of the Board," will be received by me up to Eleven o'clock on the above day.

By Order of the Board,

E. MOLLOY, Clerk of Union.

Naas Workhouse, Clerk's Office,
17th July, 1867.

At a Meeting of the Board of Guardians held on Wednesday, the 10th July, 1867, on the motion of George P. L. Mansfield, Esq., J.P., seconded by Mr. Patrick Farrell, it was unanimously resolved:—

That the following be inserted on the Minutes of the Board—

The Board of Guardians of the Naas Union have heard, with deep regret, the announcement of the death of their Medical Officer, the late Dr. Kellett

The Board feel it their melancholy duty to express their entire satisfaction for the manner in which the late Dr. Kellett performed his arduous duties during the many years he was attached to this Establishment, and they most sincerely condole with his afflicted relations.

(Signed)

GEORGE WOLFE, Presiding Chairman.
E. MOLLOY, Clerk of Union.

Apothecaries' Hall of Ireland, 40 Mary-street. The following new Medicines and Preparations are manufactured in the Laboratory on the premises, and a supply constantly on hand:—

THE NEW PREPARATIONS OF THE PHARMACOPŒIA, 1867.

TICHBORNE'S VESICATING COLLODION.

Dr. Richardson's Styptic Colloid; Syrup of Phosphate of Iron, Quina, and Strychnia; Chlorate of Quina; Perchloric Acid; Carbolic Acid, pure and crude (the latter free from Sulphuretted Hydrogen).

Original Communications.

SURGICAL COMMENTARIES:

INTENDED AS A DIGEST OF THE AUTHOR'S PRINCIPLES AND PRACTICE, AS ILLUSTRATED BY THE MORE IMPORTANT SUBJECTS OF SURGERY.

By GEORGE MACILWAIN, F.R.C.S., Etc.

AUTHOR OF "MEDICINE AND SURGERY, ONE INDUCTIVE SCIENCE;" "THE UNITY OF THE BODY;" "DISEASES OF THE MUCOUS CANALS OF THE BODY;" "STRANGULATED HERNIA;" "LIFE OF ABERNETHY," AND OTHER WORKS.

NO. IV.—OF THE PHENOMENA USUALLY INCLUDED IN THE TERM "SYMPATHY" BY HUNTER AND OTHERS.

It has been remarked by Professor Whewell, and many other people, that the most important discoveries have resulted from the philosophical study of familiar and obvious phenomena, and, we have, in the History of Science, numerous and interesting records of this truth, and "In Medicine and Surgery, one Inductive Science," I cited several examples. The phenomena of "sympathy" present, I think, a series of facts which appear to me by no means as yet to have been sufficiently appreciated. I cannot go into the subject *in extenso*, without repeating much that I have elsewhere published. Wherefore I will endeavour first to summarise some of the principal points in a series of propositions which, as they are, apart from all theory, demonstrable facts, I shall venture to term "axioms."

With regard to the term "sympathy," it is not perhaps entirely unopen to objection, but I think it better than any other which our present knowledge enables us to supply. We might borrow the term "Induction," as employed in Electrical Science, but, to say nothing of the confusion arising from the employment of that word in the Baconian sense, it seems to imply more of opinion than the term "sympathy." Strictly speaking, we cannot use "sympathy" in a good sense; yet, in the sense here employed, it by no means implies suffering. All that is intended is, that certain causes, forces, influences, or by whatever name you choose to designate them, applied from without, or engendered *in* the body, and acting on one organ or one structure, are often productive, or followed by phenomena in some other organ or structure, on which they cannot be perceived to have acted, except through some connection or correspondence between the organ on which they primarily acted, and that on which the secondary effects were produced.

Axiom 1. Any force or influence acting on any one organ or structure may be followed by sensation or action on any other, and this reciprocally.

2. This reciprocity is not always equal; one organ will excite another much more readily than it will be excited itself by that organ.

3. Under ordinary circumstances, sympathetic phenomena (as we propose to call them) take place more readily between some organs than others.

4. As the rule, sympathetic phenomena occur most readily between organs, having community of structure, or of function, or contiguous or continuous surfaces.

5. Notwithstanding that the foregoing is true generally, these phenomena sometimes occur very readily between organs not having, in any known sense, this community or function, such as between the stomach and testicle, testicle and salivary glands.

6. It is not at all necessary that sympathetic phenomena should in every case be preceded or accompanied by *perceptible* phenomena in the organ or structure primarily affected, as in many cases of stomach and brain.

7. There is no known* faculty of the mind which may not be affected by some force which may have acted primarily on some organ of the body.

8. Although any organ of the body may communicate disturbing or other influence to any function of the brain or any faculty of the mind, yet experience justifies the conclusion that the mind is more readily disturbed by some organs than others. That is to say, that certain faculties of the mind are more readily disturbed by this or that organ than others, and this reciprocally.

9. That these preferences (so to speak) which occur between the bodily organs and the mental faculties are observable between the mental faculties themselves—that, for example, the intellect is materially influenced as to its activity, its direction, and, in its results, by the dominant passion or moral sentiment.

The foregoing axioms appear to me to be indisputable. The practical application of them, combined with attention to that law of determination to surface, or by whatever other name it may be designated, will, I think, be found to form the best basis for a more definite practical science. This application does not appear either in the writings of J. Hunter or Abernethy, but, as we proceed, I think it will be seen that it is the legitimate out-growth from the careful and extended study of the thoughts of these great men.

Mr. Abernethy observed that disorder might exist in an organ without that organ exemplifying any symptoms of it. This was a step. But what Abernethy thus spoke of as an exception, is unquestionably much more like *a rule*—for, with the exception of such injuries as are inflicted by mechanical or chemical means directly on an organ, it will be found that what we call the symptoms, and what is really the seat of the cause, are seldom found in the same organ.

I have used the term conservative to the law of determination to surface, and I believe that the phenomena of sympathy have the same tendency. I am disposed to retain that term at present because, although it has something of assumption in it, still it is sufficiently demonstrable and has a more comprehensive application than continuous, antiguous, or any other term. For example, *as the rule* the disturbing influences which may be ranged under one or other of these other terms, are, so far as I see, from a more important to a less important site. This conservative *tendency* is seldom imperceptible, whatever may be the organs affected. Even in the somewhat obscure sympathy remarked on by John Hunter, between the stomach and testicle, not being equally reciprocal, there is an evident conservative tendency. If the testicle had been as readily disturbed by the stomach, as the stomach is by injury to the testicle—either the habits of mankind must have been materially improved, or the usual ratio of increase in population must have been indefinitely diminished. An incalculable number of people would have had diseases of their reproducing organs; so numerous and constant are the diseases of the stomach in the present mode of living. Again, when the generative organs in the female become the seat of disease, it is, as I long ago observed, very generally at about the time when they can be better spared than any other organ in the œconomy—when, in fact, the time has elapsed, or is about to elapse, at which their special functions ceases. It is true that we *do* have, in both sexes, diseases of the generative system (as exceptions in early life), but a type of conservation is by no means always imperceptible as regards the species. (I am not thinking of those diseases the result of direct injury, whether chemical or mechanical), but in the male early diseases of the testicle seldom occur in organizations otherwise favourable to the reproduction of healthy offspring; whilst, in the female, if young, the order is usually the ovary before the uterus, and one ovary rather than both. This, as regards the uterus is favourable to the individual life, as the retention of one ovary to the power of reproduction.

But the phenomena of sympathy strongly suggest that in very many cases, affections of the reproductive organs, are *secondary* phenomena, and the improvements in practice deducible already, as I believe, from the study of sympathetic phenomena, will greatly improve the treatment of some of those lamentable cases, for which we seem to have

* I use the term "faculty" as including all or any "powers" in a common term—whether called passions, moral sentiments, or intellectual faculties.

at present no remedy but removal by operation. I am far from subscribing to this necessity, but I have no space here for enlarging on the subject. With regard to the transference of disturbing influences from the organs to which they are first presented to other parts of the œconomy, the daily occurrences in the practice of medicine offers familiar illustrations. We administer medicine, say to the stomach, and we recognize the effects sometimes on one, at other times on other organs, without the stomach having given us any evidence by which we could have imagined that it had been affected. Our purges, diuretics, sudorifics, &c., are so many illustrations of this—the two former, perhaps, being more constant than are sudorifics. This tendency to transfer influences to other organs is unquestionable. In all cases it is not quite certain that the influence is transferred from an organ more essential to life to one that is less so. It holds, I think, as regards organic diseases, but not where the secondary organ is one of the outlets of the body. In this case the disturbance of the œconomy appears to be more quickly got rid of by secretion, which we shall have occasion to regard as the universal relief, in some form or other, from all forces tending to injure the body. When we have to consider the action of poisons, an opportunity will present itself of discussing the subject of secretion more fully.

The want of more accurate study of the sympathies, appears to me to be seen every day in practice, in the almost constant manner in which symptoms are treated instead of the causes on which they depend. No doubt there is some improvement in this, but I know no part of surgery scarcely which is wholly free from this defect, as we may probably see in the course of these papers.

Now, it may be asked, how happens it, that if, as you say, we are so constantly treating symptoms, that we ever have any success. In the first place, in many cases, the removal of symptoms is no more *necessarily* good practice than the abuse of bleeding was good practice, because it made a man feel better. But, without refining unnecessary, the phenomena of sympathy show that it is very possible to affect a primarily affected organ through a secondary, but the question is, as to the consequences of those two kinds of practice, even when a removal of symptoms is achieved.

The symptoms of diseases are, as alleged, not the site of the causes of them, but transferred actions, and are in themselves, if let alone, sometimes curative ; and, again, as these phenomena which we called sympathetic, are susceptible of being excited in any direction, influences, whether medical (commonly so termed), dietetic, or any other not included in that term when directed to an organ secondarily affected, do act (sometimes directly, sometimes indirectly) on that which was primary. I am desirous of avoiding theory as much as possible, and therefore am only interested in drawing closer attention to undoubted facts, being comparatively careless whether the reader may adopt my explanation of them, or otherwise. The more familiar the illustration the better.

Certain matters taken into the stomach frequently affect the head, and this in various ways, yet there is no pain or other sensation necessarily in the stomach. Still, the patient may be, and often is, relieved in a moderate time by measures which are applied to the head, as rest, silence, subdued light, or it may be warm in one, or more rarely in another, cold applications.

Or he may prefer going into a warm bath, and a warm bed, and thus make the skin, which in the case supposed, has not exhibited any symptom—the channel for traquillizing influences.

In fact, there is no organ through which (in exceptional cases it may be) that you may not convey tanquillizing influences to an organ primarily affected. Whether that organ may be the seat of symptoms, or in many cases when it exhibits, as the primarily affected organ so commonly does, no symptom at all.

But the disadvantages of ministering to secondary organs *where you can discover* the primary are—in my view—very great, both in their more immediate as well as in their remote consequences. We shall have other opportunities of illustrating this. A very familiar instance of the advantages and disadvantages of ministering to primary or secondary sites, or causes, as the case may be, is shown in many cases of habitually torpid bowels. Now, in a great many cases, the fault is not, strictly speaking, in the bowels. These organs have a complex structure, and very extensive, very varied, and often very vivid sympathies, with mind and body. Hence the channels through which they become torpid are numerous, and (in different cases, of course), varied. Yet it too commonly happens that the remedies devoted to the correction of this state, consist almost entirely of excitants to the bowels themselves ; and with what result we have too many examples ; so that what I ventured to write some years ago, is scarcely beyond the truth, when I said that costive bowels are the torment of many a man's existence. But the disadvantages of ministering to secondary organs are, in my idea, much more serious than merely negative. They lead us to work organs, in many cases, that are doing too much already, and acting in compensation for organs which, up to a certain point, it is our object to excite into action. In fact, the ministering to secondarily affected organs, frequently leads to the excitation of organs, to which it is the very greatest importance to give all possible repose, and thus a treatment is adopted which is diametrically opposed to that which is most to be desired. Nor is it anything in disproof of this, that in some cases we obtain temporary relief. A healthy organ, acting in compensation for one not doing its duty, may *exceptionally* have its action so recovered, as to rally and have the primary organ, but I verily believe that the *factitious* continuance of a compensating action, is the too sure forerunner of organic disease. Even success, which is *temporary*—here, as it has in so many other cases—has given rise to a blind contentment, with established modes of proceeding, just as in regard to the enormous abuse of bleeding. Nothing, perhaps, impeded the more scientific adjustment of that practice, so much as the temporary improvement, which so often followed immediately on its application.

It must, however, be observed that, contrary as it may be to sound or scientific practice, to act on any but the primarily affected organ, when this can be discovered, there is an exception to this, when there is reason to believe that the primarily affected organ has become the seat of organic change. Here a remembrance of the sympathies of organs becomes often of the first importance to the obtaining of any relief of which the case may be susceptible.

In this case, according to the principles I submit, you should endeavour to excite secretion from some organ which, after a careful examination of the case, you have reason to believe is yet free from organic disease. Secondly —That which has ordinarily the closest community of function, or the most vivid sympathy with the primarily affected organ. These properties may or may not be found in the *same* organ. You thus, as regards community of function, carry out the ordinary law of the œconomy when diverted from its proper action by some interference which obliges the use of a compensating organ ; and what is so done from some interference which is removable by treatment directed to the primary organ, you now are obliged to endeavour to do from the interference of organic disease. This is a point in practice where discrimination is of the greatest value, for the very same practice which in ministering to a primarily affected organ, yet free from disease, is of the greatest benefit, becomes mischievous when applied to one diseased in structure. In speaking of organs, we must never lose sight that we are really speaking of them as subservient to their own nervous system, and again to that system as a whole, whether of mind or body.

This subject leads us to consider the various faculties of the mind and body as influenced by impressions previously addressed to the nervous system. Herein we soon find, I think, that to arrive at an accurate treatment, we must study the Sympathies much more deeply. I hope by and bye to find

space for a case or two, showing what may be done by observing what special faculties may be influenced by certain conditions of body. I think we have much here to learn as regards more refined adaptations to special conditions, than those indefinite prescriptions for repose, change of scene, &c. When I see insanity which appeared to me to be the result of forces acting on the brain, which a carefully traced history suggested as derived from the liver as the primary organ—when I say I see such insanity instantly disappearing on the occurrence of gout, I feel (after all, even as applicable to surgery, in a scientific sense), how coarsely we have studied relations of fact, cleared of all theory whatever.

This is all that I can say of sympathies at present. The foundations I am endeavouring briefly to sketch must next oblige me to request attention to one or two attempts at higher generalizations; and first, of a sketch of what I may call the analysis and identification of various phenomena assembled under the term "Fever."

CEREBRO-SPINAL FEVER: ITS TREATMENT BY MEANS OF ICE.

By JOHN CHAPMAN, M.D., M.R.C.P.,
PHYSICIAN TO THE FARRINGDON DISPENSARY.

(Continued from page 78.)

HAVING explained the several plans, the use of which I recommend in order to exert a sedative or "antiphlogistic" influence on the brain, and thus, so far as the brain is concerned, to "treat the symptoms" of cerebro-spinal fever by removing their proximate cause, I proceed to consider the propriety and method of applying cold, in order to subdue the symptoms of inflammation of the spinal cord and its membranes. I must here premise that the term "spinal cord," as just used, comprises the medulla oblongata which with the medulla spinalis constituted what Marshall Hall called "*the true spinal cord.*" Before we can act scientifically for the removal of the proximate cause of the group of symptoms, consisting of trismus, retraction of the head, opisthotonos, pleurothotonos, rigidity of the recti muscles, emprosthotonos, contraction of the muscles of the extremities, convulsions, and subsultus tendinum, we must first assure ourselves, of course, what the precise nature of that cause is. In classifying the symptoms of cerebro-spinal fever, I have assumed it to be hyperæmia, proceeding possibly to the extent of inflammation, of the spinal cord, but I am aware of the existence of a doctrine concerning the proximate cause of muscular contraction which is wholly inconsistent with that generally held on this subject, as well as with the practical application of it which I am now about to advocate. I refer, of course, to the peculiar views concerning the proximate cause of muscular contraction, and of pain, which have been elaborately and ingeniously expounded by Dr. Blande Radcliffe. In a paper entitled,—"The Treatment of Epilepsy: Principles and Practice," read to the Medical Society of London, and afterwards published in this Journal (March 27th, April 4th), I briefly explained Dr. Radcliffe's views, and adduced what appears to me conclusive reasons for believing them to be confuted by a large number of physiological, pathological, and therapeutical facts. On this occasion, therefore, while referring students interested in the subject to that paper, I shall assume, without further discussion, that all excessive muscular contraction is due to excessive energy in those nervous centres which preside over the muscular system. Now, this being so, it is obvious that the only rational way of treating locked-jaw, retraction of the head, and other tetanoid states, as well as convulsions and subsultus tendinum, is by lessening the energy of the nervous centres producing those phenomena. Can we do this? I affirm that we can, and, notwithstanding the difficulty of many thoughtful men in believing it possible, by applying ice along the spine, to influence the circulation of the spinal cord at all, and the fact that, up to the present time, this method has, with a few exceptions, been wholly disregarded or unknown, I believe that the time is not far distant when it will be counted on by medical practitioners as one of the most powerful remedial agents at their command for subduing hyperæmia or inflammation of the spinal cord.

Some physicians who are disposed to recognise the reality of the results which I have obtained by the application of heat and cold along the spine, and who cannot believe those results are due to the direct action of these agents on the spinal and sympathetic nervous centres, are inclined vaguely to regard them as phenomena of reflex action. (One of the most eminent physicians recently asked me if I had tried whether applying ice over the stomach would not produce the same effect as that produced by it when applied along the spine!) I am satisfied, however, that this view is untenable and quite inconsistent with many ascertained facts. But I cannot here enter on a discussion of this subject, and must content myself with observing that whatever mode of accounting for the results in question may be most scientific the existence of them is indubitable, and, as in a practical point of view, the question of their reality is the all-important one, I will, before proceeding further, adduce evidence that various morbid conditions of the muscular system analogus to those commonly associated with cerebro-spinal fever, may be most effectually abolished by the application of ice along the spine.

I have already cited the evidence of Dr. Todd, and I may observe in passing that he was one of the few physicians who never doubted that the application of ice along the spine acts directly on the spinal-cord. In the *Medical Times and Gazette*, March 12th, 1864, Dr. Edmunds reports a case of "Emprosthotonos (?) cured by the use of ice to the spine." The facts of the case are briefly summarised as follows:—An intelligent married woman, aged 28, mother of two children, and who was "altogether free from flightiness or hysteria," went to bed, January 21st, quite well, but on rising next morning at 7·30, found her fingers were slightly benumbed; they shortly afterwards "turned in." The "turning in" quickly extended to the hands, rapidly increased, and caused a cramp-like pain in the arms. Her legs became affected in a similar way but less severely. The morbid muscular contractions steadily increased during the day. At ten P.M. "her fore-arms were hard and rigid, and the wrists were so fully flexed that her hands were forced open," and "the backs of her wrists were fixed close to her mouth. . . . Her neck became turgid and the respiration somewhat constrained. . . Her spine was bent forward, and her knees were bent and drawn upwards. . . . She could not stand, and her legs were about as much cramped as in a bad case of cholera. . . There was an expression of great anxiety and pain upon the face, and the lips were sufficiently retracted to show the teeth. . . . She could swallow by making a great effort to ignore the tearing cramp-like pain which occupied her, and which forced from her a continual moaning scream." Between eleven and twelve A.M., Dr. Griffith ordered her some aperient medicine; at one P.M., Dr. Webber, who saw her in consultation, prescribed "sulphuric æther and antispasmodics at once, and a dose of morphia to be taken a few hours later if the pain should not abate." She grew worse; the morphia was given, and, afterwards, "all her symptoms were aggravated." At 10 P.M. Dr. Edmonds was called in. He ordered the administration of a purge consisting of croton-oil and calomel, an enema of turpentine and castor-oil, and the application of ice along the whole length of the spine. Cold was thus applied continuously during "seven hours, when all her severe symptoms had disappeared. The screaming and moans were at once mitigated by the ice, and in about half-an-hour ceased entirely. In two hours her feet became flexible. About 8 A.M. on the 23rd the spasms had so far subsided that she could open her hands, but the numbness remained. On the morning of the 24th the numbness entirely disappeared, and she had no return of cramps or spasms. . . . . The patient herself ascribes the relief of her dreadful pain and cramps entirely to the use of the ice," says Dr. Edmonds, who adds,—"and although it is

difficult to distinguish between the mere *post hoc* and the *propter hoc*, yet I cannot but believe, if ever I saw a life saved by a therapeutical application, that this patient's life was saved by the use of the ice in this way to the spine."

The Australian Medical Journal for March, 1866, contains a report of a case of tetanus treated successfully by the application of ice along the spine. In this case, chloroform and atrophine, three doses of each, were given; but no one reading the report will fail to be convinced that it was the ice along the spine which saved the patient. "In two hours after its application," says the report, "the spasms had considerably and decidedly diminished. . . Our entering the room caused such an excitement in the patient as to bring on all the symptoms that had been in abeyance for four hours and a-half. The application of the ice was renewed, and in twenty minutes the spasms had disappeared."

On the 24th of February, 1866, I received from Dr. Roberts, of Northallerton, Yorkshire, the following letter:—"As an old fellow-student, I have watched with more than ordinary interest your treatment of diseases by variations in temperature. Have you ever tried it in tetanus? I have a case of traumatic tetanus which has remained almost stationary for a fortnight, and I have a notion that one of your ice-bags applied to the spine would be of service. If you have any experience, I should be glad to avail myself of it, or if you have any theory on the subject, I should be glad to test it. I have given the patient belladonna and morphia, but to no purpose. The tetanus has supervened on a large scalp wound over the occiput, exposing a large-ish surface of the bone." I sent immediately to Dr. Roberts a spinal ice-bag of suitable length, also a "lumbar ice-bag," and recommended him to apply ice along the whole spine, and at the same time, by means of the lumbar-bag across the occiput—from ear to ear. I begged him not to let the presence of the wound deter him from placing the lumbar-bag as advised, and to keep both bags well supplied with ice, and applied continuously until the disease should be subdued. In reply to my inquiry as to the results of the treatment, Dr. Roberts wrote to me (May 20, 1866)—"I am glad to say my case of tetanus got quite well. I have not had time to put my notes of the case into shape and send them to the *Lancet*, but I hope to be able to do so very shortly." I regret to say this "hope" still remains unfulfilled.

In the *Medical Times and Gazette* of June 16, 1866, Dr. John W. Ogle reported a case of "tetanoid convulsions overcome for a time by application of ice to the spine." A boy two years old was brought to St. George's Hospital, at eleven A.M., February 16, in a state of general convulsions. Dr. Ogle "ordered an enema with castor-oil and turpentine to be given at once, and the gums to be examined for the purpose of seeing if they required lancing. It was found impossible, however, to open the mouth. He then ordered an ice-bag to be applied, and kept in close contact with the back, the entire length of the spine. . . Gradually the convulsions abated, and the child was considered by the apothecary well enough to be allowed to go home in the evening." On the following day, the child being "evidently not so well," was again brought to the hospital, but was placed under the care of Dr. Pitman, who prescribed grey powder, antimony and salines, and did *not* use ice: convulsions recurred, and proved fatal, February 19. Dr. Ogle, commenting on this case, observed:—"The substantial relief from the ice application was not a little interesting, and speculation upon the probability of a greater and more permanent benefit from a longer application of the ice could not be resisted."

Under the head of "Gleanings from Allopathic Literature," *The British Journal of Homœopathy*, for April, 1866, says:—"Falconer related the case of a boy, æt. 11, attacked with severe tetanus, who recovered under the constant application of ice to the spine for thirty-two days. Howard records a case of opisthotonos in a man, æt. 25, cured by ice to the spine." I have not ascertained what "Allopathic" journals these cases were gleaned from.

In The Medical Press and Circular of March 27th last, Mr. Hargrave reports a case of tetanus, in which great relief was given by ice applied to the spine, and in which a cure would probably have been effected, had a properly made spine-bag been used. The ice was applied in an ox-gullet, and during its application the patient was singularly benefited. Unfortunately, the gullet burst in the night, and ice was not afterwards applied, Mr. Hargrave being evidently ignorant that india-rubber spinal ice-bags, made under my direction, are readily procurable in Dublin. During the application of the ice, "the muscles of the lower jaw were so relaxed, that the patient could open her mouth and take some nourishment and medicine, from which," says Mr. Hargrave, "I augured favourably."

In the number of this journal for May the 8th of this year, I published a case of what I called "Tetanoid Paralysis of the Four Extremities," accompanied with swelling, ecchymoses on the feet, and extremely heightened sensibility, which was completely cured by the continuous use of spinal ice-bags.

On the the 12th ult., at the Farringdon Dispensary, I prescribed for a patient, Margaret Macgrath, aged 14, who was suffering from scarlet fever, with inflammation of the throat. The fever subsided, but on the 19th the patient came to me with the head violently twisted round, so that the face looked over the left shoulder: the cervical muscles were tense, extremely tender and sore, the tenderness extending to the shoulders, and were seemingly so swollen, that I thought, at first sight, the appearance was due to glandular enlargement. Being satisfied that the case was simply one of persistent spasm—a sequela of the influence of the fever on the spinal-cord, I ordered ice to be applied along the cervical and upper part of the dorsal spine. Within thirty minutes of the beginning of the application, which was continued two hours, the patient could move her head in any direction, and the next day all tenderness was gone.

The above statement of facts justifies, I think, my conviction that in the present state of medical knowledge our greatest chance of curing tetanus and tetanoid affections consists in the proper application of ice. I am aware that a number of cases were published in the *Lancet* a short time ago, which seemed to prove that ice to the spine is of no avail against this deadly malady. But the writer gives no particulars of his method of applying the ice, and, in the absence of these I can attach but little importance to his conclusions. It will be observed that in the case cited above, under the care of Dr. Roberts, I directed that while ice was applied along the spine, it should also be applied in a separate bag across the occiput, notwithstanding even that it had to be placed directly across a wound in which the bone was exposed. I consider the adoption of this plan in all cases of tetanus of the very utmost importance, and think it probable that in those fatal cases in which ice may have been applied continuously along the spine, it was not applied at all across the occiput. When ice is applied along the spine, and especially over what is called the cilio-spinal region, the vaso-motor nerve centres controlling the cerebral arteries are subject to its sedative influence, and, hence, those arteries become dilated, and are thus enabled to supply the encephalon with more blood than before. In this manner, as I conceive, the medulla oblongata is maintained in a hyperæmic state, at the same time that the spinal cord is subject to the sedative influence of cold. Such being the case, it is obvious that that influence may be partly neutralized by the preternatural energy of the medulla-oblongata propagated downwards; while, of course, the nerves arising from it, including the motor divisions of the fifth and seventh, and the muscles they supply, if not kept as active as they were before ice was applied at all, are, at any rate, scarcely likely to be rendered quiescent. Much, however, will depend upon the way in which the ice is applied. If, for example, it be restricted to the lower cervical and upper dorsal vertebræ (the cilio-spinal region), there will probably be a maximum afflux of blood to the head; but if the ice be continued upwards over each cervical vertebra to the base of the skull, the sedative

influence exerted on the spinal cord is likely to extend in some degree to the medulla-oblongata. The considerations here advanced afford an explanation, which is perhaps the true one, why in certain cases of tetanus ice applied along the spine has been found useless, and, at the same time, indicate that, as a general rule, when ice is applied along the spine in such cases it should be carefully kept in contact with the uppermost cervical vertebræ, and that it is always indispensably necessary to apply it in a separate bag across the occiput *simultaneously*.

The practical application of the foregoing facts and observations to the treatment of cerebro-spinal fever scarcely needs indicating: trismus and retraction of the cervical muscles when occurring in the course of that disease, should be treated in the manner just described, care being taken by incessant watchfulness that air (a bad conductor of heat) is not allowed to accumulate in the upper end of the spine-bag, or in the side next the head of the lumbar-bag placed across the occiput, and that both bags be kept well supplied with ice. If they are allowed to remain on the patient when they cease to be cold they will do positive harm ; for, as india-rubber, like air, is a bad conductor of heat, when it is applied to the skin, it prevents, of course, that passage of heat from it which would otherwise take place. This method of treating the tetanoid symptoms frequently associated with cerebro-spinal fever is fortunately calculated to subdue, at the same time, that morbid state of the cerebro-spinal axis which constitutes, so far as our positive knowledge extends, the very essence of the disease.

In those cases in which convulsions, partial or general, supervene the treatment should be the same ; for though convulsive paroxysms apart from cerebro-spinal fever may be effectually treated by ice alone the spine only, the action of the ice is always more complete and certain if, *when used during the fits*, it be applied across the occiput also ; and even though tetanus or tonic spasms of the cervical muscles may not occur in certain cases of the disease in question, there will probably exist strong reasons aginst so using ice along the spine as to facilitate the flow of blood to the brain in fuller streams than before without taking care to keep it under the sedative influence of cold at the same time. I need not enlarge here upon the efficacy of the spinal ice-bag in the treatment of convulsions, as I adduced ample evidence of its power in this respect in the paper on Epilepsy, already mentioned. I may, however, appeal to the testimony of Dr. Routh and Dr. Rogers, that in cases of both infantile and puerperal convulsions, they have found that the spinal ice-bag arrests them, and may add that I am in possession of a large number of facts proving, not only that these maladies, as well as epilepsy, are amenable to this method of using cold, but that laryngismus stridulus, ordinary night cramps, and the cramps of cholera, and those occurring in some cases of sea-sickness, may be completely subdued in the same way. I conclude, therefore, that all spasmodic, convulsive, or epileptoid affections incidental to cerebro-spinal fever may be most surely controlled by precisely the same treatment as is necessary, not only for the tetanoid group of symptoms, but for those to be now immediately referred to, and which I regard as no less significant of morbidly increased activity of the spinal cord.

In my pamphlet on Sea-sickness, and in a paper on the Sickness of Pregnancy—read to the Medical Society of London, I have developed my views concerning the pathology of nausea and vomiting, and in my work on Diarrhœa and Cholera, the pathology of those diseases, and the mode of production of an abundance of pale urine of low specific gravity, are also fully discussed, and, as experience emboldens me to believe, correctly explained. I shall, therefore, content myself here with the statement of my conviction that I have proved that nausea, vomiting, diarrhœa, and preternatural abundance of pale urine *can only occur* by virtue of a preternaturally vigorous action of the spino-ganglionic nervous centres presiding over the organs implicated, and that that excessive activity can be restrained most scientifically and most satisfactorily without the evil influence of narcotics, stimulants, or other drugs, by the use of the spinal ice-bag.

In the group of symptoms of inflammation of the spinal-cord and its membranes, I have classed, besides those just referred to, *erotic desires*, *priapism*, *subsultus tendinum*, *swelling of the tongue*, *petechiæ*, and *vibices*. It will probably be admitted at once, by each of my readers, that the first three of these disorders are expressions of disorder of the spinal-cord, and I shall, therefore, only observe respecting them, that I am assured by experience that they may be treated successfully by the spinal ice-bag, and that, if in cases when subsultus tendinum is present, the physician will apply the bag, and watch the results, he will generally be surprised and gratified, not only by the rapidity with which the affected muscles will be soothed into quiescence, but by the generally refreshing and vivifying influence which the ice thus applied exerts.

In the course of my report, mentioned above, of a "Case of Tetanoid Paralysis of the Four Extremities," I said,—"I regard the swelling and allied symptoms which took place in this child, as an example of preternatural nutrition due to excessive energy of the intensely excited spinal-cord ;" and "as, owing to the influence of the ice along the spine, the extreme spinal hyperæmia became gradually subdued, the general swelling of the little patient steadily subsided." *Mutatis mutandis*, these words apply precisely, in my opinion, to the swelling of the tongue often observable in cases of cerebro-spinal fever, as well as in many cases of epilepsy.

In the case of this child "there were also slight ecchymoses on the feet," these, as well as the petechiæ appearing in various fevers, in some cases of cholera, often in cases of epilepsy, and those, together with the larger spots (vibices) so abundant in cases of the disease in question as to give it one of its many names, I regard as results merely of the extremely intense action of those spinal nerves related to the elementary cells of the several parts of the organism, and presiding over their nutrition. I apprehend that the morbid action of those nerves in these cases is merely an excess of their normal action, and that by this excess they render the elementary cells attractive of blood from the capillary system in greater quantities than they can assimulate, and thus occasion its effusion in spots, the number and size of which are probably proportionate to the vehemence, *within a given time*, of the activity of the nervous force concentrated at the several points where it thus manifests itself. Whether, in addition to its action in this way, it also, by its preternatural power, effects a morbid chemical change in the blood immediately acted upon, is an exceedingly interesting question, which, however, I think science will probably answer hereafter in the negative. But in any case, assuming the reality of the cause here alleged, it follows inevitably that these sanguineous spots indicate no less decisively than do the symptoms already passed in review, the wisdom of applying ice along the spine.

(To be continued.)

A SHORT CHAPTER OF OBJECTIONS TO THE THEORY OF THE FŒTAL CIRCULATION,

USUALLY DESCRIBED IN LECTURES, ELEMENTARY TEXT-BOOKS, AND SYSTEMATIC WORKS ON ANATOMY, PHYSIOLOGY, AND MIDWIFERY.

By W. MACDONALD, M.D., F.R.C.P.E.,

PROFESSOR OF ZOOLOGY AND COMPARATIVE ANATOMY AT THE UNITED COLLEGE OF ST. ANDREWS.

EVER since the days of Galen, and perhaps earlier, the course of the blood in the human fœtus has been theoretically described as commencing in the placenta, and rising in the umbilical vein to the fœtus. On entering the abdomen, when closed by the meeting of the ventral lamaræ, it is said to give off two or more branches to the liver, and then to proceed to the heart, where it mingles

its supposed oxidized or arterial blood, with the reduced or venous blood, brought by the inferior vena cava from the lower extremities. The portal circulation from the liver by the three hepatic veins, enters the vena cava so obliquely, as to act as valves, preventing regurgitation. The current of this mixed blood is described as forcing its way through the foramen ovale in the auricular septum, and successively into the left auricle and ventricle, from which it is discharged by the arch of the aorta to the head and upper extremities, above the point where the ductus arteriosus is connected with the descending aorta. After the blood has circulated through the head and upper extremities, it is returned by the jugular and subclavian veins, forming the superior venæ cavæ, which pour their blood into the right auricle, in a stream which shoots through the mixed placental blood, without mixing with it, direct into the right ventricle, and by the left pulmonary artery through the ductus arteriosus into the descending aorta, at the point already noticed, carrying the venous blood to supply the viscera and lower trunk and extremities, and then by means of the iliac and hypogastric arteries, continued into the umbilical arteries, to circulate through the placenta for oxidation, thus completing a course of the blood, which is repeated during fœtal life till respiration begins. How so fanciful a theory should ever have been proposed, except in the dark ages of anatomical and physiological science, before structure and function were practically examined in the fœtus. The whole description seems only to have been derived from an acquaintance with the anatomy of the adult.

It is surprising how the great anatomists of the sixteenth and seventeenth centuries could have adopted so crude a theory, as many of them were well acquainted with the development of the bird's egg, especially Fabricius ab Aquapendente, who published a large work on the development of the *chick in ovo*, fully illustrated by wood engravings—coarse, indeed, when compared with those of the Dalzells, but equally truthful. When it is recollected that not less than ninety per cent. of all the animals living, or which have lived, are oviparous, and are fully developed, without any possible maternal connection, and that the ovo-viviparous marsupials, though developed and born within the parent, having no maternal connection, "are sent into this breathing world scarce half made up, and that so imperfectly and unfashionable" that they require to be transferred into the marsupial pouch, and there firmly fixed to the mammal teats.

Even the ovule of the human embryo for nearly a fourth of the period of pregnancy, is entirely detached from any portion of the maternal system for ten weeks after impregnation, but moves freely about in the uterus by means of its own innate power, having its oxidising and reducing circulation in full activity from the embryo to the chorion returned to the embryo. The ovule is as completely developed as in the *chick in ovo*, during the fourth and fifth days of circulation, while it is still in the Graafian vesicle. When it is at length kicked out by a *vis a tergo* from the ovisac or capsule furnished by the stroma or substance of the ovary into the outspread funbriated extremity of the oviduct or Fallopian tube, it consists of the various tunics or tissues so minutely described from the ovule of a rabbit, and figured on a magnified scale, by Dr. Martin Barry, in his valuable paper in the "Phill. Tran., 1839," part ii., p. 350, and quoted by Dr. Churchill, in his work on midwifery.

As soon as the ovule is discharged from the ovary, enclosed in its villous chorion, within which the embryo is surrounded by the germ membrane or amnion which Mr. Coste names "the germ epiderm" with its fluid, and floating in the *tunica medea* of (Bischoff) the albumino-gelatinous fluid contained within the chorion.

The human ovule exhibits the same elementary structure as in mammalia, birds and lower vertebralia, with such reduction in size and other modifications as require a special examination. From the very extraordinary minuteness of the most mature ova depending on the very small amount of Vitelline albumen around the yolk, "The ripest ovule in the ovary of the human subject and mammalia, generally does not measure more than from 1-15th to 1-20th of a line in diameter, rarely exceeding 1-10th, and with difficulty seen by the unassisted naked eye, which was the cause of its being so long overlooked or mistaken. It is only in comparatively recent times that its intimate structure and form have been studied with effect" (Wagner, p. 44). It is probable that De Gros, Prevott, and Dumas may have perceived it, but Von Bäer was the first who described it, and may be considered as the discoverer of the primary mammal ovule. He at first viewed the whole ovule as similar to the germ-vesicle of birds, mistaking the granular layer of the Graafion vesicle for the Vitelline or proligorous disc.

This was pointed out by Purkinje, who discovered the germ-vesicle, stating his belief that the ovule of Bäer was analogous to the yolk and its contents. After the discovery of the germ-vesicle in the mammal ovule, a great advance was made and announced almost simultaneously by Coste in his "Reserches sur le generation mammiferes," Paris, 1834; and Bernhardt and Valentin, "*Symbolæ ad ovi mammalium ante prægnationem*," Vralislaw, 1834. This last contains the first accurate account and faithful representation of the structure. Wagner claims "to have discovered the germ spot, and to have described and figured the whole ovule in its successive changes with greater care and sequence than had yet been done."—(Wagner, p. 44). T. Wharton Jones, in a paper read before the Royal Society in 1835, from his previous investigations in 1834 on the ova of man, in an Abstract on the Proceedings for the year, and in full in the *London Medical Gazette*, 1838.

The human ovule differs from the mammal, only in the bulk of the vitellus. There rarely occurs an opportunity of examining the human germ-vesicle in so recent a state as in the cat, dog, or rabbit, which are the best subjects for examination. As regards the early maturity of the human ovule in the ovary, prior to its reception by the oviduct or Fallopian tube, there is every reason to believe that it is so from those cases which have eluded the grasp of the funbriæ, and passed into the abdomen, and having attached itself to some part of the abdominal or visceral surface, becoming as fully developed as if it had passed normally down the Fallopian tube to the uterus, with its prepared decidual surface, which even in these cases is generally found fully expanded. There is an exceptional case mentioned by Dr. Lee. These cases also show that the chorion is not provided in the tube, as the chorion villi are the means of fixing the ovule to the maternal surface, like a parasite worm which derives its support without any connection with the maternal circulation, but entirely from its innate vitality. This abnormal human extra uterine ovule, having attached its villi and the accompanying capillary vessels, readily supply what was described by Hunter as the decidua reflexa, and probably something like a placenta may be at last formed on the visceral surface, as in the usual uterine gestation where the reflexa and scrotina are described.

Returning to the normal progress of the human ovule, the earliest described, and figured by Velpeau, and quoted by Churchill in his Midwifery, was an aborted ovule from an acoucheuse of not more than fourteen days after impregnation. He describes the whole ovule as not more than one-third of an inch in diameter, including the chorion villi, and in his enlarged figure both the chorion amnion and its enclosed embryo, attached by the blastine arteries, are clearly distinguishable. Churchill describes and figures this case. Wharton, Jones, and Allen Thompson have described earlier aborted ova. These must all have been discharged from the uterus. In the usual cases of pregnancy the embryo continues moving about in the expanding cavity of the uterus, till the end of the tenth week after impregnation, and it is not before the end of the twelfth week, when three months of pregnancy have passed, that the placenta is completed. It is surely incorrect to describe the circulation as commencing there and rising in

the umbilical vein, while it has been all the time for twelve weeks in full action in the vittello-embryonic circulation within the ovule. Allen Thompson describes the *atrium cordis*, or primitive auricular heart, as discharging its first contents of "pale orange or yellowish fluid," (probably the liquor sanguinis or plasma) the punctum saliens indicating the contraction of the heart, by which this fluid is discharged through the only efferent vessel, the ductus venosus, to circulate among the venous blood discs on the upper vascular network to the terminal sinus, from which there is a fringe of minute capillary vessels connected with it, by means of which the plasmas is brought within the influence of the villa and at once oxidised, the capillaries forming the terminal branches of the vein, and the rootlets of the vascular area external to the visceral or mucous lamina, gradually forming larger and larger tubes, till at length, in the case of the bird, the right and left blastine arteries from each half of the vascular network are continued by the hypogastric and iliac arteries into the corresponding aortæ upward to the arterial aortic bulb. In the human embryo, however, the iliac arteries, after supplying the lower extremities, unite over the lower part of what becomes the lumbar vertebræ, and forms the single abdominal aortœ from which, in its ascent, it gives off the following important arteries :—

1. The inferior mesenteric artery is distributed to the mesocolon and large intestines, when these are developed, and then from the lower part of the centro-chord, the future spinal axis, to the Wolffian bodies, onward to the Allantois, as a membranous diverticulum sanguinis largely expanded external to the fœtus amid the albumino-gelatinous fluid named, by Bischoff, tunica media, in the space between the amnion and chorion, while the abdomen is open with a wide sinus, which becomes narrowed into a mere cord, returning in the umbilical cord, continued down behind the bladder as the urachus, and mistaken as a part of the urinary system. The outer surface is well supplied with arteries and veins, by which the diverticular function is performed, while in the tunica media, often extending near the chorion, but without any connection with it, or assisting the oxidizing the venous blood, sometimes incorrectly attributed to it, its recurrent blood is returned by the *inferior* mesenteric vein as one of the tributaries to the portal sinus in the longitudinal fissure of the liver.

2. The superior mesenteric artery supplies the mesentery and small intestines when developed within the viscero-mucous lamina of the germ-disc, forming the very vascular membrane of the umbilical vesicle enveloping the non-vascular structureless membrane of the yolk connected with a loop of the intestine, into which it is finally drawn ; before that occurs the yellow globules forming the inner layer of the umbilical vesicle, as pointed out by Robin, within the vascular umbilical vesicle spreading out by a wide sinus, while the abdomen is open, becoming largely expanded in the tunica media, as the second diverticulum sanguinis, its recurrent venous blood returns within the abdomen at length, by a narrow neck inclosed in the umbilical cord; the blood having been poured into the superior mesenteric vein forming with the inferior mesenteric vein, another tributary to the portal sinus.

3. The cæliac axis distributing the gastric and splenic arteries, becomes the permanent diverticulum sanguinis discharging its venous blood by the splenic vein behind the pancreas, into the great mesenteric vein to form the portal sinus in the longitudinal fissure of the liver, and which, in the transverse fissure, divides into right and left portal veins to circulate in the different lobes in company with branches of the hepatic artery, one of the divisions of the cæliac axis. The recurrent venous blood from the liver returns by three hepatic veins into the upper and anterior part of the inferior vena cava below the diaphragm, so obliquely as to act as valves preventing regurgitation.

As soon as the aorta reaches the diaphragm, it enters between the crura, giving off the phrenic arteries, and then dividing into a right and left main trunk as in birds, one on each side of the centro-chord or spinal axis, as high as the fovea cardiaca (wolff) or pharyngeal den. At a point before the cervical column, each of these main trunks subdivides into two branches, which proceed forward on each side behind the heart, to enter the arterial aortic bulb. These have been mistaken for the branchial arteries, being equal in number and in a similar locality, but were shown by Reichert to have no connection with brancheæ, but as if to show the tenacity of early prejudice, even in great men, he still declares them as the homologues of the branchial arches.

These aortic branches, passing behind the heart, meet from each side, and communicate with the arterial bulb, from which the right and left subclavian and carotid arteries ascend to supply the upper trunk and extremities, the head being supplied by the external and internal carotids. The recurrent venous blood from these regions by means of the jugular and subclavian veins form the superior venæ cavæ, in conjunction with the veins from the azygeal sinuses of the spinal column. The whole venous blood of the upper body and extremities, is collected in the right auricle, where it meets the blood in the inferior vena cava, brought from the lower part of the trunk and extremities, having also received the portal circulation. From this point below the diaphragm, the whole venous blood of the embryo is sent by the ductus venosus to the terminal sinus, and after being oxidized under the influence of the chorion villi, is distributed on the lower rete vascular layer, to form the blastine arteries, which complete the embryonic circulation, during the first three months of pregnancy, after which time the ovule being grounded, as it were, on the decidual surface of the uterus, the chorion villi with the capillary area being concentrated on a circumscribed part of the uterine surface, become shortly included in the spongy mass of the uterine portion of the placenta, consisting of cells and sinuses which subsequently are described as lined by the inner membrane of the maternal curling ateries, which is continuous with the lining of the maternal veins, by which the blood is restored to the maternal system, never communicating with either the uterine decidual circulation or the fœtal circulation, whose branching chorion villous tufts are merely bathed in the placenta-sinuses, lined by the inner membranes of the maternal circulation. In point of fact, it would seem that vascular system, both of arteries and veins, is really a continuous closed tube, only allowing the changes of oxidation and reduction in the capillary area, by means similar to endosmose or exosmose.

Having shown, on the authority and diagram of Wagner, Muller, Carpenter, Van Bäer, Martin Barry, Allen Thompson, and others, that the circulation in the embryo commences in the venous side of the heart or auricle, which has only a single efferent tube—the duchis venosus, which ultimately becomes the umbilical vein of the fœtus, and that there are two inferent veins from the azygeal sinuses, filling the single cavity of the atrium, or auricle, after its first yellow plasma is discharged for the first vitello-embryonic circulation, but which are immediately, on the second embryonic circulation, received by the left branch of the vena cava superior, and thus the venous blood from the region of sinuses of the spinal axis is collected into the general mass of the venous blood in the heart, whether it consists of a single auricle, as at first, or after the ventricle is formed on the opposite side of the base of the heart, which then becomes the auriculo-ventricular septum, with ventricular orifices; or still later, near the full period of pregnancy, when the ventricle has been divided by a septum into right and left ventricles, and the auricular septum has been formed, leaving the foramen ovale to allow the passing and repassing of the venous blood to or from the ventricle into the auricle, that it may escape by still the only outlet—the ductus venosus, to the umbilical vein, which carries the blood by the full muscular action of the heart to the chorion branching villous tufts, in which, in fact, the oxidation of the blood continues till respiration expands the lung-cells.

Prior to this, there is no communication between the arteries and the cavities of the heart in any condition, whether a single or quadruple cavity, the systole of the auricle forcing the blood into the ventricle, which immediately contracts with its whole force, tilting up the apex, and giving the pulse-beat, when felt in the cord, in cases of prolapsus, or during turning, of from 60° to 70° per minute, while stethoscopically examined through the maternal abdomen it often ranges as high as from 120 to 150. May not the above explain how the difference occurs, the whole strength of the pulse-beat depending on the tilting of the apex of the heart, as in the adult? and only felt in the umbilical vein, in which the whole blood is sent from the heart prior to respiration.

Adopting the data afforded by Wagner, Muller, Carpenter, Van Bäer, Martin Barry, Allen Thompson, and others, as stated and figured in the various elementary and systematic text-books familiar to medical students, I sum up in the four following objections that the usual descriptions of the fœtal circulation as erroneous.

I. Anatomically:—

1st. By tracing the course of the umbilical vein from the placenta, which is not completed prior to the end of the third month of pregnancy, when one-third of the period has passed, and the vitello-embryonic circulation having been in full activity within the chorion of the ovule during that period.

2nd. By describing the giving off of two or more branches from the umbilical vein direct to the liver, when there is no direct communication with the vein, and the portal blood of the liver being entirely supplied by the mesenteric veins.

3rd. By describing the structures in the heart which are not developed till considerable progress has been made.

4th. By describing the aorta and pulmonary arteries as communicating with the ventricles prior to respiration, which is not the case, as the whole arterial system is unconnected with the cavities of the heart, but only with the arterial aortic bulb, which Wagner describes as pinched off from the base of the heart.

5th. By mistaking a small remnant of the aortic primary branches in the embryonic condition for the ductus arteriosus as conducting the venous blood from the right ventricle to the descending aorta.

II. Physiologically it is still more erroneous:—

1st. By assuming that the oxidised or arterial blood flows from the placenta after it is completed by the end of the third month (12 weeks) by the umbilical vein, which, after entering the abdomen, sends this blood by two or more branches to liver, which is both anatomically wrong, as already shown above, and also physiologically. The liver is an organ which prepares the blood for oxidation, whether by the placenta—the branchiæ of fishes, or the lungs of the breathing animals—except a branch of the hepatic artery for the growth of the organ, the liver is entirely supplied by the portal circulation derived from the mesenteric and splenic veins which, accompanied by branches of the hepatic artery, is at length poured into the upper part of the inferior vena cava by three hepatic veins, entering so obliquely as to act as valves, preventing regurgitation when the whole force of the heart propels the whole venous blood down the umbilical vein to the chorion, and subsequently to the placenta, when completed.

2nd. By describing the mingling of the pure blood with the reduced venous blood brought by the inferior vena cava (and, of course, the portal blood from the liver), and then stating that this mixed blood is forced through the *foramen ovale*, before a septum is formed into the left ventricle—the whole course assumed after this is impossible, as the ventricle has no connection with the aorta.

3rd. By describing the arterial and venous blood as mingling in the heart, while it will not be denied that the only communication between veins and arteries for *oxidation* is in the capillary area, and the only communication between arteries and veins for *reduction* is also in the capillary area, where all material changes in the constitution of the blood, if not entirely at least principally, are completed. It may fairly be asked—What is the use of oxidizing the blood, if it is to be rendered impure before it is applied for the development of the embryo? Such a scheme or theory, never supported by evidence or fact, ignores all physiological laws, and would at once bring the circulation to stagnation and a dead lock.

4th. The described and adopted course of the blood in the aorta is too complex, requiring, in the language of these railway days, too many switches to be attended to in directing blood up the arch of the aorta from the left ventricle, and from the right ventricle, down the same tube, the descending aorta distributing the impure venous blood to the trunk, the lower extremities, and viscera, before returning to the placenta.

III. Physically it is inconsistent with the laws of hydraulics to suppose that the fluid could rise in a tube higher than the surface, unless by the force of gravity or mechanical compression. Were a physicdist to place a glass tube in a glass vessel containing a red fluid, without any mechanical aid, and to expect that it would not only rise in the tube, but stem a current down the same tube, propelled by a powerful contracting force. Such a statement would at once be declared nonsense, and impossible. Yet this is what the prejudices in favour of the three hundred year old theory maintains—that the placenta, without any muscular or mechanical force, sends its blood by the umbilical vein, contrary to the current sent by the whole force of the heart from the auricle, by the ductus venosus, as the first part of the umbilical vein, with the whole venous blood, to the placenta to be oxidized.

IV. The received theory of the fœtal circulation is inconsistent with the course of the blood when examined during the development of the embryo in the ovule, as above described from the works of embryologists and microscopists, and during the more advanced progress of the fœtus after the placenta is completed, prior to the inflation of the lung-cells by the first inspiration, when the whole course of the blood is instantly changed, and the old apparatus immediately dispensed with.

The researches of Van Bäer have shown that both venous and arterial blood-discs, as well as blood-vessels, pre-existed the heart, as formed by the torsion of a vein, and the circulation first set in motion by the pulsation of the heart, indicated by the punctum saliens forcing the yellow plasma or liquor sanguinis over the venous layer of the rete vasculosum to the chorion, from whence the circulation is continued among the red blood-discs on the arterial layer of the vascular area to the embryo, to be circulated upwards to the arterial aortic bulb, distributing its nutrient oxidised blood in its ascent from the lower body and extremities and the viscera, till it reaches the arterial aortic bulb, from which the upper trunk-extremities and head are supplied by the subclavian and carotid arteries. The recurrent venous blood from all regions of the body being collected in the heart, is again propelled by the whole action of auricles and ventricles through the duches venosus, still its only outlet into the umbilical vein, *en route* to the placenta, for oxidation, thus completing a round of the fœtal circulation; and as the first circulation had been anticipated by the pre-existence of the blood-discs and vessels, so the circulation required after respiration begins, the whole apparatus has been prepared for an instant change of the arterial connections by the breaking up of the arterial aortic bulb, the pulmonary arteries from the upper part to the right and left, and the aorta from the lower part, rising between them, and bending over the left pulmonary, to form the arch of the aorta now distributing the whole oxidised blood throughout the body without much change till it passes through the capillaries, where alone the reduction of the blood occurs.

I humbly feel convinced that the theory now proposed is more rational than the old theory of three centuries, and still obstinately persisted in; and that it affords the true key to the whole fœtal circulation by the entire separation of the arteries from the

cavities of the heart. All respiration commences and connects the cavities of the heart, whether consisting of one or four divisions, entirely and solely with the venous system, by the ductus venosus and umbilical vein. This cannot be viewed as a discovery at all to be compared with the great Harveian discovery, but in the correction of a long prevalent error, it has the merit of at least capping and culminating it, on the principles of the immortal Harvey, who had overlooked it as completing his own. I feel convinced that till it is adopted there is little chance of any correct view of the fœtal circulation being entertained.

Having been challenged by more than one eminent physiologist to adduce evidence experimentally in disproof of this old theory, which never was established on practical experiment or demonstration, nor during the three centuries of its predominance, I hold that it is with the supporters of that theory that the *onus probandi* and *experimentaliter demonstrandi* first lies, and I throw down the gauntlet to any one of the eminent anatomists, physiologists, or embryologists in the numerous medical schools of the vast metropolis or elsewhere, to adduce a single fact resting either on direct observation or experiment, showing the course of the blood from the placenta by the umbilical vein to the heart of the fœtus; or that the venous blood returns by the aorta and umbilical arteries in the cord to the placenta for oxidation. Till this is done, I feel no necessity to adduce any other than theoretical inference on the general physical and organic laws against the old theory of the fœtal circulation, now shown to have been based on false anatomy, and quite inconsistent with the known physiological laws regulating the course of the blood from veins to arteries and from arteries to veins can only occur in the capillaries, and that it is also inconsistent with the physical laws of hydraulics. At the same time, I will endeavour to bring the subject before the next meeting of the British Association at Dundee, and urge the appointment of a small committee to investigate this very important subject, and report; and if I do not succeed in getting an allocation of money towards the expense of the examination, I will subscribe my share along with the members of the committee.

PURPURIC DISEASE AFFECTING SEVERAL PERSONS AND A PIG AT KINGSTON, NEAR HEREFORD.

By Dr. LINGEN, of Hereford.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I beg leave to send you notes of a remarkable case of purpuric disease affecting the human subject and the pig in the same locality, kindly furnished to me by Dr. Lingen, of Hereford. The attention which this form of malady has attracted as an epidemic and epizootic in this country recently makes all connected with it of special interest. It points to a wider area of morbific influence when we find the disease exemplified nearly simultaneously in localities far asunder, and, for this reason, it would be well if gentlemen in the provinces, here and in England, would kindly favour us with brief notices of such cases as may present themselves in their localities.—Faithfully yours,

8, Merrion-square, West, July 27, 1867. R. D. LYONS.

Rough notes taken 11th July, 1867.

The pig, eight months old, had been in the possession of Mrs. Seal five weeks; was bought and reared in the village (Kingston).

Taken ill about 18th of May, and was killed, because considered to be dying, on the 30th. Was first observed to be "stiff," then drowsy, and so continued most of its time, never exhibiting *any* excitement. On the second day distinct purple spots appeared in abundance on the belly and inside the thighs, then on the back, and a little on the sides; lastly on the nose and face; the animal had a peculiar odour; lived about nine days, taking very little food (never sick); was generally warm, though it often shivered during the first few days, less towards the end. It was killed when too weak to get up or stand; it was remarked that its blood did not coagulate. Two other pigs cotted with it to nearly its death, did not take the disease.

C. Powell, deceased, carried it to its grave, and buried it. The pig was not opened.

Servant girl, Mary Davis, æt. 16; first ill about 18th of May. She often went to the pig, but did nothing for him; was taken with slight chill, very drowsy, and severe headache; skin very hot, not red; no spots; much sweating for several days; was weak, but not so weak as to keep her all day in bed; for the nine or ten days she remained at Mrs. Seal's, when she went, in an open gig, to her own home, a distance of six miles. Remained at home ill a month, and then returned—scarce up to her work, and at this time, two months from the attack, looks feeble and anæmiated.

Mrs. Seal, the landlady, who often visited the sick pig, whose cot was *close* to her back door, was taken ill about the 31st May, two days before Mary Davis left with dry retching, often very faint; pain in both temples, neither constant nor very severe; generally drowsy day and night; tongue said to have been dry and not furred; she had great thirst; skin always hot, whether perspiring or not; "felt very hot inside;" eventually much sweating by day, and especially at night; bowels always regular.

Had a very large purple spot on the loins, one not so large, on the outer part of the thigh, others smaller, in various places. Nails and finger ends often purple, but not cold.

The most marked symptom was great pain in right upper arm to the elbow, scarcely implicating the joint itself; this was severe at first, and kept on nearly a month, being red most of the time.

The cowman, late Chas. Powell, æt. 46, who was not in strong health, but in his ordinary condition. It was he who carried the pig a hundred yards to his grave, and buried him. He was taken ill the next day (30th May), with drowsiness, severe headache, and very great pain in right upper arm, which was red, altogether similar to that of Mrs. Seal. Pain in the arm continued severe till the day before he died, on which day, Saturday, Powell walked in to Hereford, six miles, to see Mr. Lane, his usual medical man, and walked (with difficulty) much of the way back. While in Hereford, he drank beer and brandy, and was much confused at his visit to Mr. Lane; was restless all that night, complaining of pain in the bowels (no purging), and next morning (2nd June), at 6 A.M., went to the house of a Mrs. Powell, near Mrs. Seal's, where he sometimes lodged, saying he was going to die, and there sank at 9·30. Arm then red and swollen, but free from pain.

An inquest held next day on the body, before Mr. Lanwarne, but nothing especial transpired that I have not recorded.

The old woman, Mrs. Powell, in whose house C. Powell died—taken ill same day—was sick, and had vertigo, and felt "curious;" ailing and weak for a fortnight, but not so as to lay by; had thirst and loss of appetite; no purging.

Mrs. Seal's son herded the pig constantly, but was not ill at any time; he was, however, much in the fields, and away from home by day.

The pig's cot and yard were encumbered with manure, and the drains in a bad state.

It is to be observed, I saw one only of these cases—Mrs. Seal's—and her not until she had been ill a fortnight. It is now a month since Mrs. Seal first came to me; she is still weak and thin, and needs constantly porter, wine, and quinine.

Exclusive of the old woman, in whose house the only fatal case died, and the pig, there were three patients apparently affected more or less seriously by the disease. The man, C. Powell, who visited the pig daily and buried him; the young servant, Mary Davis, who had an illness of six weeks (neither had purple spots) and recovered; and the landlady, whose illness is scarce over yet. C. Powell was attacked on the Thursday evening with diarrhœa and

severe pain in the arm, and died at 9.30 A.M., Sunday. The girl, Davis, had no spots at all, and was generally pale rather than red, though her skin felt *hot*. C. Powell had no well-attested spots, but the lower two-thirds of his arm were red from the first. Mrs. Seal had many distinct purple spots, and her arm seems to have been similarly affected to that of C. Powell.

The sweating was very marked and long-continued in Mrs. Seal's case—less so in the girl's, and still less in C. Powell's.

In all, headache, though present, was only moderate; and in all, thirst was marked, and prostration was moderate. In C. Powell's case only was diarrhœa present, and in that, only for the first day. No hæmorrhagic symptoms in any of the cases, and only in Mrs. Seal's case do we hear of lividity of the finger ends. Contagion is not strongly indicated, inasmuch as the associates in the cot of the pig did not take the disease, and Mrs. Seal's son, who attended much on the pig, was not infected. The young girl, though she took the disease early, did not give it to her relatives at home. Again, though Mrs. Seal had others residing in her house, and kept a much-frequented public, no one else in or out of it seems to have taken the infection. True, the old woman in whose house C. Powell died became ill, and remained ill a fortnight, yet her symptoms were not very strongly marked.

A STATISTICAL REPORT OF 570 CONSECUTIVE CASES OF MIDWIFERY ATTENDED IN PRIVATE PRACTICE.

By JOHN DICKIE, M.D., L.R.C.S.E.

DURING the last five years—namely, from 1862 to 1866, I have registered 570 cases of midwifery, and have kept brief memoranda of the principal incidental occurrences. I propose, in what follows, briefly to analyze the series, which I present, in first place, in the form of a table:—

Date of attendance ...	1862.	1863.	1864.	1865.	1866.	Totals.
Number of cases ...	109	118	124	96	123	570
Sex of child ...	M. F.	M. F.	M. F.	M. F.	M. F.	M. F.
	60 49	62 56	66 58	48 48	62 61	298 272
Presentation of head ...	104	112	122	92	119	549
,, breech ..	2	3	1	2	1	9
,, feet ...	0	1	0	1	0	2
,, arm ...	1	0	1	0	1	3
,, face ...	1	1	0	0	0	2
,, placenta ...	1	0	0	1	1	3
,, funis ...	0	1	0	1	0	2
Delivery by forceps ...	11	12	10	14	8	55
,, craniotomy ...	0	0	1	0	0	1
,, turning ...	2	0	1	1	2	6
Cases of twins	1	0	0	3	0	4
,, ,, still-births ...	3	4	4	3	1	15
Mortality to mothers ...	0	1	0	0	0	1

Of these 570 labours, 110 were primiparous and 460 non-primiparous. The total number of childern born was 574 (there being four cases of twins); of these, 300 were males and 274 females. Only one mother died from the accidents of the puerperal state; still-births amounted to 15; the forceps were employed 55 times, and mal-presentations numbered 21. I shall briefly offer a few remarks explanatory of the above figures.

Forceps.

One striking feature in my practice appears to be the large number of forceps cases—55 in 570, or 1 in 10, certainly a very unusual percentage—and from this circumstance, one might suppose, I have not been sufficiently impressed with the maxim that "a meddlesome midwifery is a bad midwifery." My conviction is that this standing rule is calculated to do much mischief; for, on referring to my notes, I find that in no single instance was the use of the forceps followed by bad consequences either to mother or child. This fact speaks for itself. I have discontinued the use of ergot, for I found that invariably the forceps had to be resorted to, after all, to complete the delivery. In all cases where the labour is lingering, and the maternal parts sufficiently prepared for their use, I employ the forceps with every confidence, especially in primiparous cases, and am firmly convinced their timely use has enabled me to shorten the sufferings of the mother, and in some instances save the life of the child, two very important points in obstetric practice. My impression is, that were midwifery practitioners more in the habit of using the forceps, fewer accidents would follow what appear to be quite natural cases.

Still-Births.

The table also brings out the important fact that still-births are below the average—15 in 570, or about three per cent.; of these eight were putrid at birth, one destroyed by craniotomy (it was an extraordinary large child in a first pregnancy), three deaths are explained by placenta previa, one by funis compression, one hydrocephalic, and one was an anencephalous monster, the head of which appeared to be a large fleshy protuberance from the upper part of a well made body, there was no neck, and the extremities terminated in round fleshy knobs, instead of hands and feet; it was born in the seventh month.

Placenta Previa.

The cases of placenta previa were three in number—two partial, which I managed by simply rupturing the membranes, and leaving the cases to nature; one complete, which I treated by tearing through the placenta, turning, and bringing down the feet; the children were dead, but the three mothers made good recoveries.

Mortality to Mothers.

Very favourable—1 in 570. The case was a natural delivery in a second confinement. Acute peritonitis set in on the fifth day, and proved rapidly fatal. I attributed the attack to an indiscretion on the part of the patient.

Flooding and Retained Placenta.

The absence in the table of post partum hæmorrhage and retained placenta complications is worthy of notice. Not once has there occurred a case either of decided retention of the placenta, or severe flooding. Possibly my method of managing the third stage may have contributed to this result. In every case, immediately after the expulsion of the child, I grasp the womb firmly with my left hand, while, at the same time, I stretch the funis with my right, and keep it on the stretch until separation takes place. As a rule, the after-birth is expelled shortly after the child.

Rupture of Funis.

I had one case of rupture of the funis, which might be recorded. The string encircled the neck three times, and while I was endeavouring to get a loop over the head, a strong pain sent the child into the world with a jerk. The cord was completely torn out at the umbilicus, and some difficulty was experienced in arresting the hæmorrhage, but a well-fitting compress, and plenty of the powdered matico, proved quite successful.

Hospital Reports.

SPECIAL REPORT ON THE TREATMENT OF UNUNITED FRACTURES.

No. I.*

CASES are continually occurring, in which several modes of treatment have proved incapable of securing bony union after fracture, and many questions will naturally arise in the minds of surgeons as to the best mode of proceeding. These cases are often the cause of great disappointment and anxiety, and although not of every day occurrence, yet they are so full of interest that we propose, in a few brief articles, to give a clinical review of the whole subject. There can be little doubt that a considerable proportion of these cases originate in the part having been too frequently subjected to motion, so that a false joint is formed, or, at the least, mere bands of fibrous tissue, in which no ossific deposit has

* Gentlemen who may be willing to furnish reports of cases of ununited fracture to be included in this special report, will oblige by forwarding them immediately to the Editor of the Hospital Report Department, 20, King William-street, Strand, London, W.C.

taken place, form the only union. In these cases the ends of the bones are not unfrequently covered with a synovial-like membrane, and a capsule may even be formed around the injured part.

But, besides this local cause, non-union may originate in a depraved constitutional state. Mere debility is said to be capable of giving rise to it, while syphilis, phthisis, gout, cancer, and other constitutional diseases are frequently mentioned as obvious causes. Pregnancy and lactation have each also been blamed for this occurrence. So febrile diseases, while they last, are said to be unfavourable to union, as also is paralysis of the limb in which the fracture has taken place. A state in which there is deficiency of calcareous matter in the system would naturally enough be likely to hinder bony union. Age seems to have but slight influence. If we fairly weigh all the constitutional causes that may determine non-union, we shall easily be led to admit that they alone do not suffice to account for the results of practice. We are, therefore, driven back to notice the local peculiarities. How important these may be, is palpable enough in the history of numerous cases. Thus, instances have been recorded in which a small portion of the soft tissues being interposed between the fractured extremities of the bone, has sufficed to prevent union. Another cause of non-union, strictly local, and in one sense accidental, is the vascular supply of the fractured ends. The anatomical position of the injury may not only determine non-union, but also necrosis. Each fragment must throw out callus to repair the damage. But it may happen that the fracture has taken place in such a position, that the vascular supply of one end is more or less impeded or cut off, and this insufficiency of blood must result in insufficient or imperfect callus being formed. Rupture of the nutrient artery at the seat of fracture is probably a frequent cause of the non-union in the shafts of the long bones. Insufficiency of arterial supply may also be debited with the fact that intra-capsular fractures almost always unite by fibrous tissue only. What bony union does take place, is derived from the callus poured out by the shaft. To the same fact also is due the frequent occurrence of necrosis of the detached head.

The treatment has been as varied as the obstinacy of the cases has suggested. It is perhaps natural, that in all cases mere apposition of the parts, all motion being prevented, should first have a full and fair trial. Splints or starched bandages for such purposes are commonly applied. The only risk attending them is, that the anxiety of the Surgeon to secure perfect approximation, and even pressure of the broken ends against each other, may lead him to bind so tightly as to interfere with the circulation of the limb. This, where any cachexia exists, is commonly combined with constitutional treatment, which, judiciously prescribed, is likely to be beneficial. A tonic course, good diet, and cod-liver oil, have undoubtedly promoted union in phthisical patients. If deficiency of calcareous matter be believed to exist, an attempt may be made to supply it by diet or medicines. For this purpose lime-water has been a favourite remedy. The various phosphates will suggest themselves as most appropriate. The mere supply of habitual stimuli that have been interrupted has been successful. More active medication has been resorted to, in defence of which cases have been related in which salivation was followed by bony union.

Of operative procedures, the first to mention is the subcutaneous section of the ligamentous bands. Some go so far as to leave probes between the ends of the bones for several days. By this method a simple is, as it were, converted into a compound fracture. More grave still is the passage of a seton through a false joint, as this may give rise to fatal hæmorrhage, erysipelas, or some other dangerous complication.

Complete excision of a false joint is an operation of a most dangerous kind, and only justifiable after all other means have failed—or, where there is hope, that it may be a lesser evil than amputation.

Dieffenbach's ingenious method of driving ivory pegs into the fractured extremities of the bones has been extensively practised with varying results. It is only suitable, for the most part, in fractures of the femur and humerus. It is, of course, an operation not to be lightly undertaken, but, from its results, perhaps the most available of any which we have named. It is, at any rate, in the hands of an average surgeon, free from the danger of wounding an important artery, which is more than can be said for the seton, or for subcutaneous section.

A few years ago the above might have been said to have comprised all the modes of treatment in common use. But in 1859, M. Ollier published *(Gazette Medicale)* a series of experiments on the production of bone from the periosteum. The following year, Sedillot and Jordan seem both to have availed themselves of these investigations, and to have commenced a plan of operating, the success of which entirely depended on the power of the periosteum to produce bone. About the same time, and evidently without communication, Bigelow proceeded in a similar manner in the United States, and he has continued to operate on this principle with remarkable success. In our next number we propose to enter fully into the method of treatment adopted by Bigelow, and of which the following table exhibits the results :—

Case.	Bone.	Causes of Injury.	Duration.	Wire Remained.	Result	Remarks.
1	Humerus.	Arm caught in a splitting machine.	3 yrs.	4 mos.	Well.	*Seton; blisters; rubbing ends of bone together; excision of ends of fragments.
2	Radius.	Arm caught in machinery.	4 yrs.	2 yrs.	Well.	
3	Humerus.	Arm caught in a hand-car crank.	8 mos.	6 mos.	Well.	*Rubbing ends of bone together.
4	Humerus.	Arm caught by a revolving shaft.	1 yr.	2 mos.	Well.	
5	Femur.	Crushed by a heavy team.	20 mos.	5½ mos.	Well.	*Blisters; seton; drilling ends of fragments twice.
6	Humerus.	Gun-shot wound.	11 mos.	5 mos.	Well.	
7	Humerus.	Compound fracture.	18 mos.	4½ mos.	Amputation.	Softening of the bone.
8	Humerus.	Arm struck by a falling elevator.	5 mos.	4 mos.	Well.	*Drilling ends of fragments.
9	Humerus.	Crushed by wheel of hand-car.	1 yr.	4¼ mos.	Well.	
10	Humerus.	Gun-shot wounds.	5 yrs.		Well.	*Excision of ends of fragments; excision of ends and wiring fragments; two operations by Dr. Bigelow.
11	Humerus.	,, ,,	2½ yrs.	4 mos.	Well.	*Excision of ends of fragments.

*Previous operations which had failed.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.

SURGICAL RECORDS,

By WILLIAM STOKES, Jun.,

SURGEON TO THE HOSPITAL; LECTURER ON SURGERY, CARMICHAEL SCHOOL.

STRUMOUS DISEASE OF THE ELBOW-JOINT OF NINE MONTHS' STANDING: SUB-PERIOSTEAL RESECTION OF THE ELBOW-JOINT BY THE VERTICAL INCISION OF PARK: AFTER TREATMENT BY THE GYPSUM BANDAGE AND THE CONTINUAL BATH: CASE PROGRESSING FAVOURABLY.

THERE can be little doubt that of the articulations for disease of which resections are now so frequently practised, the elbow-joint must be held to be the one which is

specially suited for this operation, inasmuch as unfavourable results are of such rarity, and also from the fact that the operating surgeon is now in a position to expect, with good reason, not only the subsequent attainment of perfect flexion and extension in the joint, but also a re-formation more or less complete of the removed osseous structures which, in the great majority of cases, undoubtedly can be attained, either by careful preservation of the periosteal fibrous envelope, or, when it is possible, by the method of *évidement*, which has been recommended in preference by the eminent Strasbourg Surgeon, M. Sédillot. A glance at the table of 333 cases of excision of the elbow-joint which have been collected from various sources, and published in the "Archives of Clinical Surgery," vol. vi., 86, by Dr. Dontrelepont, will at once satisfy the most sceptical surgeon in regard to the great rarity of unfavourable results in these cases. They are as follows :—

In 333 cases—

Death	40, or 12 per cent.	
Amputation	14, „ 4·2	„
Anchylosis	23, „ 6·9	„
Mobility	256, „ 76·87	„

In truth, the operation very seldom indeed terminates fatally, and when it does so, it is from pyæmia or other causes, which are common to all operative procedures. The only instances which have fallen under my observation, and which terminated fatally, were two. One in which there was acute inflammatory disease in the joint at the time of the operation, and the other was one in which the operation was performed—I may add, not in this country, to our credit be it said—for no disease, but for a congenital malformation of the elbow, which impeded, to a certain extent, the natural motions of the joint. In this latter case the patient died of pyæmia on the eighth day after the operation.

The particulars also of the case of C. Waddick, whose left elbow joint I excised, and the account of which I published in the *Dublin Quarterly Journal* for May, 1865, fully bear out the truth of the statement made above in regard to, not only the possibility but probability of obtaining subsequently perfect mobility in the new joint. The patient now enjoys every motion in the elbow that the healthy joint possesses, perfect power of flexion, extension, pronation, and supination. The osseous reformation also is very remarkable. Encouraged by the success attained in this case, and which I have seen in many cases equally well attained by other surgeons, I determined to give the patient, whose case I am about briefly to record, the chance of obtaining, by similar means, the possession of a useful arm, and, as far as the case has gone, though in many respects an unfavourable one, owing to the large amount of disease which was found external to the joint, it promises to fulfil these not too sanguine expectations.

Catherine Ryan, æt. 8, a child of very delicate strumous temperament, was admitted, under my care, into the Meath Hospital, on the 24th of last June. The right elbow, which was evidently the seat of very extensive scrofulous disease, had been affected for upwards of nine months, and had commenced, according to the account her parents gave, apparently without any local exciting cause. The joint was enormously enlarged, the result apparently not so much of any extensive effusion as of great thickening and hypertrophy of the synovial and other soft structures. Though, in truth, in all such cases, when the disease is extensive, it is difficult, if not impossible, to define accurately what parts are chiefly affected. The integuments, especially on the posterior aspect of the joint, were much disorganised, and in three or four places had ulcerated, and, through the sinuous openings in these situations, oozed continually a thin, sanious, unhealthy-looking, purulent discharge. Through only one of these sinuses was I able to satisfy myself of the existence of diseased bone, namely, through the one situated over the head of the ulna. The patient did not suffer much pain in the joint except when it was moved. All power of flexion and extension was completely and entirely lost, and, in truth, at first sight, it was quite obvious that in the treatment of the case, looking at the large amount of disease that was present, the question to determine should be whether it was one for which the operation of amputation or excision should be performed. The latter I determined on, as being beyond all question the preferable alternative, having stated, however, previous to the operation, that should I find the amount of disease too great to justify resection, I should then have recourse to amputation of the arm. The operation, which was performed on the 25th of last June, was done in the manner I have frequently advocated, namely, by the vertical incision of Park, taking especial care in detaching the soft parts from the bones, to remove along with them, by some of the various ingeniously constructed instruments for the purpose, the fibrous envelope or periosteum. The advantages which I have pointed out as accruing from the adoption of the vertical incision are, first, that the suppurating surfaces are necessarily less in extent than when the ordinary H. incision is made, and that consequently the chances of rapidity of healing will be increased if the opportunity for suppuration be diminished. Secondly, that the numerous muscles in the neighbourhood of the elbow-joint are not divided transversely, and that, consequently, there can be no transverse cicatrix in their tissues, which would, in all probability, impede their action subsequently; and lastly, we avoid, by the vertical incision, the formation, of a transverse cicatrix, which, when it exists, impedes certainly the extension and flexion motions of the joint. In preserving the periosteum we have a two-fold purpose. First, to obtain a more natural appearance in the shape of the joint; and, secondly, which is far more important, to obtain a genuine re-formation of bone. The periosteal ablation I accomplished in this case by a periosteal raspatorium, devised, I believe, by Professor Langenbeck, and which was kindly given to me by Dr. O'Grady. As I have found it a most useful instrument in this and other cases where I have had to detach this membrane, I affix here [Fig. 1] a wood-cut of Langenbeck's periosteal raspatorium, and also of one [Fig. 2], devised by M. Ollier of Lyons, in order to give my readers a clear idea of their shape and construction.

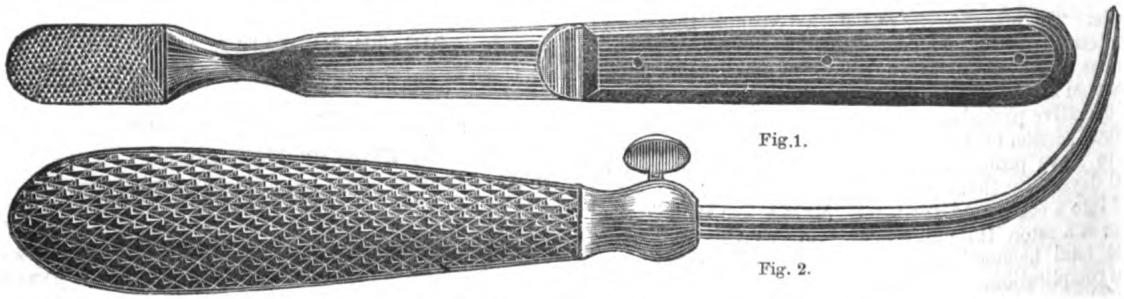

Fig. 1.

Fig. 2.

And here I would certainly join issue with MM. Sédillot, Sarazin, Marmy, and other of M. Sédillot's followers, who have asserted with more energy than reason the vast superiority of the method of *évidement* or "scooping" over sub-periosteal resection, practised in the manner I have described. M. Sédillot's theory is based on the belief that for the successful regeneration of bone, the preservation of the fibrous envelope of the bone is of less importance than its exter-

nal dense compact tissue. It is impossible, according to him, to remove the membrane from the diseased bone without seriously injuring or destroying its osteo genetic properties. He believes that the success of osseous regenerations depends on "two principal causes. First, the integrity of the periosteum; second, the regularity and immobility of the surfaces, sheaths, or moulds, in which the osseous matter is formed.

"Thus is explained the rapidity or slowness of the generation of bone, by the diverse degrees of alteration or distruction of the periosteum (by wound, inflammation, ulceration, suppuration, gangrene), and the immobility and regularity of the surfaces where the osseous cellules are deposited and agglomerated, serve to explain the superiority of the method of scooping (évidement) over that of subperiosteal resection, because in the former the mould is regular, immoveable, and invariable, and the periosteum intact, while, in the latter, this membrane is always more altered, sometimes destroyed, and the mould incomplete, mobile and irregular."*

Without entering minutely into the various objections, theoretical as well as practical, that might with good reason be urged against this theory, I may observe that the "évidement" to be performed in the manner indicated by M. Sédillot, presupposes, of necessity, a case in which the disease is localised, to a greater or less extent, in the central cancellated tissue of the bone; and, though it cannot be denied that this tissue is frequently, though not always, the primary seat of strumous disease, I would ask, is it not of extreme rarity that the surgeon has an opportunity of examining, after operation, a case of strumous disease of any of the joints in which it was localised in this situation? and were the surgeon enabled to diagnose such a case with accuracy, would he then be justified in recommending resection, when the disease was necessarily so limited in extent? In regard to the statement made by M. Sédillot, concerning the injury that is inflicted on the periosteum, which, in his opinion, has the effect of impairing, if not of destroying its osteo genetic properties, the best answer that can be given is, that the facts of a large number of recorded cases, as well as the results of extensive, physiological experiment, are entirely at variance with this purely theoretical objection.

To return, however, to the case which has suggested the above remarks. On opening into the joint I was at once struck with the limited extent of disease in the osseous tissues. It was, in fact, limited to the head of the ulna, but in this situation the cartilages were pulpy and thickened, and the bone soft and degenerated. Although the disease was so limited in the osseous structures of the joint, I had no hesitation in removing the ends of all the bones entering into its formation, as the results of partial excisions have been found to be so unsatisfactory. For example, the difficulty of getting proper union is very great in such cases, and when it is obtained it is usually by bony anchylosis instead of by fibrous tissue. The excision being performed, the edges of the wound were brought together by five or six points of silver suture, and a piece of oiled lint being introduced into the wound to serve as a vent for the purulent discharge, the limb was put in a semi-flexed position in a gypsom bandage. The arm was first enveloped with a flannel roller from the wrist to the shoulder, a large padding of French cotton having been placed over the wound, it was next covered with a coarse muslin bandage, into which I had previously rubbed some dry plaster of Paris powder. This bandage before being applied over the flannel one was moistened with tepid water. A layer of semi-fluid plaster was then laid over the muslin bandage, and this, when nearly dry, was covered with a second muslin roller, and the bandage was completed by laying on a second application of gypsom.

The following day I cut an oval window in the bandage over the wound, and having painted over the bandage with an etherized solution of Dammar Resin to prevent the action of the water softening the gypsom, I placed the limb in the continual bath. In this the arm was kept for twenty-two days. It was then taken out and put up in a felt splint, and the ulcerations, which existed previous to the operation, I commenced dressing with a solution of iodine in glycerine. The case has been progressing favourably ever since.

Reviews.

MEMORIAL STATUE OF SIR HENRY MARSH, Bart., M.D., in the Hall of the King and Queen's College of Physicians in Ireland, &c. Dublin: Printed at the University Press. 1867.

This handsomely printed and bound quarto volume, of pp. 19, with a well-executed Photograph of the late Sir H. Marsh, professes, on its title page, to be a "Memorial Statue" of a late eminent Dublin physician; but wherein it resembles a statue, except by a happy Hibernicism, it is very hard to say, seeing that the work before us is a *book*, whereas the result of Mr. Foley's labours is a beautifully executed statue in marble. It is, however, necessary to explain to the uninitiated that in this well-edited and beautiful volume they will find a full and true account of the "Inauguration" of the statue aforesaid in the Hall of the Dublin College of Physicians, on the 9th Nov., 1866—with a technical description of Mr. Foley's work of art. We have a report of the speeches of Dr. Banks, Dr. Stokes, Lord James Butler, Sir D. Corrigan, and others, on that occasion; and we understand that although the book was printed for the use of the subscribers, a few copies may be had on application to the Bedell of the College of Physicians, in Kildare-street, Dublin. The entire proceedings, it will be remembered, were fully reported in our columns at the time of the inauguration in 1866.

REPORT ON THE CHOLERA EPIDEMIC OF 1866, as Treated in the Mater Misericordiæ Hospital, Dublin; with General Remarks on the Disease. By Drs. Hayden and Cruise. Dublin: Fannin and Co. 1867.

In the *Dublin Quarterly Journal* for May, 1867, Drs. Hayden and Cruise published a long paper on this subject—having previously read a portion of it, which appeared in our own columns, before the Medical Society of the Dublin College of Physicians, during the "Cholera Meetings," held in Dublin in the earlier part of this year.

The work now before us is an 8vo pamphlet of pp. 66, and it professes to be a revised reprint from the pages of our contemporary. It is, however, in fact, a second edition of a very elaborate and exhaustive essay, and we need hardly say that we fully appreciate the labours of the writers, than whom no two Physicians better deserve the *imprimatur* of our Profession for their research, industry, and indomitable perseverance in the pursuit of Medical Science and practice. Every Medical man who reads anything knows "Cruise on the Endoscope," and our own pages frequently testify to the practical merits of his colleague, Dr. Hayden.

THE RETROSPECT OF MEDICINE, &c. Edited by W. & J. Braithwaite, M.DD. Vol. LV., January—June, 1867. London.

This volume is quite equal to any of its predecessors, and we notice it particularly at this time, because it gives ample evidence of the value of many of the Original Communications and Hospital Reports, which we have published during the period embraced in its pages.

The following papers, which appeared in this journal, on the dates below given, are summarised, or given more or less fully, in the current number of Braithwaite:—

Lyons, Dr.—Idiopathic Tetanus. Treatment by Tobacco and Nicotine.—5th December, 1866.

Tyrrell, Mr.—On the Treatment of Delirium Tremens by Indian Hemp.—13th March.

Lyons, Dr.—Delirium Tremens; Treatment by Capsicum.—19th December, 1866.

Lyons, Dr.—Case of pure uncomplicated double Bell's Paralysis.—19th December, 1866.

Sandham, Mr. W. H.—On Faradization and Galvanism.—30th January, 1867.

Marsh, Sir Henry, (the late), edited by Dr. Hughes.—Remarks on Chlorosis and Hæmorrhage.—6th May, 1867.

Marsh, Sir Henry, (the late), edited by Dr. Hughes.—On Epistaxis.—20th May, 1867.

Bamberger, Dr., (translated from the Norse, by Dr. W. D. Moore).—On Nervous Asthma.—13th February, 1867.

Dennan, Mr.—A Case of Resusciation after two hours apparent death by Drowning.—30th January, 1867.

Marsh, Sir H.—On the Treatment of Diabetes Mellitus.—16th January, 1867.

Bishop, Dr. Edwd.—On the use of Artifical Support in certain forms of Deafness ; with cases.—19th December, 1866.

Hinton, Mr. J.—Case of Restoration of a Perforated and Collapsed Membrana Tympani.—19th December, 1866.

Belcher, Dr.—On Porrigo.—5th December, 1866.

Lyons, Dr.—Syrup of the Phosphates—Iron, Quinine, and Strychnia.—19th December, 1866.

Lyons, Dr.—Chlorate of Quinia.—19th December, 1866.

CURRENT LITERATURE.

On the Treatment of Consumption, by Charles Thomason Thompson, M.D. (Hardwicke). This is a little pamphlet of twenty-nine pages, in which the author maintains that, by attention to the skin, the lungs may at once be relieved. He says that out of 200 cases treated on his plan only 20 deaths occurred. This plan seems to be for the most part cold bathing, and where hæmoptysis exists, ice to the chest. He expresses an earnest desire that his method may be tried by others, and that they should publish the results of their experience. We much doubt if any one will do this unless Dr. Thompson will first furnish a more detailed account of his plan, and fuller reports of his cases. He relates, indeed, some cases in a few general terms, but claiming to be able to cure consumption in such proportion, he must not be surprised at the profession expecting exact and full reports. Let us have full descriptions of the treatment and its results, and not be invited without these, to try the effect of "cool bathing," new or old as that remedy may be.

The Humidity of the Air of Scarboro', by Cornelius B. Fox, D.M. (Simpkin, Marshall, and Co.) The author confesses that the rain records of the town do not possess a great degree of authenticity. He has, however, furnished a very useful sketch of this department of Meteorology, and might very well have extended his little work to other kinds of meteorological observations in Scarboro'. Dr. Fox seems to be devoted to the subject of rain, for he heads each chapter with a quotation glorifying the downfall, and inscribes on his title page, "Sing unto the Lord, who covereth the heaven with clouds, who prepareth rain for the earth." We have a great fault to find with Dr. Fox. His little book is too cheap. The profits are to be given to the Scarborough Village Hospital, and we fear that charity will not be much the gainer ; for this neat little work, with plenty of tabular matter, is sold for ninepence. It is well worth a shilling, and we hope a second edition will soon give the author an opportunity of raising the price. If he would add an account of the temperature, and prevailing winds of the town, as carefully done as his rain statistics, he might conscientiously double the price.

The *Theory of Vital Force*, and the *Threefold Nature of Health and Disease*, by E. Haughton, M.D. (Churchill and Sons), have both lately reached us, although the former seems to have been published in 1862, and the latter last year. We presume the one is to illustrate the other. Dr. Haughton would seem to some extent to follow Dr. Chambers in the doctrine of the "Renewal of Life," and yet in some points to differ from him. We do not see that he has added much to Dr. Chambers's exposition, and to say that he had rivalled his master in the elegance of his diction or the art of making himself understood, would be flattering Dr. Haughton too much. We have read both his pamphlets with care, but are not so sure of our ground as we always are in any exposition by Dr. Chambers.

Messrs. Bailey and Son, of 17, Lawrence Pountney-hill, have issued a pamphlet on a *New and Simple Process for the Preservation of Meat, Poultry, Fish, and other Animal Food*. The process is patented by Messrs. Medlock and Bailey, and consists in immersion in "Bisulphite of Lime Solution," which is sold at an uniform strength by the patentees. It is urged that this plan will keep all animal food for an indefinite time in any climate. It will thus save enormous quantities of food hitherto wasted, and will enable ships to be constantly supplied, under all circumstances, with fresh meat.

De la Laryngite Chronique étudiée a l'aide du Laryngoscope, par le Docteur E. Nicolas. This is a brief but thoroughly practical paper on topical medication in certain forms of diseases of the throat. The cases are related, and the lessons they teach pointed out with that precision which is the charm of French clinical memoirs. We have read it with great pleasure, and we find that the practice of M. Nicolas quite accords with that we have found most useful. There are only sixteen pages in the pamphlet, but these contain more than many much larger books—that is, more really valuable clinical lessons. We take this opportunity of mentioning that M. Nicolas has translated into French Dr. M. Mackenzie's book on the Laryngoscope. We have already favourably reviewed the second English edition of this book, so that we shall only be expected to notice the fact of its having appeared in a foreign dress, as a sufficient confirmation of the opinion we have pronounced.

A New Process of Preparing Meat for Weak Stomachs, by W. Marcet, M.D., F.R.S. In this interesting little pamphlet, an accomplished chemist proposes to submit to a process of preliminary artificial digestion, the meat which it is desirable some invalids should take, but which they are unable to digest, on account of the pain it produces, or, on account of any morbid condition of the stomach. Full and explicit directions are given for making a sort of artificial chyle, by digesting in muriatic acid and pepsine at a proper temperature. The preparation can easily be made at the patient's house, and it is not unlikely it will supersede, in many cases, the use of beef-tea, as its nutrient qualities must be more complete.

Hirschfeld and Léveillé *on the Nervous System*, edited, in English, by A. M. Macdougal, F.R.C.S. Part II. London : J. Churchill & Sons. We noticed, some time since, the first part of this splendid work. When complete it will make a beautiful quarto atlas of coloured plates. The name of Churchill has long been a guarantee for the excellence of illustrated works, and it would be superfluous to repeat the admiration that we have several times expressed in this respect, of the spirit with which this firm engages in these costly but valuable series. The plates, under immediate notice, have long been known on the Continent as the very best of their kind. We are glad to direct attention to an English edition, and to add that the manner in which Mr. Macdougal conducts it, is worthy of the original. The work is to be completed in twelve parts, each of which will contain, on the average, six of these admirable plates.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 31, 1867.

THE LICENSE OF THE LONDON COLLEGE OF PHYSICIANS.

THE Membership and Fellowship of this College have been so thoroughly discussed in recent articles in this Journal, that we may be fairly expected to turn attention to the newer qualification. This seems especially desirable, since, at the present time, much excitement has been caused by a proposal to alter the bye-laws which regulate the bestowal of these

Licenses. Hitherto, candidates for the Licence, amongst other certificates, have had to produce one to this effect:—"Of having been engaged in Professional studies during four years, of which the first two years, and one other year, shall have been passed at a recognized Medical School or Schools, and of having attended the Medical Practice at a recognized Hospital or Hospitals, during two years of that period; and the Surgical Practice during twelve months; and of having been engaged during six months in the Clinical Study of Diseases peculiar to Women. The last of the four years of Professional Study must be passed at a Medical School, Hospital, Infirmary, or Dispensary recognized by the College."

Now, the point of the above regulation is, that the first two years must be passed at a recognized school, so that the student's education dates from the day of his actually commencing Hospital study, while one of the four years may be passed elsewhere. This regulation was, we believe, framed in accordance with the desire of the Medical Council, but has been found to work badly, and has therefore been abandoned by other examining bodies. The fact is, that gentlemen have long been accustomed to commence their Professional career before they entered a recognized hospital, and it certainly does seem hard that zealous work outside the select circle of authorized teachers should count for nothing at the beginning of Medical Education, but should be admitted as an interlude in Hospital work.

We believe that if extra hospital education is to be recognized at all, it should be at the commencement of the pupil's career. The fact is patent to every observer, that there are many subjects on which a student ought to be informed before he enters an hospital.

It is well-known to teachers in London, that the most promising students are those who have been private pupils of practitioners before they began the hospital curriculum. It has long been the strong point of the Apothecaries' Company, that an apprenticeship to a qualified practitioner, afforded the best possible introduction to the Profession. There are, indeed, many who despise the name apprentice, but even they can scarcely deny that a modified pupilage, such as is now accepted by the Company, affords an opportunity for acquiring practical knowledge that no other system can supply, and we could instance the names of some of the most eminent Physicians and Surgeons who, in educating their own sons for the Profession, have deliberately adopted the plan of putting them out as apprentices (or pupils if the word be preferred) for a term before entering them at the Universities. It would then seem unreasonable to insist on all work being ignored prior to the date of entry, at a recognised hospital or school. These should, in point of fact, be the places for finishing the education of the student, for assuredly these vast storehouses of information are more adapted for clinical and practical work than for the inculcation of first principles or the guidance of mere preliminary studies.

From the tenor of the previous remarks, it will be seen that if the alterations in the bye-laws be confined within these limits, we cannot condemn the change as injurious to the Profession, but if, as is believed in influential quarters, further modifications are to be attempted in order to make the license more popular, it may become a duty to adopt a decisive tone of remonstrance. The fact is, that the whole discussion arises from the useless desire to keep all College proceedings secret. There can be nothing more detrimental to the interests of the Corporation, than this private method of instituting organic changes. Both Fellows and Members of the College have a vital interest in every change, but only the former have a consultative vote. Until the latter obtain a voice, they will naturally feel a jealousy, lest the third order encroach upon them. This jealousy is also felt towards Members by the Fellows. Why is not some attempt made to do justice to all? The Members have few privileges not accorded to Licentiates, for the latter are many of them practising as pure Physicians, and against both law and custom, dubbing themselves doctors. There would seem to be no solution except drawing the line between general practitioners and Physicians, and surely every Member of a College of Physicians ought to have some voice in its affairs. This, at present, they have not. The Fellows only are consulted on the most radical changes, and they seem to care nothing for either Members or Licentiates, except to get their fees to spend on keeping up the dignity of their own order, and the privileges incidental to their own vested rights. And what are these vested rights? What—but the bane of all our Corporations? the right of taxing the majority for the benefit of the minority!

Notes on Current Topics.

The Late Sir William Lawrence.—Mr. Churchill has written to one of our contemporaries to say that he purchased the copyright of Carlile's publications, and afterwards was Sir William's publisher. He then points out the difference between the original edition and the pirated one, and fully endorses the statement of Sir Trevor Lawrence.

The Apothecaries' Society of London.—The list of members of this body will shortly be ready. It is usual to add to it a list of examiners, and sometimes the examination papers. We think the Society might very advantageously add to this a list of their licentiates. A very little extra expense would thereby be incurred, and the list

would be advantageously circulated widely. The Society has done so much for the Profession that we anticipate this hint will be immediately considered. It would be pleasant for every licentiate to receive a copy, and would probably add to the deservedly good feeling cherished towards the Society.

University College.—Some distinguished Graduates of the London University have lately been elected Fellows of University College. A correspondent is desirous of knowing what is the precise value of that honour. Does it confer any privilege, or is it merely an empty name for those who have studied at that institution? Is it confined to Graduates of the London University? Is any fee levied on election? Is the distinction much sought for, and, if so, why? With the Profession overloaded with various distinctions, the questions do not seem unreasonable. We therefore give them prominence, and offer any Fellow proud of his honour the opportunity of replying.

The Speech of Professor Beesly on the Sheffield Outrages.—The Council of the University College have decided by a majority of eleven to three not to make any movement respecting the speech of Professor Beesley at Exeter Hall, on the Sheffield outrages, which caused so much sensation. In so doing, the Council has only acted justly. It would be a blot upon a body like that of University College to attempt to regulate the opinions of its Professors. Why should a dissentient voice in a political question be less tolerable than on religious differences? Surely the principles of toleration on which the College is founded forbid intellectual, moral, and political tyranny, as much as sectarian despotism.

Surgical Qualifications.—A correspondence has taken place between the London College of Surgeons and the Glasgow Faculty of Physicians and Surgeons respecting an allegation in one of the journals, apparently emanating from some officer of the former corporation, that candidates rejected by the London College had frequently obtained diplomas at the Glasgow Faculty. The London College, of course, refuses information when challenged by the Faculty to furnish names as a proof of the statement. Nothing but the *non possumus* could have been expected. The profession will conclude that the Faculty of Glasgow has completely vindicated its reputation.

Charing-Cross Hospital.—A public distribution of prizes took place on the 19th ult.—the Right Hon. Sir F. Pollock in the chair. A complete change in the mode of working this charity is likely to be effected. The alterations in the rules have in fact passed the preliminary stages. We believe that an effort will be made to render new appointments of officers more equitable, and that special departments will be organised in the best possible manner. The following is a list of the prizes distributed:—

"For General Proficiency: gold medal, Mr. W. Powell. The Governors' Clinical Prize: silver medal, Mr. Alcock. Anatomy (senior; Mr. Barwell): silver medal, Mr. W. P. Adams; certificates, Mr. Hugo and Mr. C. E. Little. Anatomy (junior): bronze medal, Mr. W. H. Pearce; certificate, Mr. Biddle. Physiology (senior; Dr. Tonge): silver medal, Mr. Thornycraft; certificates, Mr. Hugo (1st) and Mr. W. P. Adams (2nd). Physiology (junior); bronze medal, Mr. S. T. Conolly; certificate, Mr. Towt. Chemistry (Mr. Heaton): certificates, Mr. Aubrey (1st) and Mr. Conolly (2nd). Medicine (senior; Dr. Hyde Salter): silver medal, Mr. W. C. Calthorp; certificate, Mr. Alcock. Medicine (junior): bronze medal, Mr. W. H. M. Smith; certificate, Mr. H. Skelton. Surgery (Mr. Canton), senior: silver medal, Mr. R. Alcock; certificate, Mr. Calthorp. Surgery (junior): bronze medal, Mr. Towt; certificate, Mr. Pearce. Materia Medica (Dr. Headland): silver medal, Mr. H. Skelton; certificates, Mr. C. E. Little (1st) and Mr. Hugo (2nd). Forensic Medicine (Mr. Hird): silver medal and book, Mr. Calthorp; certificate, Mr. Alcock. Obstetric Medicine (Dr. Parson): silver medal, Mr. Thornycraft; certificates, Mr. Alcock (1st) and Mr. Buck (2nd). Botany (Dr. Silver): silver medal, Mr. Little; certificate, Mr. W. P. Adams.

Honorary Degrees.—We understand that, in addition to the degrees of Doctor of Medicine *honoris causâ*, which will be conferred by the University of Dublin on Sir J. Simpson, Mr. Syme, and Mr. Rumsey, of Cheltenham, and others, at the special commencements to be held in connection with the meeting of the British Medical Association, the King and Queen's College of Physicians propose to confer the distinction of their Honorary Fellowship, amongst others, on Dr. Falconer, of Bath; Dr. Greame, Dr. Greenhalgh; Dr. Markham, and Mr. Lockhart Clarke.

Transmission of Purpuric Fever from the Pig to Man.—The analogy between the "purples" in the pig and the malignant purpuric fever in the human subject was first publicly noticed by the Registrar-General in his mortality returns for London. Dr. Lingen, of Hereford, corroborates that view in the communication which we publish in another column. It appears that the pig died on the 18th of May, with all the symptoms of "purples." About the same time a servant-girl was taken ill, but with no symptoms to identify the disease. The landlady on the 31st was attacked with cerebro-spinal symptoms, with purpuric spots, and with a great pain in the right forearm. On the same day, the man who had buried the pig was attacked with exactly similar symptoms, but without the spots, and died three days subsequently. The indications in these patients were not so distinctive of either cerebro-spinal or purpuric fever as to put the diagnosis beyond doubt. Nevertheless, the coincidence, if it were nothing more, is very remarkable. We believe that many cases of this disease in the pig occurred near the Curragh Camp, but connection between them and the affected persons in the Camp was not traced.

Sympathy in Disease.—There is no subject in the domain of pathology more worthy of close and philosophic research than that of sympathy, which Mr. Macilwain treats of in another part of our issue to-day. Abernethy was the first observer who remarked on the fact that the organ which was the seat of the disease was not necessarily the seat of the symptoms, and Mr. Macilwain points out that this is the general rule of all sympathetic disorders. He remarks on the electric sympathy between different organs of the animal system which, while absolutely essential to the animal economy, is apparently inconsistent with the known laws of sympathetic connection. The investigation on which Mr. Macilwain has entered, is of cardinal importance, because it strikes at the root of all empirical practice which treats symptoms, while it ignores the cause, and if these considerations receive the attention which they appear to deserve, a great revolution must take place in existing principles of therapeutics.

ABORTION IN AMERICA.—The State Assembly of Rhode Island have, to their credit, been the first to take measures for the suppression of the abominable crime of fœtal murder, now prevalent in the United States, and have, with that object, passed an Act in their last Session. The Act provides that "every person who shall be convicted of wilfully administering," or who shall "employ any means whatever with intent thereby to procure a miscarriage, or of aiding, assisting, or counselling thereto, unless the same is necessary to preserve life, shall, if the woman dies, be imprisoned for not more than twenty, and not less than five years, or, if she do not die, for not more than seven years, provided always that the woman herself shall not be liable to these penalties." Another section provides that whoever knowingly advertises, prints, publishes, or circulates any paper or advertisement, containing any notice, hint, or reference, by which information or knowledge may be obtained for causing abortion, shall be imprisoned for not more than three years. The American medical periodicals teem with authentic instances of abortion or the attempt to procure it, and the New York *Medical Record* publishes a case in which a beneficed clergyman endeavoured to persuade a medical man to bring about a miscarriage in his own wife, *because she was going on a sea voyage, and he did not wish her to be confined on board ship.*

THE ICE-BAG IN SEA-SICKNESS.—In another column will be found a letter from Dr. Chapman, who generously offers to send spinal ice-bags to medical men about to cross the Irish Channel in order to be present at the Meeting of the British Medical Association in Dublin, and thus to enable them to test the efficacy of his proposed remedy for sea-sickness. We adverted, a few weeks ago, to the nature and *modus operandi* of this remedy; we showed that it originated in a thoroughly scientific appreciation of well-established physiological facts; that its success appears to have been demonstrated by a considerable number of experiments; that every person who has availed himself of it testifies not only to its efficacy but to its surprising comfort and agreeableness while used, and we called upon the profession to use their influence to get its value thoroughly tested and ascertained. Dr. Chapman, in his letter, suggests that medical men going to the meeting of the British Medical Association at Dublin, or to the Medical Congress in Paris, should do this, and offers to supply them with the apparatus for their experiments; we earnestly hope, therefore, they will accept his proposal and will report the results; for, obviously, if the simple means he proposes will really arrest sea-sickness, no time ought to be lost in proclaiming the removal of this distressing malady from the catalogue of incurable diseases.

THE PUBLIC HEALTH.—The deaths registered in London during the twenty-ninth week of the year were again below the average number. Calculating for the increase of population, there were 225 less deaths than the estimated number for the week. It is to be noted, however, that diarrhœa continues to increase—the deaths from this disease in the last four weeks having been 48, 54, 115, and 170 respectively. Of the 170 in last week, only 8 were deaths of adults, the remaining 162 being those of children. Even the present numbers are not so alarming as many think. In the corresponding week of last year the deaths from diarrhœa were 221, besides 346 from cholera. The annual rate of mortality during the week was 21 per 1000 in London, 29 in Edinburgh, and 19 in Dublin; 16 in Bristol, 24 in Birmingham, 27 in Liverpool, 29 in Manchester, 25 in Salford, 18 in Sheffield, 24 in Leeds, 22 in Hull, 23 in Newcastle-upon-Tyne, and 27 in Glasgow. The rate in Vienna was 28 per 1000 during the week ending the 13th inst., when the mean temperature was 0·1° Fahrenheit lower than in the same week in London, where the rate was 21.

CONVALESCENT HOSPITAL.—The directors of St. George's Hospital are enabled, by a princely benefactor, to extend its usefulness by the erection of a convalescent hospital. Mr. Atkinson Morley, proprietor of the Burlington Hotel, in Cork-street, willed his entire property to St. George's, with the direction that the interest should accumulate for five years, at the end of which time the whole would amount to about £150,000. In 1865 this sum was paid over to the hospital, and out of it they have bought twenty-eight acres of ground at the south-west corner of Wimbledon-common, where the intended convalescent hospital is to be built, the first stone of which was laid on Thursday. The wards are to accommodate 100 patients.

Foreign Medical Literature.

CASE OF OSTEOMYELITIS SPONTANEA DIFFUSA.

By P. THILESEN.

TRANSLATED FROM THE NORSK MAGAZIN FOR LÆGEVIDENSKABEN, XXI. BIND, I. HEFTE, CHRISTIANIA 1867, P. 3.

By WILLIAM D. MOORE, M.D., Dub. et Cantab., M.R.I.A.;

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS; OF THE NORWEGIAN MEDICAL SOCIETY; AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; SECRETARY FOR SWEDEN, NORWAY, AND DENMARK, TO THE EPIDEMIOLOGICAL SOCIETY OF LONDON.

THIS case, which was admitted in the beginning of 1864 into the Medical Division of the Royal Hospital, with the diagnosis of aneurism of the aorta, should have been reported among the other cases which constituted the last part of my hospital report. The journal was, however, at that time mislaid, and was only within the last few days quite accidentally found. As the case presents great interest, both as a singularly fully developed example of this disease, which has only of late years been more closely studied, and on account of its, in some respects, rather unusual course, and the diagnostic difficulties with which it was, at all events in the commencement, surrounded, and which gave rise to the erroneous view at first entertained, which was never completely rectified by any of the medical men who had occasion to examine it, I did not wish to lose the opportunity, when the journal was again suddenly found, of recording it. But so long a time has now elapsed that it will unfortunately not be possible for me to complete from memory the rather imperfect report, as at an earlier period I might have done. Nevertheless, what is wanting, desirable as it might have been to be in possession of it, is not so considerable or essential as to render it necessary to hold back the case.

Alvilde Carlsen, aged 14, was admitted into hospital on the 24th of April, 1864, and died there on the 6th of May. The investigation of her former state, undertaken with a view to ascertain especially whether there had been at any time signs of any affection of the heart, lungs, or large thoracic vessels, according to the journal, elicited nothing. The patient seems always to have been healthy, until some weeks before her admission into hospital.

After having for some days had a slight excoriation on the second toe of the right foot, she danced three weeks ago in a pair of tight boots. The next day the toe swelled and pained her in walking. However, the swelling, and,

as it seems, the pain and tenderness disappeared after the lapse of a couple of days, whereupon she began to feel pricking pains in the thigh and groin, particularly when she walked. Whether these last painful sensations were developed gradually during, or immediately after, the affection of the toe, or whether after the latter was well, they occurred quite suddenly, I cannot say. In the journal is found only what I have above quoted, and after so long a time I cannot recollect whether, on subsequently examining the mother and daughter, I obtained any more definite statement from them. But, from the following expression, it would appear that the pains had occurred rather very suddenly than the reverse:—"Next day the right lower extremity, particularly the thigh, became swollen." It is stated that at this time there was great tenderness on pressure over the whole leg, but especially in the popliteal space, the groin, and a point in the middle of the thigh; every movement of the extremity pained her excessively, so that she was obliged to lie perfectly still with the limb flexed in the hip and knee-joints, and rotated outwards. No change seems to have been observed in the colour of the skin of the extremity.

At the same time she began to have great thirst, and lost her appetite. When she endeavoured to raise herself in the bed she usually got a rigor over the whole body, unaccompanied with any feeling of cold; on the contrary, she perspired rather freely and uniformly. Her nights were almost sleepless, with occasional delirium. Eight or nine days ago, that is rather less than a fortnight after the commencement of her illness, stitch-like pains supervened, passing from the middle of the sternum to the back. Nothing is stated more particularly respecting these pains, and especially nothing which might indicate any local or thoracic affection. According to the journal this state continued unaltered until six days ago (that is rather more than a fortnight from the commencement of her illness), when, in the course of the night, violent cough set in, with scanty, colourless expectoration, and great dyspnœa. *Later in the day her mother observed a strongly pulsating tumour in the middle of the sternum*, which must, apparently, have formed very suddenly, as both she and the patient positively assert that it was not previously to be seen. This tumour is said to have varied somewhat in size. About the time it was observed the patient remarked a weakness in the left upper extremity, so that she could only most imperfectly move the fingers and forearm, while every movement, whether active or passive, of the elbow and shoulder joint caused great pain. The bowels were at first regular, subsequently constant diarrhœa set in, with four or five, thin, green, and chopped-looking, extremely fœtid stools in the twenty-four hours.

On her admission into hospital she looked very pale and exhausted. She complained particularly of pains over the sternum and in the back, which were aggravated by cough or any movement of the body. There were violent dyspnœa (respirations fifty-six in the minute), cough, with frothy white expectoration, and palpitations. The weakness in, and the pain on movement of, the left upper extremity were considerably less. Here there seemed to be no change of sensibility, no tenderness on pressure except over the shoulder joint. The right lower extremity was swollen in its whole extent, slightly over the foot and leg, more so over the thigh. The os femoris was tumefied in its lower half, whether it was swollen also further up could not be accurately determined, as the integuments were very thick, rather swollen, and extremely sensitive on deep pressure. The tenderness extended further over the entire length of the thigh, though it was, perhaps, most strongly marked in the groin and in the middle. The skin was tolerably hot, but was scarcely more highly coloured than on the other side. Along the inner surface of the thigh, apparently in the line of the vessels, a tense cord, as it were, was felt. The limb was kept flexed in the hip and knee joints, was strongly rotated outwards, which could not be altered, any attempt to do so being attended with intolerable pain.

On the anterior surface of the chest, in the middle of the sternum, was seen a tumour of a somewhat oblong form, with its longest diameter passing obliquely from rather outside the right sternal margin upwards and outwards to a little outside the left sternal margin. From above downwards it extended from the upper edge of the sternal insertion of the second rib to a line drawn on a level with the nipples. The skin on the tumour was traversed by bluish veins, was of the usual colour, not hot, rather thin. There was extremely distinct superficial fluctuation and strong pulsation, but the impulse was flaccid and soft. No particular pain on manipulation of the tumour; when the finger was brought more deeply under the tumour, the sternum was felt everywhere, and especially superiorly and inferiorly, to end in a sharply cut off margin; the bone seemed to be there totally deficient. The tumour yielded in its entire extent a dull sound, around it the sound was clear. The cardiac sounds were pure at the apex. Over the tumour a soft blowing sibilant sound, isochronous with the first sound of the heart, was heard. The sounds were transmitted only a short way upwards in the carotid. The pulse was 130, and was isochronous with the heart's impulse. The pulsation in the peripheral arteries was normal in strength and chronological order. Posteriorly in the middle portion of the right lung the sound on percussion was dull, and there was a soft bellows murmur.

Iodine was applied over the thigh and shoulder, and in the course of the following days a couple of incisions were made on the outside of the thigh, after which, especially after the last, a quantity of thin pus, mixed with blood, was discharged; a very good discharge took place through a drainage tube passed between the two incisions to the bottom of the subjacent abscess. The rest of the treatment consisted essentially in endeavouring to support the strength.

The patient's condition, on her admission into hospital, was already hopeless. Her strength rapidly diminished, particularly under the increasing diarrhœa and the total want of sleep at night. She raved day and night, until at last she fell into a completely comatose state, in which she died on the 6th of May, about a fortnight after her admission to hospital, and as nearly as possible five weeks after the commencement of her illness.

The disease was, as has been stated, at first looked upon as aneurism of the aorta, and with, but independently of the same, periostitis femoris. I also thought it possible that the disease might be another kind of affection of the bone, and that in such a case a definite connection existed between it and the supposed aneurism. Thus Richard Volkmann* calls attention to a peculiar connection between cardiac disease and affections of the bones, particles of deposits on the valves of the heart becoming impacted in the minute arteries of the bones, and giving rise to necrotic and other processes. Aneurisms of the aorta might certainly in this respect have the same influence.

Even from the first glance the diagnosis made by the examining candidate was not very satisfactory. The symptoms derived from the tumour itself were not the most characteristic of aneurism of the thoracic aorta. What was wanting was certainly not so essential, that we might not, in some modifications of this disease, find the symptoms developed in this little indicative mode. But when, in addition, we had the singular mode of development of the tumour, the state of the bone at the seat of fracture, the total absence of the symptoms of any earlier affection of the thoracic organs, and, finally, the course of the whole disease, the existing slight deficiency in the symptoms acquired a totally different and increased significance.

Although all this, at the first view, stood clearly before me, I could not avoid the impression which this pulsating tumour gave, and the disease was therefore, notwithstanding the existing doubt, set down as aneurism of the aorta and

* Langenbeck's Archiv, B. 5, p. 330.

periostitis femoris. It was only when, a few days after the patient's admission, a colleague, who saw the case, expressed the same doubt as to the correctness of the diagnosis, based upon the same circumstances as are above referred to, that I found myself in a position to get rid of the first impression, and adopt another opinion. In the hopeless state of fully developed pyæmia, in which she was on her entrance into hospital, this mistake did her no harm. Earlier in the course of the disease the error would have been of much greater importance, but to be sure it would then, at least before the development of the tumour, have been less easy to fall into it. The diagnosis now made was, as the post-mortem examination showed, approximatively correct. It was now thought that we had to do with a *periostitis purulenta acutissima*—periostitis maligna, as it is also sometimes called, to be distinguished from the general, more benign periostitis purulenta, a form of disease in which, in a comparatively short time, a thin, fatty, fœtid pus is formed under the periosteum, in the tissue of the same, and externally in the soft parts, which, in a shorter or longer period after its formation is absorbed (we have examples of this occurring in twenty-four hours after the commencement of the disease), and gives rise to pyæmic and septicæmic conditions, with sudden collapse of the strength, and death. The idea of osteomyelitis did not occur to me, chiefly, no doubt, because the disease is still so little generally known, and even if I had thought of the possibility of its presence, it would have been almost impossible, in its then stage, to say decidedly which of these affections would be found in this case.

I shall venture briefly to state what I have above touched on as having raised a doubt in my mind as to the diagnosis of aneurism. The strong pulsation, which was seen and felt over the whole tumour, had rather a passive character, consisted rather in a heaving and sinking of the tumour, than in an undulating, more active contraction, from which one gets the impression that it is actual aneurismatic pulsation. But where the aneurism is of the mixed sacciform kind, with its walls formed merely of the dilated outer membranes, and communicates only with difficulty by a small opening with the cavity of the vessel, the aneurism is rather to be considered as a tumour external to the artery, and would probably sometimes present such a less characteristic pulsation. The accessory sound, which was heard over the tumour, had not the sharp, rough clang, which is often perceptible to the hand as a feeling of vibration and purring, was not heard like grating, rasping, or filing, but was more a simple, soft, blowing, accessory sound, such as a gentle pressure on the artery, a slight obstruction in the circulation can produce.

Notwithstanding these *lacunæ* in the existing symptoms, the case might have been one of aneurism of the aorta, if there was nothing else to prevent the assumption that it was such. Thus there was no change observable either in the size or chronological order of the arterial pulse below the aneurism compared with the heart's impulse. All was in this respect normal. In the next place, an aneurism of the size would scarcely have existed without perceptible signs of coagula and depositions in the sac, which, in this instance, was found to be quite thin, and, with corresponding fluid contents, almost of the consistence of water. Rapid as we might have imagined the development of an aneurism to be, even if we assented to the not very probable statement of the mother, and supposed that it had formed by a rupture of the two inner coats during excessive dancing, it must still have been possible, in the space of two or three weeks, during which the tumour was said to have existed, for depositions to have formed in the sac; it could scarcely be supposed, taking the mode of origin and the time it had existed into consideration, that the communication between the sac and the artery should be so enormous that the total contents of the former should, at every pulsation, be completely emptied into the artery, and at each contraction of the heart be again as completely renewed, which would seem necessarily to be the case to have the contents of the sac such as they were; moreover it might objectively be proved that no such complete emptying and filling took place. The defect in the bone had, besides, by no means the character of a slowly progressive corrosion of the same. The edges of the aperture were sharply defined; so far as could be ascertained, they were of the normal thickness of the bone, as if chiselled out in the sound sternum. Strong as the pressure produced by an aneurism might have been, it could not possibly have produced such acute destruction of a, so far as can be seen, previously entirely healthy bone. In looking for a cause we must in this case necessarily refer to an acute disease in the bone, which has in a very short time been competent to weaken its power of resistance to a fluid of less indifferent nature than blood collected behind it. The course of the whole disease testifies also in the most decided manner against the diagnosis. Never before had the child exhibited the slightest sign of any affection of the thoracic organs, the heart, lungs, or great vessels. Of the correctness of this no doubt can be entertained, the examination both of mother and child was too searching, and was repeated too often to admit of any question on the subject. Nor was the child's age in favour of any chronic degeneration in the wall of the aorta—affections of such a class belong rather to somewhat more advanced years Lastly, the disease had begun in an acute form three weeks before the patient's admission, with symptoms referrible to the right lower extremity, and it was not until about a fortnight later that any sign of affection of the chest manifested itself. To establish the diagnosis of aneurism we must look away from all this, do violence to the phenomena, unnecessarily separate the complex of symptoms which suit one another well, into two groups, wholly independent of each other, while all can be freely and naturally explained by the hypothesis of an acute, malignant affection of the bone, with secondary pyæmic symptoms; but so strong was the impression on the mind produced by the existence of the pulsating tumour, that all this was done.

The mother stated that she had before lost a child with perfectly similar symptoms, and at about the same age. An elder sister looks very cachectic, suffers from psoriasis, and the whole family bears the stamp of debility. It is therefore possible that a cachexy has had something to do with the origin of this affection, so far as the disposition is concerned, and that thus only a slight external cause was required, to produce the disease.

As to the frequency of the disease in this country I have nothing to say. Once before I believe I met with it. A good many years since I had a boy in hospital, aged eleven or twelve years, who had for many years been under the so-called English doctor's treatment for an affection of the thigh; the symptoms, as I now remember them, seemed to have been about the same. In this boy a solution of continuity took place during the progressively destructive process in the femur.

(To be continued.)

Examination Papers.

UNIVERSITY OF DUBLIN, TRINITY COLLEGE. EXAMINATION FOR MEDICAL DEGREES.

Botany.—Dr. Dickson.

1. What is the difference between a true and adventitious root?
2. Give an example of a plant climbing by its roots.
3. Where do stomata principally occur, and what is the effect of turgescence of the stomatic cells by absorption of water?
4. What is the nature of an interpetiolar stipule?
5. What is the difference between a pike and a capitulum?

6. What peculiarity in the insertion of stamens usually accompanies a gamopetalous condition of the corolla?

7. Name the structure of stem usually associated with recticulated venation in the leaves?

8. What is meant by the term *monadelphous* as applied to stamens?

9. Give the general character of the natural family. Umbelliferæ as to *leaves*, *inflorescence*, *corolla*, *ovary*, and *fruit*.

10. State the order and sub-order of the plant before you: describing the structure of the fruit, and the peculiar condition of the stramens in the plants of this family.

INSTITUTES OF MEDICINE.—DR. LAW.

1. What are the requirements of the Economy to which food ministers?

2. To meet these requirements fully, what should be the constitution of the food?

3. Is their any single alimentary substance that contains all the ingredients required for supporting life?

4. What error does the term Asphyxia involve as applied to the mode of death to which this term is ordinarily applied?

5. What do you understand by Thrombosis?

6. What do you understand by Aphasia?

7. Where in the brain is the lesion usually found in Aphasia?

8. Describe the modifications of the respiration in a case of acute pleurisy terminating in effusion, and in which the fluid is eventually removed. Describe also the decubitus of the patient through the stages in acute pleurisy.

9. What circumstances would make you resort to the operation of paracentesis thoracis in acute pleurisy?

10. What are the causes under the influence of which dropsy occurs in the animal body?

SURGERY.—DR. R. W. SMITH.

1. What is meant by the "hæmorrhoidal flux"? Mention its causes and treatment.

2. Mention the organic diseases with which hæmorrhoids are found associated. Describe the treatment of what is termed a "fit of the piles."

3. Distinguish between hæmorrhoids and the hæmorrhoidal excrescence.

4. Describe Amussat's operation for making an artificial anus.

5. Give the pathological characters of an artificial anus, the result of strangulated hernia.

6. What are the causes of *acute* inflammation of the prostate gland?

7. What causes produce abscess in the axilla? Mention the varieties of axillary abscess. What form of the disease is most dangerous?

8. Describe the symptoms and varieties of luxation of the first phalanx of the thumb forwards.

9. What modes of treatment have been proposed for the cure of bronchocele? Give the particulars of Cline's case.

10. What are the signs of fracture of the neck of the scapula? Distinguish this injury from others that resemble it.

MIDWIFERY, &C.—DR. SINCLAIR.

1. Describe the various forms of extra-uterine fœtation. Give the diagnosis, the treatment, and explain the symptoms in the three following cases:—

2. Case I.—A woman has been for some time in the second stage of labour; the head presents, and is engaged in the upper half of the true pelvis; uterine action is powerful; during a pain there is a sudden and momentary increase of suffering to an intense degree, immediately followed by collapse, cessation of action, complete recession of the presentation, and rather profused hæmorrhage.

3. Case II.—One perfectly similar to Case I. with the exception that there is the recession of the presentation is incomplete.

4. Case III.—One perfectly similar to Case I., with the exception that *no recession* of the presentation, and no visible hæmorrhage.

5. On what principles did Sir James Simpson recommend version in certain cases of narrowing of the conjugate diameter of the brim of the pelvis? State also anything you may know relative to the history of version in connection with pelvic narrowing.

6. Abortion has occurred at the fourth month of gestation; the fœtus has been expelled, but the shell of the ovum remains in utero. What are the dangers of such a condition, and how would you treat such a case?

7. Granted that the placenta is retained from morbid adhesions, how would you be led to distinguish complete from partial adhesion; and what treatment would you adopt under either condition?

8. How would you distinguish the substance expelled during a certain form of dysmenorrhœa from that of an early ovum; and what is the nature of this substance?

9. What is the difference between retention and suppression of the menstruation—the varieties of the former, and their treatment?

10. Write a recipe for a woman who complains of violent after pains, and consequent loss of sleep; state also what other means you would adopt to assuage their severity?

MEDICAL JURISPRUDENCE.

ROBERT TRAVERS, A.M., M.B.

1. Distinguish the tetanus of disease, or consequent on lesions, from that caused by a strychnic poison.

2. Why are not the means hitherto proposed for the detection of chloroform in the blood to be accepted as sufficient?

3. Antimony and arsenic being both present in solution in a fluid containing organic matters, how will you detect and exhibit them separately?

4. On what circumstances observable in anatomical inspection will you depend as proving that the death of the infant during the period of lactation was caused by the privation of food, and not by any diseased condition inducing atrophy?

5. What principles of treatment would guide you in cases of poisoning by phosphorus?

6. By what means would you render the iron contained in the colouring matter of the blood available in the discrimination of stains on the surface of cutting instruments?

7. By what pathological characters in the dead body can you distinguish narcotic poisoning from apoplexy?

8. By what characters will you recognize death from hæmorrhage, in the new-born child?

9. What circumstances in a wound serve to prove that it was suicidally inflicted?

10. In what cases may death be the result of violence leaving on the body no appreciable trace of lesion, either superficial or deep-seated?

THE CONVERSAZIONE AT THE ROYAL COLLEGE OF PHYSICIANS OF LONDON ON WEDNESDAY, JULY 24, 1867.

THIS entertainment may be safely pronounced most successful. Soon after nine o'clock, the time fixed on the invitation cards, the rooms were filled with visitors, who evinced considerable interest in the various objects of interest that had been brought together. The objects exhibited included:—Portrait of Sir Thomas Watson, Bart., by George Richmond, R.A.; Crouch's Binocular Microscope, with Nachet's Stage, exhibiting specimens of Eozoon Canadense, by Dr. Carpenter; Twelve Slides of the Soft Tissues, prepared at the Army Microscopical Department, Washington, U.S., by Dr. Maddox; Section of Sheep's Kidney, injected with Prussian Blue, and subsequently coloured by Carmine to show Renal Tubes, by Dr. Southey; Collection of Specimens, illustrating the *British Pharmacopœia*, 1867, by Professor Redwood; Specimens of Aconitine, Meconine, Resin from the Seeds of Hyoscyamus, &c., also drawings and works of art, by Messrs. Morson; Extra Pharmaceutical Preparations, by Messrs. Savory and Moore; A new Medica

Lantern, and its application in Rhinoscopy and Laryngoscopy, Dr. Thudichum; Model of Ladd's Dynamo-Magneto Machine, by Mr. W. Ladd; Micro-Spectroscopes, with novel Specimens, prepared by H. C. Sorby, F.R.S., Sorby's Standard Interferences Spectrum, and New Spectrum Telescope, by Mr. Browning; Instantaneous permanent Photographs, enlarged Photo-micrographs, Medical Portraits, and miscellaneous, with an engraving of Barraud's "Hyde Park," by Mr. Ernest Edwards.

The visitors were received in the first room by the President, Dr. Alderson, in front of the portrait of Sir Thomas Watson, which excited much admiration.

In the small library adjoining, the action of sound upon jets of gas, as in the experiments of Professor Tyndall, was exhibited by Mr. Cottrell. The room was filled with a succession of visitors the whole evening, this apparatus proving one of the most interesting of the many amusements provided. The other articles in the programme were displayed in the large library. The sublimates of the alkaloids, and their photographs, called forth many expressions of pleasure. Dr. Thudichum's new medical lantern, made by Mr. Orchard, was for a long time closely surrounded by so large an audience that it was difficult to see it. The light is excellent, and obtained by projecting oxygen gas into the flame of a lamp playing upon lime. It is needless to say that all the microscopes, and microscopic specimens, were of the choicest kinds.

The Pharmaceutical preparations were also the finest specimens of the eminent firms who exhibited them. Among the *extra* drugs of Messrs. Savory and Moore, we may instance pancreatic emulsion and pancreatine, a compound syrup of phosphates or chemical food, and cod-liver oil combined with various drugs.

In the large room below, the College had provided refreshments for its numerous visitors. Here, also, everything went off in a most satisfactory manner. In all directions we have heard only expressions of pleasure at the opportunity afforded by the College for an agreeable professional *reunion*.

NATIONAL ASSOCIATION FOR THE PROMOTION OF SOCIAL SCIENCE.

THE eleventh annual meeting will be held in Belfast, from Wednesday 18th, till Wednesday, 26th September, 1867.

President.—The Right Hon Lord Dufferin and Clandeboye, K.P., K.C.B.

President of the Council.—The Right Hon. Lord Brougham.

Presidents of Departments, &c.—Jurisprudence: The Right Hon. Mr. Justice O'Hagan. Repression of Crime (Section): The Right Hon. The Master of the Rolls. Education: Thomas Andrews, M.D., F.R.S. Public Health: Sir James Y. Simpson, Bart. Social Economy: Sir Robert Kane, F.R.S. Trade (Section): John Mulholland, J.P.

General Secretary—George Woodyatt Hastings, Esq.

Foreign Secretary.—John Westlake, Esq.

Treasurers.—W. Strickland Cookson, Esq.; William Hawes, Esq.

Chairman of Local Executive Committee.—Professor Wyville Thomson, LL.D., J.P.

Local Secretaries—Professor Nesbitt, M.A., Queen's College, Belfast; W. Quartus Ewart, Esq, Donegall-place, Belfast; Henry Murney, M.D., J.P., Donegall-square East, Belfast; J. Arnott Taylor, Esq., Bridge-street, Belfast.

Local Treasurer.—W. J. C. Allen, J.P., Ulster Bank.

General Office of Association.—1, Adam-street, Adelphi, London, W.C.

Local Office.—Queen's College, Belfast.

LOCAL EXECUTIVE COMMITTEE.—*Chairman*—Professor Wyville Thomson, LL.D., J.P. William Bottomley, J. P.; Theobald Bushell, J.P.; W. Neilson Hancock, LL.D.; Henry Murney, M.D., J.P.; Joseph John Murphy, Esq.; Professor Nesbitt, M.A.; Robert Patterson, F.R.S.; Elias H. Thomson, Esq.; W. J. C. Allen, J.P., *Treasurer*. J. Arnott Taylor, Esq., *Hon. Secretary*.

DEPARTMENTS, AND SPECIAL QUESTIONS FOR DISCUSSION.

PUBLIC HEALTH.

President.—Sir James Y. Simpson, Bart. *Vice-Presidents.*—Professor Apjohn, M.D.; Samuel Browne, R.N.; William Dunville, J.P.; John Hancock, J.P.; Henry Mac Cormac, M.D.; William M'Gee, M.D., J.P. *Secretaries for Belfast Meeting.*—Professor Cuming, M.A., M.D., Wellington-place, Belfast.—(For Strangers.) James Girdwood, J.P., Clonaver, Strandtown.—(For Town.) Professor Redfern, M.D., 4, Lower Crescent, Belfast.—(For officers and papers.) *Permanent Secretaries.*—William Hardwicke, M.D.; William Rendle, Esq.

SPECIAL QUESTIONS FOR DISCUSSION.

1. What measures are necessary to secure efficiency and uniformity in the working of the Sanitary Laws throughout the kingdom?

2. In what respects do the Registration systems of England, Ireland, and Scotland need improvement? and is it desirable that they should be assimilated?

3. In what form, and to what extent is it desirable that the Public should provide means for the Recreation of the Working Classes.

The following ,are also suggested as suitable subjects for Voluntary Papers:—1. Improvement of the Dwellings of the Labouring Class. 2. The supply of Trained Nurses. 3. Town and Domestic Water Supply. 4. Infantile Mortality.

JURISPRUDENCE AND AMENDMENT OF THE LAW.

President.—Right Hon. Mr. Justice O'Hagan.

SECTION A.—(INTERNATIONAL LAW.)

Secretaries for Belfast Meeting.—David Ross, LL.B, Eccles-street, Dublin.—(To communicate with Strangers.) William Mulholland, Esq., 1, Portland-street, Dublin.—(To communicate with officers, and with reference to papers.) Andrew M. Porter, Esq., College-square East.—(For town arrangements.)

SPECIAL QUESTIONS FOR DISCUSSION.

1. Is it desirable that there should be an International Currency? and, if so, on what basis?

2. Is it desirable to establish a general system of International Arbitration? and, if so, on what principle should it be organised?

SECTION B.—(MUNICIPAL LAW.)

Vice-Presidents.—H. H. Joy, Esq., Q.C.; Professor Molyneux. *Secretaries for Belfast Meeting.*—Adam Duffin, Jr., Esq., 9, College-square North, Belfast.—(For Strangers.) Hugh Hyndman, Esq., Waring-street, Belfast.—(For town.) J. Lowry Whittle, Esq., 47, Kildare-street, Dublin.—For officers and papers.) Samuel Bruce, Esq., Donegall-place, Belfast.

SPECIAL QUESTIONS FOR DISCUSSION.

1. On what points should the Laws and Procedure of England and Ireland be assimilated?

2. Is it desirable to establish a Court of Criminal Appeal on the facts? and, if so, on what plan?

3. How far is it desirable to further centralise or localise the Administration of Justice?

SECTION C.—(REPRESSION OF CRIME.)

President.—The Right Hon. the Master of the Rolls. *Secretaries for Belfast Meeting.*—John Coates, Esq., Wellington-park, Belfast.—(For town) Constantine Molloy, Esq., 62, Lower Gardiner-street, Dublin.—(For officers and papers.) Wakefield Pim, Esq., High-street, Belfast.—(For Strangers.)

SPECIAL QUESTIONS FOR DISCUSSION.

1. What better measures can be adopted for the Repression of Crimes of violence against the Person?

2. How can the Organization of our Police be improved with a view to the more effectual Repression of Crime?

The following are also suggested as suitable subjects for Voluntary Papers:—1. Public Prosecutor. 2. Law of Copyright. 3. Secondary Punishments. 4. The Working of the Industrial Schools Act.

EDUCATION.

President—Thomas Andrews, M.D., F.R.S. *Secretaries for Belfast Meeting.*—Rev. J. Lowry E. Berkeley, Lurgan.—(For officers and papers.) John Lanyon, Esq, The Abbey, Whiteabbey.—(For town.) John O'Hagan, Q.C., 10, Kildare-street, Dublin.—(For Strangers.) Rev. E. J. Hartrick, M.A., Belfast.

SPECIAL QUESTIONS FOR DISCUSSION.

1. Is the "National" or "Denominational" system of Education best suited to the circumstances of Ireland?

2. What are the best means for improving the *status* o

Teachers, and for securing for the public sufficient guarantees for the efficiency of their teaching?

3. What is the best method for educating the Idiotic and Imbecile? and ought the State to subsidise educational establishments for such persons?

The following are also suggested as suitable subjects for Voluntary Papers:—The Extension of the Factory Acts. 2. Technical instruction supplementary to Primary School Education. 3. Night Schools.

ECONOMY AND TRADE.

President.—Sir Robert Kane, F.R.S.

SECTION A.—(SOCIAL ECONOMY.)

Secretaries for Belfast Meeting.—George L. Leatham, Esq., North-street, Belfast.—(For town.) John Munroe, M.A., Lower Gardiner-street, Dublin.—(For officers and papers.) Professor Slattery, Trinity College, Dublin.—(For strangers.)

SPECIAL QUESTIONS FOR DISCUSSION.

1. What legislative or other measures can be adopted to improve the relations between Landlord and Tenant in Ireland?
2. What are the economic results of the continuous Emigration from Ireland?
3. Should the Local Government Acts be extended to Ireland?

SECTION B.—(TRADE.)

Chairman.—John Mulholland, J.P. *Secretaries for Belfast Meeting.*—W. H. Dodd, M.A., 3, Albion-street, Belfast.—(For officers and papers.) Gustavus Heyn, Esq., Strandtown, Belfast.—(For strangers.) Frank Lepper, Esq., Trainfield, Belfast.—(For town.)

SPECIAL QUESTIONS FOR DISCUSSION.

1. Can any measures be taken to develop and extend the Manufactures of Ireland?
2. What action, if any, ought the Government to take with regard to Railways?
3. How may the extension of the Irish Fisheries be best promoted?

REGULATIONS CONCERNING PAPERS AND DISCUSSIONS.

The special questions, stated in the former part of this programme, have been drawn up by the commitees of the Departments, and will occupy each department during three days of the meeting.

No department or section will take up more than one such question on any day.

The Committees will obtain reports or papers to open the discussions of these questions, but any member or associate may contribute papers on them, subject to the following conditions:—

(*a.*) The paper must not occupy more than twenty minutes in reading.

(*b.*) Not more than one-half of the day will, under any circumstances, be given up to the reading of papers; the choice of papers for reading rests solely with the committee of the department, though the papers not read may be published in the *transactions* if the council think fit.

The report of the council to the association will embody information and suggestions sent to the general secretary by individual members.

No paper already published can be read.

No paper, when read, can be published by the author (unless by permission of the council) previous to the publication of the *transactions* of the Association for 1867.

The council may print any paper, either in whole or in part, or may exclude it from the *transactions*, as they see fit.

Each paper must be sent to the general secretary, on or before the 1st of September. On the first page of every paper should be written the question or subject, the name of the author, and his address.

REGULATIONS CONCERNING MEMBERS AND ASSOCIATES.

The members of the Association are of two classes—ordinary members and London members.

Ordinary Members.—Those who desire to serve on committees, or to take an active part in the proceedings of the Association, or who desire to have a copy of the volume of the *transactions* for the year, join as ordinary members, at a subscription of one guinea.

London Members.—Those who desire to have the additional privilege of attending the meetings held in London, during the winter, of departments of the association; to receive the publications connected therewith, and to have the use of the library of the association in London; pay a subscription of two guineas.

Transferable Ladies' Tickets.—Ladies may obtain transferable tickets for the meeting at Belfast for fifteen shillings.

Associates.—Gentlemen and Ladies may obtain associates' tickets (not transferable) for the meeting at Belfast for ten shillings.

Corporate Members.—Any public body, such as a chamber of commerce, mechanics' institute, working men's college, &c., may become a corporate member by paying an annual subscription of two guineas. Such bodies will get the volume of *Transactions*, and may nominate three representatives for the meeting, who will get associates' tickets.

Correspondence.

MEDICAL CORPORATE REFORM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—You have spoken out about the grievances incidental to the College of Physicians, so far as its Fellowship is involved. But there are other matters that, now you have opened the great question of medical corporate reform, equally deserves your attention. I beg you to give them all as full and fair a consideration. Have you nothing to say about the Licentiates of that body? They are spreading over the country, and dubbing themselves doctor with an effrontery equal to the Edinburgh licentiates, and unless something be done the whole College will soon be dragged through the mire just as it was in irritating the north in the year of grace, "so called" you justly add. You admit some would demur to the title. I call it the year of disgrace.

A FELLOW.

ELECTION TO THE FELLOWSHIP OF THE ROYAL COLLEGE OF PHYSICIANS, LONDON.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your remarks on the process of election to the Fellowship of the Royal College of Physicians will find an echo throughout the kingdom. Now that the sister College in Lincoln's Inn Fields has begun to act, it is time the old club in Pall-Mall should be invaded by the same spirit. The recent granting of licences to practise, in the hope of eclipsing the other bodies, is neither more nor less than raising the wind at the expense of the status of the old licentiates and modern members. These latter pay thirty guineas for the privilege of belonging to a college of physicians which is rapidly deteriorating into a college of general practitioners. The few who obtain the Fellowship are the personal friends of the self-elected Council. Abler men, more modest men, more laborious men, languish among the members, and sigh as each year's batch reminds them that they are growing old unrecognised. Any one could point out the names by the dozen of those who deserve well of their profession. Why are they not rewarded by the Pall-Mall College?

Go on, sir, with the battle you have begun. Men in high office in the College have admitted to me the justness of your remarks. Already your contemporaries have taken up the subject. You started it. Persevere until the monopolists are shamed into justice.—I am, sir, your obedient servant,

M. D.

IRISH MEDICAL OFFICERS' WIDOWS' ANNUITY SOCIETY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I feel extremely obliged for your letter, received this morning, enclosing the printed rules of the Irish Constabulary Officers' Widows' Annuity Society. The observations I made in the MEDICAL PRESS AND CIRCULAR of the 17th instant, relative to your two recent letters published in that excellent Journal, are only in keeping with your merits. You have been long labouring hard in the cause of the widows and orphans of medical men. Your cause is a righteous and holy

one, and well deserving of support from every member of the medical profession. All that surprises me is that the medical profession do not gladly avail themselves of the sound and wise proposals you have made for the welfare of their widows and orphans, and that they seem so dead to their own interests. The members of the medical profession are proverbial for their charity and benevolence to others—Why is it that they are found wanting when the interests of their own households are concerned? In the time of distress, will they trust to the scanty pittance which the Irish Medical Benevolent Fund Society is enabled to give to its numerous claimants, when a certainty may be realised for their widows and orphans by a small annual subscription to a society specially formed for this purpose. In the first instance, the small pittance is urgently sought and given as a charity; in the second, the assistance is demanded as a right. How much more independent then would the profession be if your views were fully carried out. How much happier would each medical officer of a dispensary or workhouse feel himself, if it should be the will of God to take him away before he had made a provision for his family—and how many have been called away prematurely without having made such provision, you know too well—to know that there is some provision made for his wife and children under such afflicting circumstances. Why, the knowledge of such a fact alone will prevent him from sinking prematurely into his grave, it will be a comfort to him under all his difficulties, and will sweeten the labour he is constantly undergoing. The plan you have laid down so clearly for the working of the Irish Medical Officers' Widows' Annuity Society is so well defined and simple in all its arrangements that I have not a single improvement to suggest. If the Society were once established by Government, and aided by the Poor-law Commissioners, it would flourish, and would prove an immense blessing to the profession. How such a glorious consummation is to be effected is the difficulty. But God will not forsake those that trust in Him, and try to help themselves—the united action of the profession would prove irresistible if brought properly into play with the Poor-law Commissioners and the Government. It is on this account that I consider that the Irish Medical Association, which is the proper representative of the profession, ought to take upon itself the responsibility of this holy cause.

I have no objection to agree to any means which may be suggested for the furtherance of this great, this grand, this momentous undertaking, provided the end is attained in all its integrity, and I perfectly agree with you that the time appears ripe for the movement, and everything which ought to be done should be done quickly.—I remain, yours most truly,

M. F. BERNARD.

THE CASE OF DEASE *v.* WHISTLER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—A few comments *apropos* of the Dease *v.* Whistler case, and others of that kind, may not be amiss. And first, I would observe that this case goes to show that the so-called censures of Dispensary Committees are not things to be greatly dreaded, and that they may in the result turn out to be censures, *not* of the Medical Officer, but of the Committee themselves; for is not this whole case a strong censure of the Bray Committtee, and of that pragmatical gentleman, the plaintiff, especially?

I will further observe, in reference to a statement I read in the *Daily Express* of the 18th inst., and a similar case recorded in the *Ballyshannon Herald* of last Saturday, that if Medical Officers only knew their rights, and would assert them, neither Committees nor Boards could refuse to maintain a substitute under the circumstances in which these two gentlemen (Drs. Whistler and Welsh) have been placed. Read and study the 22nd article of the Commissioners' "General Rules," and you will see that when the Medical Officer is incapacitated by illness from doing his duty, the Committee is to meet to appoint a substitute, and the Board is to determine the amount of payment. This plainly implies that said Board is to pay the substitute.

I would further enjoin on my brethren that they be not afraid to assert their rights; let them not be afraid even of investigations when they have a good cause.

I have tried these things, and will be happy to communicate the result of my experience to any honest man (of whom I believe there are many) among my brethren. But as to those who think by tame submission, or servile flattery, to conciliate favour—they will be disappointed, and justly too. The more they yield up their just rights and self-respect, the greater burthens will be imposed on them. "If the Romans are sheep, Cæsar will be a wolf." Let us show a just appreciation and assertion of our own position, and of the valuable services we unquestionably render to society, and we shall be better treated. Do we not expose our lives in attending contagious diseases for salaries for which the meanest and most ignorant members of our committees would be unwilling to undergo the same risk? Do we not stand between the community on the one hand, and disease and death on the other, as far as such service can be rendered by human means?

Again, I say let all who are circumstanced as above carefully consult the Commissioners' General Order.

I am happy to be able, in conclusion, to bear my humble testimony in confidence that the Commissioners will generally arbitrate reasonably and, I believe, justly.—I am, sir, yours, &c.,

"DISPENSARIUS."

SEA-SICKNESS AND THE BRITISH MEDICAL ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—You have recently called the attention of your readers to my discovery of a remedy for sea-sickness. It occurs to me that as you invited the Profession to test its reality, an excellent opportunity of doing so is about to occur: English members of the British Medical Association, about to meet in Dublin, will have to cross the Irish Channel; and, of course, the English Channel must be crossed by all who proceed from the United Kingdom to the Medical Congress at Paris. Now, in order to induce medical gentlemen to assure themselves of the reality of my discovery, that sea-sickness may be prevented or cured by means of the spinal ice-bags, I beg to say that I shall be happy to lend a spinal ice-bag to each of those medical men who may be willing to use it, and to report the result of the experiment. Moreover, I have arranged with Mr. Simpson, of 315c, Oxford-street, the proprietor of Ash's Patent Filtering Refrigerator, and Piston Freezing Machines, to supply gratis, packed for transit, the amount of ice necessary for each bag.—Yours truly,

JOHN CHAPMAN.

Somerset-street, London, W.

Gleanings.

MEDICAL ORTHODOXY AND HERESY IN THE OLDEN TIME.—It was not always thus. The inimitable plays of Molière, the essays of Montaigne, the marvellous satires of Rabelais, contain many traces of a period when the strife between orthodoxy and heresy was as fierce and as full of bigotries on both sides in medicine as it ever was in the still greater controversies of religion. The letters of Gui Patin, Dean of the Faculty of Medicine of Paris in the middle of the seventeenth century, have stereotyped for us and for all time, with the most charming frankness and simplicity, a state of opinion in which the circulation of the blood was still an almost forbidden faith more than thirty years after the facts were made clearly known by Harvey—a time in which all manner of chemical remedies were prescribed by a dominant opinion, as being unknown to Galen and Hippocrates—in which bleeding and purging figured as the authorised remedies for nearly all diseases and all stages of them—in which antimony and Peruvian bark were denounced with equal bitterness—the one as savouring of the "chemists," the other as the "powder of the Jesuits"—in which tea was an "impertinent novelty of the age," and opium nothing better than a poison—in which, in short, the established orthodoxies of that particular era had to be maintained out and out, and were in fact maintained out and out, both as against old and new opinions—against Arabian traditions and modern innovations—with equal pertinacity; and, no doubt, in many instances, as in that of our charming and garrulous Gui Patin, with equal good faith.

There was scarcely anything a-wanting in the midst of these acrimonious controversies to complete and to justify the satirical picture of Thomas Diafoirus in the pages of Molière: a simpleton by nature, turned by art into a physician; drilled and tortured through a course of formal logic and pedantic learning into a regular round of fixed opinions; his mind "well broken in and laced up in Spanish boots," as Gœthe has it, to the utter destruction, not only of all originality, but of all desire for originality. "We had all the trouble in the world (such is the picture) to teach him to read; he was nine years old before he knew his A B C. . . . . When I sent

him to college he was much distressed at first, but he hardened himself against all difficulties, and his regents always praised him to me for his assiduity and for his work. At last, after many strokes of the hammer on the iron, he has gloriously attained his diploma; and I can say, without vanity, that for the two years during which he has been upon our benches no candidate has made more noise than he in all the disputations of our school. He has become formidable, in fact; there is not an act (*i e.*, a public disputation) that he does not argue tooth and nail, right or wrong, for the contrary proposition. He is firm in disputing, strong as a Turk on his principles, never gives in an inch of his opinion, and pursues a verbal argument into the very uttermost recesses of logic. But, above everything, that which pleases me in him, and in which he follows my example, is that he attaches himself blindly to the opinions of our forefathers, and that he has never chosen either to comprehend or to listen to the reasons and the experiments of those pretended discoveries of our age touching the circulation of blood, and other opinions of the same kidney."*

The old Faculty of Medicine fell, having done its work both of good and of evil; it could not survive in an era of experimental physiology; the circulation of the blood was too much in the end for all the learning and all the orthodoxies of that most learned and most orthodox age. Still, we must not be unjust. The Faculty was not always obstinate, nor always in the wrong; and even our honest Gui Patin, though prejudiced and bitter against what he thought to be quackery and causeless innovation, was by no means a Thomas Diafoirus. On the contrary, one sees in his letters everywhere the spirit of a true-hearted and genial physician, fettered, it is true, by traditional and authoritative opinions, but protesting with all his might against complicated and quackish remedies, bezoards, theriac, mithridate, as well as against all "occult qualities," alchemy, astrology, talismans, charms, and other manifest impostures. Nor can there be a doubt that his resistance to the progress of antimony and Peruvian bark were the testimony of a thoroughly honest and upright man against many and gross abuses in practice, upheld in the end by the sympathy of the court, and, strange to say, by the support of that same Faculty, with whose authority he had so often fortified his denunciations of Guénaut and the antimonialists.

The history of this last dispute is curious, and may be here condensed into a very few sentences. In 1566, the Faculty of Medicine had taken solemn action in the case of antimony, which the extravagant praises of Paracelsus and the chemists had brought into a kind of popular repute. Their decree was apparently unanimous, and was to the effect that "by the authority of all who have been distinguished in medicine, and for reasons already submitted to the king, *antimony is deleterious, and to be counted among the simples which possess the quality of poisons. Nor can it be amended by any other preparation, so as to be taken without injury.*"† In 1615, another decree placed several chemical drugs, antimony included, under formal condemnation of the Faculty, which, "by the unanimous consent of all," interdicted drug-vendors and all others from uttering these drugs; and "calls upon all judges to deal severely with those who prescribe, administer, or exhibit for sale the said medicines "‡ Both of these Acts were ratified by the Parliament of Paris, and both of them continued nominally in force till 1666, exactly a century after the passing of the first. But, in the meantime, antimony was gaining ground, quickened, no doubt, into a kind of popular fictitious reputation by the opposition of the doctors, till at last both Cardinal Mazarin and the King had been submitted to treatment by it at the hands of Guénaut, and after a controversy altogether unexampled in its fierceness and extravagance upon both sides, the balance in the Faculty itself began to incline in favour of antimony. Even so late as 1651, however, Guénaut, Beda, and Cornuti were formally condemned by the Faculty for being led away by antimony, "*spe lucri*," writes Patin confidentially; and this sentence, he adds in high jubilee of triumph, "has made them return to their duty, and if hereafter they fail in it, we will not fail them; we will apply the law and the power of the decree so keenly that they will remain expelled by it. . . . If we had suffered these three there, they would no doubt have attracted others, by the rule *Abyssus Abyssum invocat.*"* But, alas! for big words and high-handed judgments! In 1666, when Patin was no longer Dean, having been replaced by Le Vignon, the Faculty of Medicine of Paris again met on the 29th March, and "in an assembly of one hundred and two, decided by the vote and suffrage of ninety-two doctors, that *antimony is to be numbered among purging medicines, and that it shall be in the power of every doctor to prescribe it*, on fitting occasions, and to write and dispute publicly about it, provided always that these things are done for the general good." This decree was also confirmed, like the former ones, by an edict of the Parliament of Paris; which, however, added a prohibition to all persons against the use of this medicine without the advice of the Faculty.†

One may imagine the disgust of Gui Patin at being thus foiled with his own weapons, and seeing his beloved Faculty invaded in force by the "*troupe stibiale et stigiale*,"‡ as he calls them in his somewhat savage irony. "I console myself," he writes, "because there must be heresies, in order that the good may be tried; but I have never been of the humour to adore the golden calf, nor to consider fortune as a goddess. . . . When the wind shall have changed, all these champions of antimony will be dispersed like the smoke of their furnace." And so he withdraws quietly from the controversy. We hear little more either of Patin or of the much-abused Guénaut thereafter in the Faculty of Paris. Guénaut, indeed, died the next year of an apoplexy, as we learn in a brief paragraph of a letter under date 17th May, 1667. It is curious that not a trace remains of the personal history, or of the professional labours of this great disturber of orthodoxy in the seventeenth century. Boileau mentions him twice, in neither place in a complimentary manner. He is supposed to have furnished forth the dramatic portrait of M. Macroton, by Molière, in the Amour Medecin. It may be, perhaps, fairly presumed that the reproaches of the old Dean of Faculty were not altogether undeserved, and that this arch-antimonialist was one of those nimble and shifty persons who study much more effectually the art of putting money in the purse, than of adding to the real knowledge and resources of the art of medicine.—*Dr. Gairdner's Introductory Address.*

SPECTRES.—The whole family of the Phasmidæ, or spectres, is more or less imitative, and a great number of the species are called "walking-stick insects," from their singular resemblance to twigs and branches. Some of these are a foot long and as thick as one's finger, and their whole colouring, form, rugosity, and the arrangement of the head, legs, and antennæ are such as to render them absolutely identical in appearance with dead sticks. They hang loosely about shrubs in the forest, and have the extraordinary habit of stretching out their legs unsymmetrically, so as to render the deception more complete. One of these creatures obtained by Mr. Wallace in Borneo (Ceroxylus laceratus) was covered over with foliaceous excrescences of a clear olive green colour, so as exactly to resemble a stick grown over by a creeping moss or jungermannia. The Dyak who brought it assured him it was grown over with moss although alive, and it was only after a most minute examination that he could convince himself it was not so.—*Westminster Review.*

PARIS STATISTICAL SOCIETY.—This learned body intends having six public *seances* (August 19th to 24th), and any foreign *savants* wishing to be present are requested to put themselves in communication with M. Golzard, the agent of the Society, 92, Rue Richelieu, who will forward them programmes of the questions to be discussed, and will receive from them any papers they may wish to have read pertaining to such questions. The programme embraces the population question, emigration, illegitimate and still-births, division of property, credit establishments, primary instruction, and public assistance.—*Medical Times and Gazette.*

No alterations have been made in the Vaccination Bill although it has been referred to a select committee of the House of Lords. It will be for the profession now, whatever faults it may have to find with the Bill, to accept it, and to work it thoroughly. If the measure is found not to work well, or to impose too much work for too little pay on the profession, we shall make complaint all the more effectually after a hearty trial of the Bill.—*Lancet.*

* Le Malade Imaginaire, Act 2, Sc. 6.

† Facultatis de Antimonio Censura. Decretum in Scholis Medicinæ, tertio Calend. August, anno 1566.

‡ This, with the preceding, I have taken from a foot-note in the edition of Gui Patin edited by Reveillé-Parise, vol. i., p. 191. The Latin text is, however, extremely ill printed, and barely intelligible as there given.

* Op. Cit., vol. ii., p. 387.

† Patin's letters, *ut supra*, vol. iii. p. 609, gives the decree of the Parliament; that of the Faculty I have found in Raynaud, "Les Medecins au temps de Molière. 1862," p. 212.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted members of the College at a meeting of the Court of Examiners on the 23rd inst. :—

Messrs. Henry Culliford Hopkins, Martock, Somerset; Humphrey Lloyd Williams, Bala, Merionethshire; Nathaniel Howard Jarvis, Kingsbridge, Devon; Haswell Delabere Shelton, Bromyard, Herefordshire; and John Griffith Lock, M.A., Cantab., Tenby, South Wales, students of St. Bartholomew's Hospital; William Charles Gasteen, M.B. Trin. Coll. Dub., Dublin; William Isaac Williams Aoergele, North Wales; Henry George Hall, Dublin; and Richard Arthur Pritchard, Pwllheli, North Wales, of the Dublin School; William Alfred Hunt, Yeovil, Somerset; and Samuel Freeman Bagnall, L.R.C.P. Lond., Bedford-square, of King's College; Thomas Fawsitt, Oldham; and William Hodgson Carruthers, Halton, Cheshire, of the Manchester School: Joseph Chaning Pearce, Bristol; and Thomas Dudley Saunders, Bath, of the Bristol School; Charles Newton Bell, Rochester; and Alexander Cummings Air, Walworth, of St. Thomas's Hospital; Charles Sangster, L.S.A., Lambeth-terrace, of Guy's Hospital; Charles Henry Lister, Doncaster, of University College; Robert Alcock, Burslem, Staffordshire, of the Charing-cross Hospital; Frederick Churchill, M.B. and C.M. Edin., Penge, Surrey, of the Edinburgh School; Edmund Cuthbert Ring, Foxley-road, Kensington, of St. George's Hospital; and William Edward Green, Droitwich, of the Birmingham School.

At this meeting of the Court of Examiners, Professors Samuel Solly and Sir William Fergusson, the recently elected members of the Board, took the chairs rendered vacant by the resignations of the late Sir William Lawrence and Mr. Francis Kiernan respectively. And on the 24th inst. :—

Messrs. Oswald Henry Foster, M.A. Cantab., Hitchin, Herts; Augustus Wells, Sydney, New South Wales; Frederick Aubrey Thomas, L.R.C.S. and L.R.C.P. Edinburgh, Devonport; and William Henry Rawlings, Liskeard, Cornwall, students of Guy's Hospital; Charles Dennis Hill Drury, Newcastle; George William Geldart, North Shields; Edward Rray Pellew, Gateshead; and George Bolton, Sunderland, of the Newcastle School; James Peter Bryne, Glenealy, county Wicklow; and Thomas Castley Bailey, Penrith, of the Dublin School; Joseph Moore, Manchester; and Edward Reginald Johnson, Jersey, of St. Bartholomew's Hospital; Charles Ogden, Rochdale, of the Liverpool School; Francis Raworth Heycock, Pytchley, Northamptonshire, of the Edinburgh School; Louis Marc Le Grand de la Liraye, L.R.C.P. London, Paris, of University College; Henry Walmsley, Preston, Lancashire, of St. Thomas's Hospital; John Thomas Hughes, M.B. Aberdeen, Llanrwst, North Wales, of the Aberdeen School; Robert Lewis Willcox, L.S.A., Wareham, Dorset, of King's College; and Thomas Standish, Dudley, of the Birmingham School.

And on the 25th inst. :—

Messrs. Lewis Evan Evans, Granville-square, Edward Henry M'Clean, Barbadoes; and Edgar George Pottle, City-road, students of St. Bartholomew's Hospital; Atmaram Sadashiva Jayakar, L.R.C.P. Lond., Bombay; Joseph Gerson Da Cunha, Goa; and Antonio Simplicio Gomes, Hongkong, of the Bombay School; Walter Herbert Mills, Cape Town, George Thomas May, Burslem, Staffordshire, and George Mannings, Downton, near Salisbury, of King's College; Frederick Henry Blenkinsop, Bedford; and Thomas Henry Lovegrove, Nottingham, of St. George's Hospital; John Strelley Carslake Yule, Bury, Lancashire, and William Richard Davies, M.B. Lond., Carmarthen, of University College; James Dunne, Dunshaughlin, County Meath, and Henry Worsley, Golborne, Lancashire, of the Dublin School; Frederick Wallace, L.S.A., Hackney-road, of Guy's Hospital; Laurence Saunders, M.D., Kingston, Canada; Charles Richardson, Leeds, of the Leeds School; John Waterhouse Daniel, M.D., Bellevue, New York, Nova Scotia, of the London Hospital; John Stride, King William-street, E.C., of St. Thomas's Hospital; William Edward Baylie, Poole, Dorset, of the Charing-cross Hospital; Donald William Robertson, Thornton, Yorkshire, of the Edinburgh School; and Kenrick Morton Lloyd, Holywell, Flintshire, of St. Mary's Hospital.

It is stated that only nine out of the seventy-four candidates who presented themselves for examination during the past three days, failed to acquit themselves to the satisfaction of the Court of Examiners, and were, consequently, referred to their hospital studies for the full period of six months. The examinations for the present session at the College of Surgeons, are now closed, with the exception of one meeting on the 1st proximo, for the licence in midwifery.

UNIVERSITY OF LONDON.—The following are lists of Candidates who passed the respective Examinations indicated :—

PRELIMINARY SCIENTIFIC M.B. EXAMINATION.

First Division.—Edward Bibbins Aveling, private study; James Barry Ball, University College Hospital; Frederick Settle Barff (student before '39), chemistry and botany only, University College; John Mitchell Bruce, M.A.Aberd., University of Aberdeen; William Barnett Burn, St. Bartholomew's Hospital; Charles Henry Carter, University College; Ernest Alfred Elkington, Sydenham College, Birmingham; Alfred Thomas Gibbings, King's College; James Alfred Harris, University of Edinburgh; Michael Harris, Guy's Hospital; Horace Eyre Haynes, St. Bartholomew's Hospital; Thomas Henry Hunt, Manchester Royal School of Medicine; Arthur Richard Saunders, University College; Alfred John Wall, St. Mary's Hospital.

Second Division.—Philip Henry Bindley, Sydenham College, Birmingham, William Frederick Richardson Burgess, Guy's Hospital; William Ward Carr, University College; Alfred Henry Carter, University College; Alfred Cotterill, King's College; Sidney Coupland, University College; Francis Richardson Cross, King's College; Henry Eugene DeMeric, King's College; John Ellis Edwards, Guy's Hospital; Thomas Colcott Fox, University College; George Cooper Franklin, St. Thomas's Hospital; John Cameron Graham, University College; George Ernest Herman, London Hospital; Joseph Theodore Ingoldby, Guy's Hospital; Thomas Jones, Guy's Hospital; Walter George Lowe, St Bartholomew's Hospital; Robert Wishart Lyell, King's College; Henry Davis Male, St. Thomas's Hospital; William Smith Paget, Liverpool School of Medicine; Charles Edward Steele Perkins, Guy's Hospital; Walter Pippette, Westminster Hospital; Rhinallt Navalw ap Joan Pughe, private study; Alexander Antonio Ralli, St. Bartholomew's Hospital; John Alexander Rayner, King's College; George Le Hunt Rowland, King's College; Baron Alfred Rugg, University College; Maximilian Frank Simon, St. Thomas's Hospital; Samuel George Sloman, St. Bartholomew's Hospital; Arthur William Smith, Guy's Hospital; Henry Edward Southee, private tuition; William Whitchurch Taunton, University College; Henry Edward Waddy, Guy's Hospital; William Henry Willans, University College; William Williams, Guy's Hospital.

FIRST B SC. EXAMINATION.

First Division.—James Bottomley, B.A., Owens College; Francis James Carey, M.A., Guy's Hospital; William Gunn, private study; Percy John Harding, University College; John Hopkinson, Owens College; Arthur Robinson, Owens College; William Augustus Tilden, private study; Richard Wormell, M.A., University College.

Second Division.—James Barry Ball, University College; Seward William Brice, B.A., Royal School of Mines; John Albert Bright, University College; John Cameron Graham, University College; Rev Frederick Leonard, M.A., LL.B., Baptist Bristol, and University; Henry Mander Pearsall, B.A., New and University Colleges; Charles Sheldon, B.A., Owens College; William Thorp, Royal School of Mines; George Mathews Whipple, private tuition.

HOSPITAL SHIP HAMADRYAD.—The first report from the committee of this hospital has appeared. The *Hamadryad* was obtained from the Goverment for the reception of sick seamen arriving at the port of Cardiff. She can accommodate 50 patients, and was formally opened in the beginning of November. During the six months ending the 30th of April last, 254 in, and 290 out-patients were treated. The report says that 11 per cent. of all medical cases entered were suffering from scurvy.

HONORARY DEGREES.—We are enabled to supplement the information contained in another part of our issue on this matter. The King and Queen's College of Physicians in Ireland have decided on granting eight Honorary Fellowships in connection with the meeting of the British Medical Association in Dublin. We believe we are correct in stating that the following gentlemen will be recipients of the honour: Dr. J. Hughes Bennett, of Edinburgh; Dr. A. P. Stewart, of London, Secretary of the Metropolitan Branch of the Association, and late Professor of Practical Medicine in the Middlesex Hospital; Dr. G. T. Greame, Physician Accoucheur to the Princess of Wales; Mr. Lockhart Clarke, F.R.S., the celebrated Microscopist and Physiological Anatomist; Dr. Markham, Physician to St. Mary's Hospital, and formerly Editor of the *Association Journal*; Dr. Waters, of Chester, the outgoing President, and Dr. Falconer, of Bath, Treasurer of the Association, and President of the Local Branch. The recipient of the eighth Fellowship has not yet been decided.

NOTICES TO CORRESPONDENTS.

All Contributions are attentively considered, and unaccepted MSS. are returned on receipt of stamps for postage; but the Editors cannot be responsible for any accidental loss, nor can MSS. or replies be delivered on personal application.

Contributions should be *legibly* written, and only on one side of the paper.

When proofs are forwarded it is of the utmost importance that they should be corrected and returned without delay.

M. Firth.—We hope to find room for your communication in our next.

Dr. Letheby is thanked for his valuable paper. Proofs will be sent him as requested.

Dr. Macallister's paper on the Physiology of the Gall Bladder, has been received, which we hope to be able to publish in a week or two.

Dr. C.—Your request has been attended to.

A Unique Case, by *W. H. Sandham*, shall appear as soon as possible.

Dr. J.—The evidence forwarded is too long for publication, although its importance to the profession and the public at large is readily admitted. We can only find room for a few extracts.

F. M.—We are unable to trace anything in your paper to warrant its publication.

Dr. P. J. is thanked; we cannot, however, find space at present to reopen so useless a discussion.

Dr. K.—Wouldn't you like it! Sorry to disappoint you.

We have also been favoured with several other valuable contributions, letters, reports, &c., which shall appear as soon as space permits.

MEDICAL APPOINTMENTS.

ENGLISH.

DUDLEY, J. D., M.D., has been appointed Assistant-Physician to the Metropolitan Free Hospital, Devonshire-square, vice E. Head, M.B., resigned.

Duke, R., F.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for districts Nos. 1 and 2 and the Workhouse of the Battle Union, Sussex, vice H. M. Champneys, F.R.C.S.E., resigned.

Evans, T., L.R.C.P.Ed., has been appointed Medical Officer and Public Vaccinator for the Britonferry District of the Neath Union, Glamorganshire.

Hill, J. H., L.R.C.P.Ed., has been appointed House-Surgeon to the Royal Free Hospital, Gray's-inn-road.

Longheed, J. W., L.R.C.S.I., Assist.-Surgeon 56th Foot, has been appointed Staff Assist.-Surgeon, vice Stafford, who has exchanged.

Preston, A. F., M.B., Surgeon 27th Foot, has been appointed Assist.-Surgeon Royal Artillery, vice Bouchier, placed upon half-pay.

Scott, J. E., M.D., Surgeon Rifle Brigade, having completed twenty years' full-pay service, has been promoted to Surgeon-Major under the provisions of the Royal Warrant of April 1st, 1867.

Stafford, P. W., L.K.Q.C.P.I., Staff Assist.-Surgeon Army, has been appointed Assist.-Surgeon 56th Foot, vice Longheed, who has exchanged.

Lewis, J., M.D., has been appointed Medical Officer and Public Vaccinator for the Glyncorrwg (a new) District of the Neath Union, Glamorganshire.

Russell, F. M., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Eastern District of the Neath Union, vice H. L. Prichard, M.R.C.S.E., resigned.

Williams, Dr. Chas. T., has been appointed Assistant-Physician to the Hospital for Consumption and Diseases of the Chest at Brompton.

IRISH.

Anster, W. B., L.K.Q.C.P.I., has been elected Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Kennitty Dispensary District of the Parsonstown Union, King's County, vice H. L. Smith, L.K.Q.C.P.I., resigned.

Atkin, J. M., M.D., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births &c., for the Tartaraghan Dispensary District of the Lurgan Union, Co. Armagh, vice G. G. A. Sutcliffe, M.R.C.S.E., resigned.

Davy, H., M.B., has been appointed Medical Officer for the Northern Division of Rathfarnham and Whitechurch Dispensary District of the South Dublin Union, vice R. P. White, L.K.Q.C.P.I., resigned.

SCOTCH.

Benny, M., M.D., has been appointed Medical Officer and Public Vaccinator for the Parish of Denny, Sutherlandshire, vice James Cuthil, M.D., resigned.

Kidd, W. J. P., M.D., has been appointed Medical Officer and Public Vaccinator for the Parish of Ballantrae, Ayrshire, vice J. F. M'Gill, L.F.P. & S.Glas., resigned.

Births, Marriages, and Deaths.

BIRTHS.

Christophers.—On the 12th inst., at Skisdon Lodge, St. Kew, Cornwall, the wife of J. C. Christophers, F.R.C.S.E., of a son.

Brown.—On the 12th inst., at Uppingham, Rutland, the wife of Frederick Warren Brown, M.R.C.S.E., of a son.

Macdonald.—On the 17th inst., at Haslar, the wife of Dr. J. D. Macdonald, Staff Surgeon, R.N., of a daughter.

Horn.—On the 18th inst., at Dalton in Furness, the wife of William Horn, Surgeon, of a daughter.

Wigmore.—On the 18th inst., at Inverness-road, Bayswater, the wife of Wm. Wigmore, M.R.C.S.E., of a son.

Tanner.—On the 19th inst., at Gloucester House, Ledbury, the wife of Robert Tanner, M.D., of a daughter.

Crocker.—On the 17th inst., at Belfast, the wife of Surgeon-Major Crocker, the Buffs, of a daughter.

Dickson.—On the 21st inst., at No. 1, The Square, Buxton, the wife of Dr. F. K. Dickson, of a son.

Propert.—On the 22nd inst., at 100, Gloucester-place, Portman-square, the wife of J. L. Propert, Esq., M.B., of a son.

Turner—On the 20th inst., at Woodside, Upper Norwood, the wife of J. Sidney Turner, M.R.C.S., of a daughter.

MARRIAGE.

Niven—Webster.—On the 25th inst., at the house of the bride's father, by the Rev. John Thomson, F.C., the Rev. W. Niven, Innerleithen, to Jane Anne, only daughter of A. Webster, Esq., L.F.P.S.G., Kirriemuir.

DEATHS.

Ward.—On the 21st ult., suddenly, J. Ward, M.R.C.S.E., of Epsom.

Stillwell.—On the 22nd ult., G. J. Stillwell, M.D., of Park-street, Grosvenor-square, and Moorcroft, Hillingdon, Middlesex.

Tutin.—On the 17th inst., J. H. Tutin, M.R.C.S.E., of Ripon, Coroner for the Liberty of Ripon, aged 36.

Newham.—On the 22nd inst., Samuel Newham, M.R.C.S.E., of Bury St. Edmunds, aged 47.

Bryant.—On the 1st inst., John Bryant, M.D., at his residence, Collebrooke-villa, Finchley, formerly of the Edgeware-road, in his 80th year.

Davies.—On the 18th inst., Mary Maria Davies, widow of the late Thomas Davies, M.D., of New Broad-street, City, at 18, Lorraine-place, Holloway, in her 4th year.

&c., &c., &c.

THIS COLLEGE is conducted on the MODEL of the GREAT PUBLIC SCHOOLS.

THE SONS OF GENTLEMEN are educated at a Moderate Cost, and THE PUPILS ARE PREPARED for OXFORD or CAMBRIDGE, and for all Military and Civil Service Examinations.

There are SCHOLARSHIPS OF CONSIDERABLE VALUE attached to the College, to be held either in the College or at the Universities.

The Pupils, if not resident in Malvern, are boarded with the ASSISTANT MASTERS, subject to the approval of the Head Master.

Terms for Tuition, £25 per Annum to Proprietors; and £31 per Annum to Non-Proprietors. For Board at Masters' Houses, £60.

Full information on application to Henry Aldrich, Esq., the Secretary.

MALVERN COLLEGE.

THE NEXT TERM commences on WEDNESDAY, the 18th September, 1867.

UNIVERSITY COLLEGE MEDICAL DINNER.

THE ANNUAL DINNER will be held, by the permission of the Council, in the Library of University College, on Tuesday, October the 1st. Dr. William Carr, of Blackheath in the Chair.

J. RUSSELL REYNOLDS, M.D. } *Hon. Secs.*
EMANUEL BAKER. }

LONDON NURSES' INSTITUTE,
42, South Audley-street, Grosvenor-square, W.

TRAINED NURSES (Medical, Surgical, Mental, and Monthly), can at all times be obtained from this Institute.

Hospital Appointments by special arrangement.

Letters and Telegrams should convey the nature of the case to be attended.

Apply to the Manager or Matron. T. HAMILTON, Manager.

LIFE ASSURANCE.—The Accumulated and Invested Funds of the STANDARD LIFE ASSURANCE COMPANY, and its Annual Revenue now amount to—

Accumulated Fund	... ...	**£3,700,000.**
Annual Revenue	... ...	**675,000.**

The Profits of the Company have been divided on seven occasions since 1825, when the Company was established, and on each occasion large and important benefits have been given to the Assured.

A new Prospectus just issued contains very full information as to the Company's principles and practice, and will be forwarded by post on application.

Agencies in every Town of importance throughout the Kingdom.

Agencies in India and the Colonies, where Premiums can be received and claims settled.

Lecture.

CLINICAL LECTURE ON NERVE DISORDER PROVING FATAL, UNATTENDED WITH DEMONSTRABLE LOCAL CHANGE.

By C. HANDFIELD JONES, M.B. Cantab., F.R.S.
PHYSICIAN TO ST. MARY'S HOSPITAL.

GENTLEMEN,—At our last meeting I told you that I should ask your attention shortly to the difficulty which is not unfrequently met with of determining the cause of various grave symptoms of central nervous affection. The inquiry in each instance is of the greatest importance, for on the conclusion we adopt our prognosis and treatment necessarily depend. The causative conditions we have to do with may be grouped in three sets:—1. Cases where, after death, some evident lesion is found, as a tumour, an embolon, a patch of syphilitic deposit, a limited focus of hæmorrhage, a softening from atheromatous disease of the vessels. 2. Cases where renal degeneration exists and consequent uræmia, or where the blood is contaminated by the gouty or any other tangible materies morbi. 3. Cases where the nerve power has been depressed by a shock, as that of an operation on the urethra, or by some imponderable miasm like that of epidemic catarrh, and where, after death, no organic alteration can be discovered. To this group belong also the instances of reflex, or inhibitory paralysis, dependent on remote irritation.

With regard to the first group, *time* is the most important element in the diagnosis, or rather may be, for, of course, if the case is recent we are deprived of all aid from this source. If a palsy has occurred some weeks or months ago, and persists, amending slowly and uncertainly, or, *a fortiori*, if it deteriorate in spite of all means employed, little doubt can exist that it depends on some demonstrable organic lesion. On the other hand speedy disappearance does not amount to a proof of the absence of such lesion, but it can hardly have been extensive. *Age* is another consideration which may be of much weight, a palsy in an old person is, *cæteris paribus*, more likely to be of organic origin, than in a young. *The previous history* may furnish valuable information, traces of former syphilis would make it probable that there existed intra-cranial deposit of specific origin, and the existence of valvular cardiac disease would suggest the occurrence of arterial obstruction in the cerebral circulation. On the other hand, the knowledge that the patient was an epileptic would lead us to regard an attack of hemiplegia as probably dependent on the temporary prostration of nervous power induced by the fit, and a previous history of ague and neuralgia might lead us to enquire narrowly whether the brain disorder might not be of the same character. A tolerably *sound and vigorous state of general health* is, in not a few instances, more significant of the organic origin of nerve disorder than a broken and enfeebled. In a person who has been subjected to causes of serious exhaustion, it is not unlikely that the failure may depend solely on deficiency of nervous energy, the general debility being intensified in a particular locality, but this view is out of the question when there is no general debility at all, and the disorder has supervened in the midst of perfect health. *Hereditary tendency* must not be left out of our reckoning. We may hear, on enquiry, that there is a marked liability in the family to head attacks (usually apoplectic) at a somewhat advanced age, or that they are prone to the gouty or neurotic diathesis, and this information may help us to come to a correct conclusion. The *mental character* should also be regarded. Organic lesion is much more likely to be the cause of brain disorder (supposing it present) in a person usually of sound, active, strong mind, than in a semi-hypochondriac whose nervous energy has long been below par. In disorders of organic origin, *the sphincters or the detrusors are more or less enfeebled or paralysed* in the great majority of instances, while in functional disorders they are, as a rule, exempt. According to Brown Séquard, the *temperature of the affected parts* in disorders belonging to the first group is usually high, contrary to what is observed in cases of functional derangement.

The diagnosis of the second group may generally be made from the information afforded by careful examination of the urine. If this lead us to the conclusion that the blood is contaminated by retained urinary excreta, it is almost a matter of certainty that existing nervous symptoms are more or less completely dependant upon this cause. Yet, as a case I shall relate presently shows, organic lesion may occur as an important complication in patients who have appeared to be suffering solely from uræmia. You must not, therefore, conclude too readily that in a given case of uræmia all the symptoms depend solely on the condition of the blood, for this may have induced other events which themselves become highly influential.

A priori one would hardly think that hemiplegia would be likely to result from toxæmia whether of renal or other origin, as the altered blood would act equally on both sides of the brain. Cases have, however, occurred which make it tolerably certain that such an event is possible. Thus Surmay* alludes to the case of a man who, one winter's night went to sleep near a lime kiln, and was intoxicated by the carbonic acid, so that he awoke completely paralyzed on one side of the body. As the hemiplegia disappeared after two days it seems very unlikely that it depended on any structural lesion. Dr. George Johnson writes at p. 197 of his work on "Diseases of the Kidney," when speaking of cerebral complication: "In other cases, the fatal coma is preceded by a sudden hemiplegic seizure, the attack having all the characters of apoplexy from cerebral hæmorrhage;" and subsequently, at p. 304, he relates a history in which this actually occurred, but at the inspection no hæmorrhage was found to have taken place into any part of the brain, only the left corpus striatum was rather soft. Dr. Watson mentions a case of scarlatinal dropsy in which one sided convulsions, coma, and, at length, hemiplegia occurred at the same time that the face and extremities became anasarcous, vol. ii, p. 765. Temporary paraplegia disappearing mostly as the eruption comes out, is occasionally met with in variola. These, as well as other like instances which might be adduced, are easily explicable if we admit what seems to mean established fact that, even in the same body, and same set of organs, different parts differ very much in the strength of their vitality, in the power they possess of resisting injurious influences, or of maintaining their own nutrition adequately under unfavourable circumstances.

I will now narrate to you the case of which I recently spoke, which possesses several points of interest.

A. W., æt. 39, male, painter and decorator, was admitted September 22nd, 1866. His history was that he had been ill six weeks; he had first obstruction of the bowels for a week, since then his liver had been out of order. The last three days he had been very delirious, his speech had been impaired, he tried to speak but could not make himself understood. His sight also had been impaired from the commencement of his illness; he could not see to read; is pallid; urine light coloured, highly albuminous; specific gravity 1010, deposits very little sediment; no anasarca; much emaciated; pulse 99, weakish; heart's sound distinct; pupils medium; head fully warm; is delirious; often gets out of bed at night; does what he is told now; is tranquil, but has a semi-stuporous aspect. In the right lower back there is good resonance and breathing; in the left it is weaker and semi-bronchial, and there is some dulness.

23rd.—Has been very delirious, frequently getting out of bed; has a puzzled vacant aspect. Quantity of urine seems to be good; pulse 105, of good force; takes food well; perspired well in hot air bath; teeth dirty, but there is no blue line; head hottish; visible pulsation of carotids; systolic murmur is heard at base, along aorta, and at the

* Schmidts Jaharb., 1865, vol. 127, p. 300.

normal site of apex heat, not outside the vertical line of nipple; urine continues loaded with albumen; deposits no microscopic sediment.

26th.—Was very drowsy and insensible, but much quieter last night; to day is very imperfectly conscious.

27th.—No urine passed all day ; is quite comatose ; died in the course of the day.

Post-mortem.—Brain found very pale, dryish, the convolutions flattened on the surface of vertex, a large black recent clot as big as a walnut in the anterior part of the middle (right) lobe at the base just behind the fissure of Sylvius. Structure of brain healthy, except at the seat of hæmorrhage, which reached to the surface and stained the dura mater ; kidneys very granular, mottled on surface ; cortex much wasted; some large cysts in right, weight of each four ounces; heart weighed sixteen ounces; the valves were quite healthy, but the cavities contained large fibrinous clots (possibly ante-mortem), and strands of fibrine were interlaced with the cords of both tricuspid and mitral; aorta healthy; posterior parts of both lungs much congested; liver pale, quite healthy. After witnessing the autopsy I enquired particularly as to the existence of any symptoms which might have resulted from the hæmorrhage, and was positively assured by the sister of the ward that he could get in and out of bed till the 24th; she noticed that he preferred to use his left hand rather than the right, but neither were at all paralysed; he used to move the left leg more than the right, but he did move them both, and that to the last. The absence of any marked paralysis in this case inclines me to think that the hæmorrhage did not occur till near the close of life. The clot was evidently quite recent, and could not have been formed long before death. I conceive that the impaired speech, delirium, and coma, were essentially the results of the poisoned blood, in fact, that they indicate different grades of prostration of nervous power, and that the hæmorrhage ensued when the intra-vascular pressure on the precapillary arteries became excessive. There is no doubt that in cases of this kind the altered blood does not traverse the capillaries with its natural facility, and that this is the chief cause of the cardiac hypertrophy which is so common, and which existed in this case. The conditions, therefore, are evidently favourable to the occurrence of hæmorrhage, the minute arteries, which besides are often diseased in their structure by atheromatous change, become incapable of resisting the strain brought to bear upom them by the enlarged heart *a tergo*, and the slowly recipient capillaries *a fronte*. A case, however, which I have recently observed seems to me to afford some notable evidence that relaxation or weakening of the texture of the minute arteries and capillaries has much to do with the occurrence of anasarca. A gentleman had been gravely ill with Bright's disease for several months, but had no anasarca. He then took, by my advice, several Turkish baths, and while using these with much apparent advantage, his feet and lower legs became markedly anasarcous. The anasarca again disappeared almost entirely when the Turkish baths were given up during the last few days of his life. It seems reasonable to refer the production of the anasarca to the relaxing influence of the heat on his vessels. Dropsical effusion is, however, the more usual event. This was absent here, and I have long made the observation that cerebral symptoms are more prone to occur under such circumstances. Effusion of fluid into serous cavities, and the areolar tissue both diminishes the materies morbi circulating in the blood, and lessens the intra-vascular pressure.

The diagnosis of the third class is to be made by consideration of the following points:—1. *The history of the malady.* If we find that our patient has long overstrained his powers, in any of the various ways which we know to be not improbable, as by debauchery, excessive study, speculation ; or if he have passed through a severe weakening disease, or be prostrated by losses of blood, or any other drain ; if he have undergone a surgical operation on some highly sensitive part, as the urethra, or received a severe mental shock, or bodily concussion, if he have suffered from chorea, or any kind of epileptiform affections, or the like; if epidemic catarrh or cholera be prevalent; in fact, if in any way his or her nervous power have suffered severe strain or injury, we should carefully consider whether existing symptoms of nerve disorder may not depend on mere depression of nerve force without demonstrable attention. 2. The *non-permanence of the malady.* If the symptoms are versatile and inconstant, shift their locality, or disappear and recur in some other form, it strengthens the evidence materially. 3. *The effect of remedies.* If from the first, or after the failure of evacuant treatment, tonic and stimulant means have a decidedly beneficial effect, we shall find in most instances that the disease is of functional nature. Yet I shall add a word here for the especial benefit of those who preach up an exclusive port-wine treatment—that if the depression of nervous power be of inhibitory origin, *i.e.*, dependant on remote irritation, no stimulant will be of any avail until the cause of irritation is removed, whether that be intestinal accumulations, diseased teeth, tapeworm, morbid bile, or any like cause. Of this sufficient proof has been adduced by Graves, Brown Séquard, and others, before me. 4. *Some peculiarity or want of accordance in the symptoms.* Thus, if in a case of facial paralysis we find the orbicularis palpebrarum paralysed we have much reason to consider that the disorder is not of central origin, but is the result of cold, or of a fright, or a rheumatic affection of the trunk of the nerve; experience having shown us that in facial paralysis of cerebral origin, the muscle in question remains more or less exempt. Again, in the latter condition, the electro-muscular contractility is so much more preserved than in the former that it amounts to a diagnostic sign.

In cases of hemiplegia the absence of facial paralysis, and *a fortiori* of palsy of the face and tongue, materially confirms the view which might be formed on other grounds, that the disorder is of mere functional character, the so-called hysterical paralysis.

In a case at present under our observation, the existence of very considerable anæsthesia of the skin and muscles of one hand and arm, while the motor power is almost intact, weighs strongly with me to form the diagnosis that the disorder is not dependant on central disease, as, if it were, it is almost out of possibility that the motor nerves could escape. Complete aphonia may occur from strong mental perturbation, or exhaustion, or obscure causes, but this paralysis of the nervous apparatus of the larynx, occurring as an isolated symptom, has not the significance it would have if attended with hemiplegia, or other symptoms of cerebral disease. In both these instances the disorder is probably peripheral, but, on the view that it was central and dependant on organic lesion, there would be a marked discordance between the loss of function in certain parts, and its integrity in others supplied by the same nerve or nerves.

I now proceed to the history of an interesting and remarkable case of nerve disorder proving fatal without any demonstrable organic lesion.

G. R., æt., 33, coachman ; admitted February 15, 1867. His wife, who came with him, and seemed a reliable person stated that he had been perfectly temperate in his habits. He had not been quite well the last two months, but had not been laid up entirely until the last three days, during which he had taken very little nourishment, but had been thirsty. The last two days he had been very drowsy. His earlier symptoms consisted in tickling cough, with some expectoration ; he seemed to have taken cold, and to have increased it. He never had hæmoptysis, but his mother and a half brother died phthisical. Two months ago he had on the dorsum of the left foot a considerable swelling with some redness, it used to subside during the night, and get worse when he went about during the day; it ceased after a fortnight. He never had anything like gout before. The right foot was much less affected. A fortnight ago both hands were numb with sensation of needles and pins ; one hand was affected one day, and the other on the next ; then the disorder ceased. The last

three days he has been as he is now, very drowsy. Is not conscious at all times. Has suffered with pain in head the last fourteen days; much worse the last five; the pain is referred chiefly to the forehead and right temple; is felt severely when he coughs; his head, he says, feels as if it opened and shut. Bowels regular. Urine said to be very pale—copious. At present he is lying in bed on his right side with his head low, his knees bent; it is not easy to rouse him; he resists when I try to look at his pupils, which appear natural. Pulse 96, regular, very weak and small. Marked anæmia, one quasi-purpuric spot on mucous surface of lips. Has had much cold sweating at night lately—no shivering. When I call on him to put out his tongue he rouses a little, and says "Yes, yes," but will not show me the tongue or open his mouth. Temp. 99°32 F. He does not ask to-day for drink as he did yesterday. The urine is found to be bright and clear, of good colour; spec. grav. 1030; contains a large amount of sugar but no albumen. Brandy, 6 oz. Broth diet. Ferri et quinæ citratis, gr. vii. + spt. æth. chlor. ℥xv. + aq. ℥i. *ter die.*

16th.—Had a pretty good night; was rather restless—not delirious. Is more awake and rational this morning; puts out his tongue readily on being asked, which is dry, but clean. Is still drowsy. Pupils rather large—equal. Pulse much more distinct; is still small and weak. Heart's sounds quite normal. He flinches when I press the right iliac fossa, but not when I try the left. A few indeterminate spots on the abdomen. Is very thirsty. Milk, two pints.

17th.—Pulse 100, distinct; respiration 34; temperature 98·2 F. Urine in twenty-four hours amounts to about 40 oz.; spec. grav. 1037; is highly saccharine. The right arm is quite palsied this morning, both as to motion and sensation; it falls quite inert when I raise and let it go. Sensation exists over the region of the deltoid, but is quite lost in the hand; he feels no pinching. He is drowsy, but quite capable of being roused; speaks intelligently; tells me that the right arm was only paralysed this morning, which the nurse confirms; and also describes how far he has any sensation in the paralysed arm. Complains of pain in his head, which is decidedly hottish. Coffee. Brandy 10 oz. Hair to be cut short.

18th.—Became worse at 11 P.M.; was more unconscious at 6 A.M.; was then quite comatose; soon after was convulsed nearly equally on both sides, and died at 8 A.M.

Post-mortem—Feb. 19.—Body spare; rigor mortis well marked. The membranes of the encephalon all appeared perfectly healthy in every part; the large arteries at the base were empty and free from emboli. The gray convoluted surface was pale, the subarachnoid fluid rather abundant, the puncta vasculose were very few, the whole organ was decidedly in a marked state of anæmia. Every part down to the medulla oblongata was carefully examined, but there was nothing whatever morbid to be discovered. The region of the fourth ventricle was very carefully inspected and divided by numerous sections, but all appeared healthy. The same with the pons. The left lung was excavated by a cavity the size of a small orange at its apex; in the vicinity of this were numerous crude tubercles; the lower lobe was healthy. The right lung contained a few tubercles in its upper part, elsewhere it was healthy. Both, however, were very much congested, especially at their posterior parts. The heart was small, but normal—rather flaccid. The kidneys appeared quite normal, only that their cortex was pale. The liver was darkish on section—otherwise normal. There were numerous miliary tubercles in the mesentery. A portion of the small intestine taken from near the ilio-cœcal valve was healthy, one large peyerian patch was somewhat thinned. A careful microscopic examination was made of portions of both corpora striata of the pons varolii, and of the medulla oblongata, but I found nothing in the least morbid except some atheromatous deposits on the wall of one vessel in one of the corpora striata.

In this case, the tuberculous mischief discovered at the autopsy can only be considered to have promoted the operation of the essential cause of death, by having enfeebled the system and lessened its resisting power. Some peculiar depressing agency must have been at work. To some it may appear that the man being diabetic, the enfeeblement produced by this derangement was sufficient to account for the phenomena. I cannot take this view, for the amount of urine passed was by no means large, and he had not suffered seriously from emaciation. I am much more disposed to regard the diabetes as a co-result with the drowsiness, paralysis, coma, and convulsions, of the action of some enfeebling miasm on the nervous centres. An injury in the region of the fourth ventricle, we know, will cause saccharine urine; it is therefore probable that this nervous district was in some way injuriously affected. The symptoms prove that the cerebral hemispheres, the left basal ganglia, the excitable districts, were paralysed, or disordered in their function. The cause of these symptoms escapes our observation, but it seems to me most probable that whatever it was that affected one centre affected all the others. It is a nearly gratuitous hypothesis that the miasm in operation was the influenzal, but it may not be without interest to remark that malaria, that equally unknown but certainly allied agency, is capable of producing the same events, viz.—saccharine urine, coma, palsy, and convulsions. The non-elevation of temperature excludes the possibility of the disease having been low fever, typhus, or typhoid. I can hardly think that the swelling which affected the dorsum of the feet two months before his admission was of gouty origin; it was more probably of rheumatoid, and as such was allied to the fleeting neuralgia which affected each hand for a single day. Cases of this kind are comparatively rare, but not so much so as they are supposed. I have met with a very similar one after an operation for stricture of the urethra, which I have recorded in my Lumleian Lectures. I have mentioned there, also, the case of a man who had paralysis of all four limbs, to all appearance dependant upon, as it was actually coincident with, epidemic catarrh. Dr. Sibson had a case in this hospital some years ago, which proved fatal, and where no lesion was detected on post-mortem examination. The symptoms during life were those of imperfect and shifting paralysis, affecting motion and sensation, special as well as common. A remarkable case recorded by Dr. Levi may be classed with the above, a summary of which will be found in my Lectures above-mentioned. The fundamental idea which I regard as necessary to the comprehension of these and similar cases is, that nervous centres are liable to suffer in a very analogous way to peripheral nerves. The latter, including the tertiary centres in which they are implanted, are certainly liable to non-organic alterations, conditionating pain, numbness, palsy, hyperæsthesia, spasm; and I believe the very same holds good of the superior intracranial centres, only that their disorders give rise to more diversified and special phenomena. The practical value of this view is that it takes you off from always thinking of congestion and effusion when you have to deal with perplexing instances (and how frequent they are) of disorder of the nervous centres.

Original Communications.

ON THE QUALIFICATIONS AND DUTIES OF AN OFFICER OF HEALTH.

By H. LETHEBY, M.B., M.A., Ph. D., Etc.,

PROFESSOR OF CHEMISTRY IN THE COLLEGE OF THE LONDON HOSPITAL, AND MEDICAL OFFICER OF HEALTH FOR THE CITY OF LONDON.

ALTHOUGH the public have had considerable experience of the important functions of an officer of health, yet they by no means comprehend the real duties of the appointment, or the qualifications necessary for it. Even in this metropolis, where, ever since the passing of the Local Management Act of 1855, such appointments have been numerous,

yet there are not two vestries of the same opinion as regards the importance of the office, or the nature of the business belonging to it; and of the scores of towns which have adopted the Public Health Act, and the Local Self-Government Act, there are but few that have fulfilled the intentions of those Acts by appointing medical officers of health, and fewer still that have given vigour to the office by acknowledging its importance. It may be that our own profession is somewhat to blame in this matter on account of its carelessness in dealing with it, for too often has the appointment been accepted without consideration of the responsibilities attached to it. In many cases the duties have been undertaken as a sort of pastime, requiring no more time or attention than can be easily spared in the intervals of practice, and the office has been accepted as an agreeable honorary appointment.

It is needless to say that the ministry of the office, under these circumstances, is not likely to promote the aims of sanitary science, or to serve the interests of the public, or to fulfil any of the intentions of the appointment.

It was not so in ancient time, for we are told that in Greece it was a very common thing for the public authorities to consult the most learned physicians (the Asclepiadæ) on all matters relating to the public health. Hippocrates was, perhaps, the Officer of Health at Athens, and Democedes at Ægina, Athens, and Samos, successively.* Even in our country, where there was danger of pestilence, or an unusual sickness, the most famous physicians were appealed to in behalf of the common weal, and the learned Kaye, who founded the College at Cambridge, speaks of the importance of the office, and of the responsibilities connected with it. Lord Bacon, too, has left us a record of what he thinks were the duties of the appointment, and the way in which they should be performed.

But no one, perhaps, had so good an opportunity of estimating the services of an Officer of Health, and of judging of his qualifications as Parent-du-Chatelet. "It is generally thought," says he, "in the world that the knowledge of medicines acquired in the schools is all that is necessary to become a useful member of the Council of Hygiene; and that to have a diploma, and some patronage, is sufficient to qualify a man for administering thereto." Medical men, for the most part, share this opinion; and on the strength of some precepts which they have collected from books on Hygiene and Medicine, they think themselves sufficiently instructed to decide on the instant the gravest questions, which can only be resolved by special knowledge.

A man may have exhausted medical literature, he may be an excellent practitioner at the bed-side, a learned physician, a clever and eloquent professor; but all these acquirements in themselves are nearly useless in a council of health, and, if an occasion presents itself to make use of them, there are but few persons who can apply them. To be truly useful in a Council of Hygiene, it is necessary to have an extended knowledge of Natural Philosophy, and of the constitution of the soil on which the city is built, and of the geology of the neighbouring country. It is necessary, above all, to know with exactness the effects which trades may have on the health of those who exercise them. To be acquainted with the more important influence of every species of manufactory on the vegetation, the animals, and the population of cities. This knowledge, so important, of the effects of trades and manufactures is not to be acquired by ordinary study or by reading in the library. It is not to be obtained without a technical knowledge of the arts, and of the many processes which are peculiar to them. It requires practice, and the frequent visiting of manufactories. In this particular, more even than with medicine, books are not a substitute for practical observation, and if there exist works on the subject, they are more likely to mislead than to enlighten. From what has been said, and especially when we regard the multitude of subjects to be treated, it will be evident that it is necessary to introduce into the Council those physicians who have made hygiene, and, above all, public and political hygiene, their especial study; and to join with them chemists, particularly manufacturing chemists; for, what would they do before a furnace, or in a matter of practical art, if their lives had been spent in hospitals, or in the exclusive study of medicine? It is clear they would often be deceived by those adroit and skilful manufacturers who would have an interest in concealing the truth.* These observations were made in respect of the qualifications of a member of the Council of Hygiene, but they apply with greater force to the qualifications of an Officer of Health. In fact, the Board of Health of this country in 1855, acting under the advice of their Medical Officer, issued instructions respecting the duties of an Officer of Health which accord in many respects with those of Parent-du-Chatelet. "The Officer of Health" they say, "is appointed in order that through him the local sanitary authority may be duly informed of such influences as are acting against the healthiness of the population of his district, and of such steps as medical science can advise for their removal; secondly, to execute such special functions as may devolve upon him by the statute under which he is appointed; and, thirdly, to contribute to that general stock of knowledge with regard to the sanitary condition of the people, and to the preventible causes of sickness and mortality which, when collected, methodized, and reported to Parliament by the General Board of Health, may guide the Legislature in the extension and amendment of sanitary law.

"The duties of the Officer of Health will be to the following effect:—

"1. He will make himself familiar with the natural and required features of the place, with the social and previous sanitary state of its population, and with all its existing provisions for health, namely—with the levels, inclinations, soil, wells, and watersprings of the district; with its meteorological peculiarities, with the distribution of its buildings and open spaces, paved or unpaved; of its burial grounds and lay-stalls; with the plan of its drains, sewers, and water supply; with the nature of its manufacturing and other industrial establishments, with the house accommodation of the poorer classes, and their opportunities for bathing and washing; with the arrangements for burial of the dead, and with the regulations in force for lodging-houses and slaughtering-places, for the cleansing of public ways and markets, and for the removal of domestic refuse. And if he be the first officer of health appointed in his district, he will, without unnecessary delay, furnish to the local authority a connected account of these matters, so far as they relate to the public health, making thereon such practical suggestions as he may think applicable.

"2. He will invite communications relating to the sanitary wants of the district from the resident clergy, the medical practitioners, registrars, relieving-officers, and other persons or societies engaged in the visitation of the poor.

"3. He will take the best means in his power to become acquainted from week to week, and in times of severe disease, from day to day, with the deaths and sicknesses in his district; and he will inquire to what extent they have depended on removable causes.

"4. With the assistance of such subordinate officers as the local board may empower him to direct and superintend, he will watch his district, taking care to bring its several parts under examination as often as their sanitary circumstances shall require, and especially observing those places which have previously given occasion of complaint, or been subject to sickness. He will inquire as to the cleanly, wholesome, and weather-proof condition of houses; as to their due ventilation and not over-crowded condition; as to the efficiency of their drainage and water-supply; and as to the absence of dampness and offensive effluvia in and about them. He will examine from time to time the drinking waters of the place, and will observe whether provisions are offered for sale in any damaged or adulterated state, that is hurtful or illegal. He will occasionally visit all burial-places, and see whether they give any ground for

* Rumsey's Essays on State Medicine, p. 297.

* Hygiene Publique par Parent-du-Chatelet, Tome 1, p. 4.

complaint, and he will habitually observe the slaughtering-houses of the district and other industrial establishments, which are liable to emit offensive (especially animal) effluvia.

"5. He will report to the local board weekly, annually, and at such intervening times as may require it :—

"Weekly, on all deaths, (classified according to age, cause, and locality), and, so far as may be practicable, on all important sickness of the district ; on such newly observed unwholesome conditions as the local board can remove ; and on the completion, progress, or neglect of improvement in matters previously reported on.

"Annually, on the sanitary transactions of the year, (especially as to the removal of former evils, or the creation of new establishments for sanitary purposes,) on whatever incidental changes have been wrought in the physical state of the district, and on the sickness, mortality and atmospheric conditions of the period—using for these reports, as far as convenient, tabular forms and other compendious arrangements ; and, in every case where he refers to an existing evil, stating what sanitary rule, measure, or appliance he deems best for its mitigation.

"6. He will attend the local board when required, will be present at some convenient appointed place as often as may be needful for the receiving of complaints, and in whatever is to be done for the abatement of unwholesome conditions, will give all fitting instructions, superintendence, and aid.

"For the proper performance of these duties, special qualifications in science are required. These lie in pathology, including vital statistics, and in chemistry, with natural philosophy :—

"In pathology, because the science implies an exact study of the causes of disease, in their relation to the living body—a study of what they are, and how they act, and why they seem to vary in operation.

"In vital statistics, properly a section of pathology, because by analyzing the compositions of various death-rates, and by learning how the pressure of particular diseases differs under different circumstances of climate, season, dwelling, age, sex, and occupation, definite standards of comparison are gained, without which the Officer of Health could not estimate the healthiness or unhealthiness of the population under his charge.

"In chemistry, accompanied by microscopical observation, because without such aid there can be no accurate judgment as to impurities of air and water, dangerous impregnations of soil, or poisonous admixtures in food ; and because the same science also guides the application of deodorizing and disinfectant agents.

"In natural philosophy, because many nuisances are traced, and many questions as to ventilation and overcrowding, are answered by its laws ; further, because by its aid the Officer of Health studies the atmospheric changes, and learns the climate of his district, important steps in proceeding to speak of its diseases ; and, finally, because natural philosophy, in conjunction with chemistry, renders him competent to report on many manufacturing processes alleged to be hurtful to health, and on the sufficiency of such means as are employed to reduce the evils ascribed to them.

"The branches of knowledge here spoken of are parts of every extended medical education, for curative and preventive medicine are founded on a common basis ; but they are not the parts which have most direct relation to the treatment of disease. The most distinguished practitioner of a neighbourhood may, indeed, happen to be also the person best qualified for a sanitary appointment ; but the reverse must often be the case, for not all members of the medical profession can afford equal leisure to cultivate those distinctive studies ; and it will imply no disparagement of men, actively and skilfully engaged in the treatment of disease, if the special qualifications in question should sometimes be found in other members of their profession rather than in them.

"On the other hand, it is important for Local Boards to know that the best training for the general duties of the medical profession is also the best training for the duties of an Officer of Health ; and, in choosing among candidates who have not previously held sanitary appointments, those who have to elect may properly rest on the evidences of general aptitude for a medical career, especially when testifying to methodical and industrious habits, to competent powers, with some previous discipline in scientific observations, to sober judgment, and to thorough conscientiousness in the investigation and statement of facts.

"The duties of an Officer of Health will not usually be inconsistent with his devoting a portion of his time to certain other professional engagements. But, where possible, it will be well to debar him from the private practice of his profession—firstly, because the claims of such practice would be constantly adverse to those of his public appointment, the duties of which (especially at times of epidemic disease, when his official activity would be most needed), private practice would scarcely fail to interrupt and embarrass ; secondly, because the personal relations of private practice might render it difficult for him to fulfil his frequent functions of complaint ; and, thirdly, because, with a view to the cordial good-will and co-operation of his medical brethren, it is of paramount importance that the Officer of Health should not be their rival in practice, and that his opportunities of admonitory intercourse with sick families, should not even be liable to abuse for the purposes of professional competition.

"Objections of this nature will not generally hold against the Officer of Health being professionally connected with the medical school or hospital of his town. Provided such engagements are not of too engrossing an amount, it will conduce to the efficiency and public estimation of an Officer of Health that he be thus kept conversant with the practical aspects of his profession, and have given some security for keeping pace with its scientific progress.

"It may happen that the extent of duty to be required from the Officer of Health in a particular district would not justify the local board in allotting such a salary to the office as would enable its holder to dispense with the income derivable from private practice. But in cases of this description, the object would be equally fulfilled if the local boards of neighbouring towns or districts would combine in engaging and remunerating a properly-qualified person, on the understanding that he should be precluded from private practice, and should act as Officer of Health for the two or more Boards concurring in the appointment."*

It is hardly possible to speak too emphatically of the necessity for the Medical Officer of Health being entirely independent of the conflicting interests of private practice, for they are ever clashing with public duties. The worst places in the worst districts are often the property of men who are the best patients of the Sanitary Officer, and it is not in human nature to oppose itself to its own interests. Too often, in fact, the owners of unwholesome tenements, or the proprietors of offensive trades, or the dealers in adulterated food, force themselves upon the local boards for no other purpose than to protect their own interests, and to check the applications of sanitary measures to their unwholesome properties. This is the experience of almost every Sanitary Officer in the kingdom ; and while local boards are constituted as they now are, it is dangerous for him to be independent. In fact the conclusions of this question go to show not only that the Health Officer of a district should be independent of private practice, and of the general influence which it has on the free exercise of his duties, but also that he should be independent of the local boards. "What approach is there," says Mr. Rumsey, in his 'Essays on State Medicine,' "to security for the free and conscientious discharge of the highest order of professional duties, where the appointment, and the question of salary, and the right of dismissal, are committed to a body representing every kind of influence which is adverse to sanitary control? To the honour of some of the local boards

* Minute of General Board of Health. Dec. 20, 1855.

of this metropolis, and to that of the city in particular, these privileges have not been abused, but have been exercised freely and faithfully for the good of all. But these very exceptions make the common condition of them more striking, by showing how necessary it is that Health Officers should be independent of local influences. This has long since been decided by the experience of the Continent; for when, in the early part of the present century, Health Officers were created in Prussia and in Austria, they were elected, as they are here, by the municipal authorities; but soon it was found that the public interests clashed with the private affairs of the district, and the power of election was withdrawn. Indeed, the Government saw how improper it was to place officers, whose functions belonged to the general polity of the State, in a condition of dependence upon a local body, whose interests were too often opposed to the duties of his office. They saw, also, that the nature of his qualifications, and the variety of his functions, were beyond the appreciation of a municipal assembly. In France, also, the election of a councillor of public hygiene is not committed to a local vestry, but to the Minister of Agriculture and Commerce. It is only in this way that the services of a highly-qualified officer can be secured, and the means afforded whereby his duties shall be freely performed.

Considerations of a public nature indicate that the health officer of a district might be advantageously employed in other duties than those specified in the acts of Parliament relating to the subject, or in the minutes of Council. He might, for example, most usefully superintend the registration of the births and deaths of a district, by revising the returns of the local registrars. It would, perhaps, be too much to expect of him to verify every death, and certify the cause thereof, as is done by the *Médecins des Morts* in Paris, and the *Todten beschauer* in Austria, but it would not be too much to require him to examine and revise the mortality returns of his district, and so bring them into nosological order, and statistical arrangement. This, perhaps, would be the means of securing what is now so sadly wanted, a faithful record of the actual causes of death. It would put a stop to the absurd entries which disgrace the national register, and make it all but useless for statistical purposes. No longer should we have such ridiculous returns as sudden death, death from wounds, ulcers, lungs, spasm, joints, abscess, tumour, cough, exhaustion, want of vitality, and the many other unmeaning terms which make up the 10,000 ill defined deaths upon the mortuary registers for every year.*

But besides the advantage of correct registration, the constant supervision of the mortality returns of a district by the Officer of Health would inform him fully and immediately of the existence of preventible disease, and of the outbreak of an epidemic. It would thus enable him principally to apply his remedies, and to advise the local authorities of the measures necessary for sanitary improvement.

(To be continued).

CEREBRO-SPINAL FEVER: ITS TREATMENT BY MEANS OF ICE.

By JOHN CHAPMAN, M.D., M.R.C.P.,
PHYSICIAN TO THE FARRINGDON DISPENSARY.

(Continued from page 99.)

THE third and last group of symptoms of cerebro-spinal fever I enumerated as follows,—"Symptoms of hyperæmia, proceeding, it may be, to inflammation of the ganglia of the sympathetic: chills, shiverings, flushes, and other morbid variations in the temperature of the skin, constipation, dilated pupils."

I have elsewhere stated my conviction, which is supported by certain well established facts, as well as by analogical reasoning, "that in the same way as gland-cells are shown to become attractive to the blood, supplied to them by virtue of nervous influence exerted directly upon them, so the cells forming all other structures of the organism are endowed with their peculiar elective affinities for those elements of the blood, needed for their nutrition and especial purposes, by the agency of centrifugal, or positive motor nerves operating directly on the cellular elements of each structure.

"Assuming this proposition fairly proveable, we should be able to say of the bodily structures generally that, in addition to the sensory nerve supplied to each, there are two motors: one exercising on the cellular constituents of the structure a stimulant influence, causing it to attract blood to itself; the other by stimulating the muscular coat of the arteries, causing them to contract, and thus to regulate, restrain, or even to arrest the blood-supply. If this doctrine be at once true and applicable to the whole body, it appears that healthy life, like the perfect movements of the planets, consists in a balance or relative adjustment of two opposing forces; and that, while considerable perturbations of those forces are not inconsistent with health, any excessive subordination of the one to the other induces, or, indeed, constitutes disease, in the structure in which it occurs. Inflammation ending in textural death by excessive and therefore exhausting activity of the reproductive force is induced when the positive motor nerves have become exclusively active; anæmia, also ending in death by mere cessation of the vital processes, is induced when the negative motor nerves are exclusively active."*

If the view here expressed be correct, it is easy to perceive that the phenomena of different diseases will, by their distinctive features, denote, in great measure, the different degrees in which the cerebro-spinal and the sympathetic nervous systems are morbidly affected relatively to each other. If, so far as the nervous system is concerned, the morbid influence is chiefly exerted upon the sympathetic, the skin will become cold, the blood-vessels generally will be contracted, the vital processes will be restrained and lessened, and the strength of the whole organism will be impaired: in short, what is called collapse, more or less pronounced, will be induced. If, on the other hand, the cerebro-spinal axis is principally affected, the symptoms of fever, with more or less abnormal activity of the sweat and mucous glands, and of the voluntary muscles, will constitute the salient features of the disease. How it comes to pass that the mysterious morbid influence fixes more especially on one great division of the nervous system, at one period, and, on the other, at another, we are as yet quite unable to tell, and can but study the resulting phenomena, and follow their indications. In cerebro-spinal fever the symptoms of disorder of the two divisions vary greatly in different cases, and denote great varieties in the relative intensity with which each of those divisions is morbidly affected. In one case there is diarrhœa, in another constipation; in one there are chills, shiverings, and it may be a perceptibly cold as well as moist skin; in another, there are flushes, hot dry skin, and fever. There are also, of course, great differences in the condition of the vascular system, at different periods of the disease, and in different parts of the body, in the same patient. The morbidly excessive flow of blood to the brain is likely to be followed, if life should persist, by a corresponding ebb, as in fact is often observed, and hence, while at one time the pupils are contracted, at another they are dilated, and the peculiar character of the mental disorder associated with these different states, accurately corresponds to them. Of course it is necessary carefully to study these different states, and to distinguish them from each other, in order that the treatment may be judiciously modified accordingly. As a general rule, chills, shivering, and perceptible cold-

* At the third anniversary meeting of the National Social Science Association at Bradford, Dr. Farr stated, that in one quarter of a year nearly 22,000 deaths were returned without any authorized statement of the cause; and that only 83 per cent. of all the deaths in England were certified by the medical attendants.—Transactions of Social Science Association, vol. iii., p. 616.

* "Diarrhœa and Cholera: their Nature, Origin, and Treatment, through the agency of the Nervous System." By John Chapman, M.D., M.R.C.P. Second Edition. Pp. 13-14.

ness of the skin, with dilated pupil, indicate hyperæmia of the vaso-motor nerve centres, and the desirableness of acting upon them by the sedative influence of ice.

When there is observable in the surface circulation a distinct ebb and flow—coldness and pallor alternating with heat and flushing—it may be fairly inferred that a like disturbance of the orderly circulation of the blood in the brain is occurring at the same time. This may be advantageously treated by the *prolonged* application of a moderate degree of cold—the use of the spinal ice-bag, with one or two layers of flannel between it and the back.

I cannot insist too strongly on the imperative necessity of watching with the utmost care every symptom denoting the condition of the cerebral circulation: if, under the influence of ice, carefully applied to the head in the manner already indicated, inflammation, or excessive hyperæmia of the brain has subsided, and the depressing force of the cold be still continued, mental disorder may still manifest itself, and, without due discrimination, may be interpreted as evidence of persistence of that vascular condition which the application of ice to the head was intended to subdue; whereas, as already intimated, mental incoherence, low muttering delirium, and even a considerable amount of active aberration, as well as drowsiness and coma, are consistent with, and often symptomatic of, marked cerebral anæmia. Now if, in such cases, owing to error in diagnosis, the application of ice to the head be unhappily continued, the malady will of course be increased, and the death of the patient is likely to be hastened. The medical attendant may aid himself greatly when seeking to determine the actual condition of the cerebral circulation by noting carefully the temperature of the forehead, and even that of the face: if they are cold, or cooler than normal, and if the pupils are fairly dilated, I should be disposed to cease the application of cold to the head, whatever might be the simultaneous symptoms of mental disorder, and should restrict it to the spine, until there were no longer any symptoms indicating the necessity for its use.

I can do no more than mention here the astonishingly beneficial effects of ice applied along the spine in certain cases of insanity—especially if the malady has not already been of long duration. Applied by myself, I have frequently seen it effect an actual transformation of the mind with a rapidity and completeness equally wonderful; I know of several other cases in which a like result has followed its use; and am enabled to state, on the best authority, that its beneficent power in this respect has been witnessed in one of the hospitals in Dublin. I confidently anticipate, therefore, that in cases of cerebro-spinal fever, when the inflammatory stage has subsided, and is succeeded by so-called *functional* disorder of the brain, resulting in insanity, the sheet-anchor of the physician who has to contend with it will be found to be the spinal ice-bag judiciously applied to the appropriate part of the spine. Constipation also, generally indicates a like condition, which, as I apprehend, induces a spasmodic state of the enteric arteries, and thus, lessening the supply of blood to the muscular coat of the intestines, impairs their functional power. It may, however, be due either to congestion or extreme anæmia of those centres whence proceed the motor nerves of the intestinal muscles and mucous glands. In either case these two groups of nerves would be more or less paralysed, the result being, of course, a corresponding diminution, on the one hand, of the vermicular propulsion of the intestinal contents, and, on the other, of the quantity of mucus poured into the canal and facilitating their passage. But it is extremely unlikely that constipation in cases of cerebro-spinal fever will ever originate in nervous anæmia; and it appears to me, therefore, that this symptom, like all the others now reviewed, will be best treated by means of ice applied along the lumbar and lower dorsal vertebræ.

Having now described the method I recommend of treating cerebro-spinal fever chiefly by means of local applications of cold, I will conclude these suggestions with a few words on two or three other resources, which, in certain circumstances, it may be expedient to employ.

If I were called upon to treat the disease in question, and had no ice at command, I should be disposed to rely most hopefully on the process of wet-packing so extensively and, I believe, advantageously used by the hydropaths in the treatment of many kinds of disease. This plan is said to be at once soothing, sedative, and "antiphlogistic"; it produces profuse sweating, and can scarcely fail to contribute greatly towards equalizing the circulation of the blood throughout the body. Indeed, so highly do I rate the remedial value of this process, that in certain cases I should be disposed to combine it with the application of ice as already described, and this could be very easily done. A spinal ice-bag could be applied within the wet-sheet, just as the patient is about to be packed in the surrounding blankets, and, of course, the fact that he is thus packed, would in no respect impede, but would rather facilitate the due application of cold to the head. In the Number of this Journal published on the 3rd of last month, Mr. T. B. Ryan reports a case of "Purpuric Fever" which he treated by means of wet-packing, along with various drugs: the child recovered, and he observes,—"Certainly I would be inclined to adopt a similar treatment if I met with another such case, or a case of cholera."

Drugs, so far as experience of their value in the treatment of cerebro-spinal fever has been reported, seem to be of no avail, and I confess that I should despair of being able to suggest any likely to subdue this formidable malady; still the same principles which would guide me, in the absence of knowledge of its remote cause, to treat its symptoms by aiming to remove their proximate cause, also indicate that bromide of potassium—a sedative of the nervous system, at once the most powerful and practicable of all medicines—is not unlikely to exert a beneficial influence during the period while inflammation of that system manifests itself. Beyond the use of this salt and of simple salines, aperient or not, and with or without ammonia, according to the exigencies of each case, I should scarcely venture to avail myself of drugs in order to combat cerebro-spinal fever; and certainly I should not think of using opium. But if, after the inflammatory energy has been subdued, or has expended itself, the patient should lie exhausted, apathetic, indifferent to surrounding objects, drowsy, or incoherent, with the temperature of the forehead below that of the normal standard, I should hope to do good by administering one or other of the following drugs—bromide of ammonium, sesqui-carbonate of ammonia, quinine, arsenic. If I gave quinine or arsenic I should do so *in very small doses*, and should watch carefully the results.

A common sequela of fevers, rarely noted, however, except in cases of intermittent fever, but one of the most difficult to counteract, is what may, perhaps, be aptly designated, *unstable equilibrium of the circulation of the blood in the nervous centres*. This sequela, in its maximum degree, originates ague afresh in patients who are far removed, both in time and distance, from the primary cause of the disease; lesser grades of it induce flushings and shiverings, a liability to chill from the slightest variations of temperature of the air-currents to which the patient may be exposed, and undue afflux and reflux in the cerebral blood-vessels, resulting in more or less disturbance of the cerebral functions. In these cases empirical observations have fairly established that the best treatment yet known consists in the careful and prolonged administration of *small doses* of arsenic, and elaborate study of the physiological action of this substance leads, *à priori*, to the conclusion that its use is conducive to the equalization of the circulation. Hence, I infer that in the latter stages of many cases of cerebro-spinal fever, arsenic will be found an extremely valuable tonic.

In concluding this series of papers on the treatment, and incidentally on the pathology, of cerebro-spinal fever, I venture to suggest that our knowledge of the essential nature of cholera may be enlarged and deepened by a due consideration of the analogy discoverable between these two

diseases, which have many symptoms in common, viz.—Abnormally copious and pale urine, chilliness, nausea, vomiting, diarrhœa, sweating, cramps, convulsions, headache, deafness, dizziness, drowsiness, faintness, prostration, sense of great internal heat, great thirst, coldness of the surface of the body, blueness of nails and fingers, petechiæ. The likeness might probably be extended further than I have here traced it, but at all events each of these symptoms may be observed as phenomena of both cholera and cerebro-spinal fever. Of course they are not all observable in every individual case of each disease, but if a number of cases of each be studied collectively, they will assuredly be found. Now, the characteristic structural lesion discoverable on post-mortem examination of cases of cerebro-spinal fever is the result of inflammation, congestion, or extreme hyperæmia of the cerebro-spinal axis; and this constant fact inevitably suggests the question—are not the phenomena named above, as well as the other symptoms of the disease, products and expressions of that disorder of the nervous system, physical evidence of which constantly presents itself in the brain and spinal cord? It seems to me that this question admits of but one answer: the phenomena and the underlying structural lesion evidently stand towards each other in a causal relation. But if they do so, then it is reasonable to infer that, inasmuch as those phenomena are also phenomena of cholera, the essence of this disease, like that of cerebro-spinal fever, is, in fact, disorder of the nervous system. Accordingly, when treating of the pathology of cholera, in the work abovementioned, I stated that "all the phenomena of cholera are due to simultaneous hyperæmia of the spinal cord and of the sympathetic nervous system;" and I think it will be found that I have completely proved the proposition.

While pointing out the striking analogy between these dreadfully destructive diseases, I recognise, of course, that they nevertheless differ widely from each other. A careful comparison of all the symptoms of the two would, I believe, be very instructive, and would result in the establishment of the conviction that the differences between them are due to the difference in the relative intensity with which the subtle and mysterious morbific influence causing them operates on each of the two great divisions of the nervous system.

PAPERS ON DERMATOLOGY.—No. VII.

IMPETIGO.

By T. W. BELCHER, M.A., M.Ch., and M.D. Dub., B.M. and M.A. Oxon.

FELLOW AND CENSOR OF THE KING AND QUEEN'S COLLEGE OF PHYSICIANS; PHYSICIAN TO THE DUBLIN DISPENSARY FOR DISEASES OF THE SKIN; &C.

(Continued from 6th Feb., 1867.)

In continuation of some papers on Dermatology, I may perhaps be allowed to recapitulate those already published in this Journal. The following are their respective titles and dates of publication :—

No. I. Sycosis—4th April, 1866.
No. II. Eczema—18th April, 1866.
No. III. Herpes—13th June, 1866.
No. IV. Porrigo—5th December, 1866.
No. V. Prurigo—19th December, 1866.
No. VI. Psoriasis—6th February, 1867.

As several of these have been quoted in various medical journals, and summarised in late volumes of "Braithwaite's Retrospect of Medicine," and [Ranking's] "Abstract of the Medical Sciences," I may, perhaps, be allowed to continue them by making some practical remarks in this paper on IMPETIGO.

Case 1.—S. M., a healthy-looking girl, aged 10, the child of a labouring man who resides at Ringsend, was admitted to the Dispensary for Diseases of the Skin on the 26th of April, 1867, with that variety of the above-named disease, known as "Impetigo Capitis," for a full account of which I must refer the reader to my edition of Neligan on the Skin, p. 192.

In the present case the patient had the disease for some time before her first visit; and when I saw her on the 26th of April the affection was that which is described on p. 193 of the work just quoted, as that form "which is characterised by the eruption occurring in groups of pustules." The local heat and itching were very severe; several of the pustules were torn by the irrepressible scratching which was in vain sought to be controlled. The forehead was not in any way affected, neither was the occiput. The affection was fairly and properly a disease of the scalp; there were not any pediculi to be seen; and the hair was unaltered. Her mother stated that the child had this disease every spring for five years past; but that it usually disappeared before winter.

Treatment.—I desired her to give the child two drams of castor oil, to cut the hair close, and paint the scalp all over with Hebra's Tincture, which I have described in several of my previous papers, and on p. 114 of my edition of Neligan.

She was also directed to take alterative powders of rhubarb and mercury, with chalk; to apply a little of Hebra's Tincture daily for three days; on the third night to poultice the scalp, to remove the mass which had been caused by the disease, hair and medicine all sticking together; and on the fourth morning to wash off all with soft soap, and bring her to me when the scalp was clear.

This she did as ordered, and with great and immediate benefit. The tincture, slightly diluted with water, was directed to be applied and removed as before; the hair still to be cut close, and one dram of cod-liver oil to be given to her thrice daily.

In a short time the scalp was quite clean, the hair well-grown; and the child, to all appearance, strong and healthy. I directed occasional washing of the scalp with soft soap, and continuation of the internal use of cod-liver oil. I have often seen her since, and she is quite well.

Case 2.—P. M., brother of the preceding, æt. five, and a strong and particularly intelligent looking child, was brought to the Dispensary for Diseases of the Skin, on the 7th of May, affected much in the same way as his sister. In his case, however, the disease was apparent on the uppermost third of the forehead; small tumours formed at the nape of the neck; and some of the lymphatic glands behind the sterno-mastoid muscle had become enlarged, and tender. They did not, however, suppurate, nor did the disease extend downwards on the face.

Treatment.—Tincture of iodine made with methylated spirit, as described in my previous papers, and on page 114 of my edition of Neligan; washing the parts daily with soft soap, and taking a dram of cod-liver oil twice daily. The hair to be kept closely cut. Soon afterwards I directed the use of Hebra's tincture, considerably diluted, in the manner detailed in case 1; itching was relieved by stuping with infusion of bran; alterative powders of rhubarb and mercury, with chalk, were also given, as in the former case, and on Monday he took two powders of compound jalap. The child got rapidly better, but having met with an accident, he was kept from the dispensary for a while, and the disease returned again. It was, however, treated as before, and with like success, save that the diluted Hebra's tincture was not so long continued as in the former case, inunction of cod-liver oil having been substituted for it with good effect. The child is now well and strong; and in this, as in the former case, the hair grew with unusual rapidity. I could give details of other cases, but the preceding will suffice to illustrate the disease on which I will now make a few practical remarks.

IMPETIGO, derived, according to Pliny, *ab impetu, impetu agens;* is the *Dartre crustacée, Lépre humide* of the French; *Zittermal, der kleienaussatz* of the Germans; and *crusted tetter* in our own language. According to Neligan, and other standard writers, it is a *pustular* affection, as distinguished from Eczema, which is vesicular. Erasmus, Wilson, Hardy, of Paris, and Hebra, of Vienna, all first-

class authorities, believe it to be an eczematous affection. In point of fact, any one engaged in the routine of cutaneous practice will find no small difficulty in adhering closely to either of these opinions, particularly when a case, as it often does, presents features peculiar to both affections, as described in books. In eczema impetiginodes, as seen among the poorer classes in this city, it is very difficult to discern, at times, between one and the other.

Varieties.—Neligan described three varieties. *Impetigo figurata*, when the disease appears in patches of a circular or ovoid shape; *impetigo sparsa*, when the pustules are developed individually, and appear scattered over the cutaneous surface; and *impetigo capitis*, which, Dr. Neligan remarked, "is the only pustular disease which appears exclusively on the scalp."

Contagion.—Dr. Neligan was of opinion that impetigo is not contagious; and I have seen many cases, which, so far as they went, fully justified this opinion. On the other hand, Dr. Tilbury Fox, in the *British Medical Journal* for May and June, 1864, has fully described a form of this affection which was epidemic among the patients at the Farringdon General Dispensary, and which he believed to be contagious. Now, this very day (2nd Aug., 1867), I have under my care three cases (a brother and two sisters) in which there is strong evidence in favour of contagion, and little on the other side. In the two detailed above, it must be said that they were also brother and sister, and there is some presumption in favour of contagion so far as they are concerned—balanced, however, by the facts that both were fed on poor oatmeal diet; both lived in a fishing neighbourhood; and that none of their *other* brothers and sisters living with them have contracted impetigo.

The question is a practical one, and medical men are often asked—"Should children so affected sleep or go to school with healthy children?" To this, the safe and prudent answer is—*No.*

Causes.—Impetigo most frequently occurs in infants and children; it is frequently connected with dentition, and with the scrofulous diathesis. Irritants applied to the surface, such as washing in very hot water, using hard hair-brushes and fine tooth-combs, stimulating soaps, solar and igneous heat—commonly get the credit of determining its origin.

Diagnosis.—It is *pustular*, and when fully developed in typical cases, has crusts of a semi-transparent, soft, greenish-yellow, honey-like appearance. From eczema impetiginodes it is, as I have already said, with difficulty distinguished at times. Yet, where the diagnosis can be made, the peculiar ichorous exudation and epidermic desquamation of eczema will suffice. From ecthyma, which has large or *phlyzacious* pustules, it is distinguished by its small or *psydracious* pustular eruption. In scabies, the pustules, where such occur, are large and conoidal; besides,—the peculiar symptoms which make "itch" the Anglican synonym for scabies, and the acarus scabiei, which is mostly present in this latter affection, will distinguish it from impetigo.

From *Sycosis* it is distinguished by the facts that, in that affection the disease affects the locality of the beard, is not truly pustular; the crusts are hard and dry, and of a brown colour; and, most important of all, microscopic examination discloses the presence of a vegetable parasite.

Prognosis.—Favourable. It is rebellious in adults and in old persons; and in young persons is liable to return in the summer and autumn months. Its obstinancy is said to be in proportion to its previous duration, but in all the cases which I have seen, my experience has not led me to confirm this opinion.

Treatment.—The constitutional treatment should obviously be different in the young and plethoric; in the old and debilitated; and in the debilitated and strumous child. The green iodide of mercury may be advantageously used in chronic cases, also the arseniates of soda, and of ammonia. The gums of infants at the breast should be examined, as they occasionally require to be lanced; and alkaline treatment at this age is most serviceable. The *local* treatment is, however, the most important in this affection; and in the cases above detailed I have sketched the general idea which may be developed in particular cases according to age and condition. For the irritation and tingling commonly attendant on the acute stages—no remedy equals chloroform; and after many trials of hydrocyanic acid I have almost entirely abandoned it in favour of the former. Alkaline applications are also very useful, and particularly so when combined with chloroform. All kinds of irritating food should be avoided, and, so far as possible, milk and farinaceous diet should be adopted.

CONTRIBUTIONS TO THE COMPARATIVE ANATOMY AND PHYSIOLOGY OF THE GALL BLADDER.

By ALEXANDER MACALISTER, L.R.C.S., L.K.Q.C.P.;
DEMONSTRATOR OF ANATOMY TO THE ROYAL COLLEGE OF SURGEONS; ASSISTANT-SURGEON TO THE ADELAIDE HOSPITAL, AND ONE OF THE HONORARY SECRETARIES OF THE ROYAL GEOLOGICAL SOCIETY OF IRELAND.

THE numerous variations in the conditions and development of the gall-bladder, in the different orders of vertebrata, would lead us to expect that this organ would be, in man, the subject of many mutations, simulating its states in other and lower animals; while its position and relation to such an important and frequently diseased organ as the liver, render it liable to various forms of morbid change or injury. As in many animals possessing livers, we find no trace of this cavity, it seems to hold the position of an accessory or non-essential appendage to the hepatic system, and on tracing it through the different ranges of vertebrate forms, it seems, at first sight, to be capricious in its development or absence. As, however, it may be taken as an axiom in anatomy, that nothing is developed in nature for which there is not an adequate use in some form or other, it becomes an important inquiry what is the direct object fulfilled by this sac, and what are the conditions in which its presence is requisite?

In our search after the determination of these questions, we will examine—

1. Its normal condition as found in the animal kingdom.
2. Its development and abnormal morphological states in man.
3. The physiological bearings of its different varieties.

1. In the order Bimana, it is present and constant, and as, to some extent, elucidatory of its general structure in the other parts of the animal kingdom, we will glance at a few facts regarding its normal position and composition in man; in him it is placed, as in most other mammals, anteriorly between the quadrate and right hepatic lobes, it is pyriform in shape, with its base forwards and to the right, usually, and in the undistended state of the stomach, touching the abdominal pariet for an extent of from a quarter to half a square inch, corresponding to the external border of the right rectus abdominis muscle in a line with the tip of the cartilage of the tenth rib.[1] Its neck looks backward, upwards, and to the left, the centre of the fundus being about five-eighths of an inch farther from the mesial line than the axis of the neck, the amount of this lateralization, however, has a close relation to the size of the liver. It is usually capable of holding from six to twelve drachms,[2] averaging about ten, after death, however, when no obstruction occurs, it seldom contains more than from one to two teaspoonfuls of bile.

It is wide at the fundus, then slightly constricted about two-thirds towards the neck, and from thence tapering towards the narrowest part or neck proper, where it joins the cystic duct. It is divided by anatomists artificially into a fundus, body, and neck. The latter is slightly convoluted in a manner which has often been described im-

1 Cruveilhier refers to a case of gallstones in which, so close did the fundus of the sac come to the abdominal wall, that a perceptible sound of their rubbing could be elicited by pressure.

2 The same author alludes to cases on record in which 6-10 pounds of bile were found in the sac.—Anatomie Descriptive, Tome ii., p. 578.

perfectly. When the sac is moderately distended it, first, will be usually found to be curved with its concavity downwards, then turning a little to the left, then, being concave upwards, it turns into the commencement of the cystic duct; these convolutions are best seen when the peritoneum has been carefully dissected off.

In length the sac is usually from three and a quarter to four and five-eighths inches in length, and from two to five inches and three-eighths in circumference at its fundus. At its neck it averages from five to seven lines in girth; from the fundus to the first constriction is usually two and a half to two and three-quarter inches, and from this point to the neck measures from seven-eighths of an inch to two inches. These measurements are deduced from the dissection of many subjects. During the past few winter sessions I have carefully examined this sac in seventy instances, and the results given above are taken from these examinations.

Of its entire area, when moderately distended, nearly one-half is directly in contact with the liver, more than one-twelfth touches the anterior abdominal wall, one-sixth is in contact with the pylorus, superior transverse portion of the duodenum, and lesser omentum, and the remainder rests near or upon the right extremity of the transverse colon. These relations, however, are liable to hourly changes. Distension of the colon displaces the duodenum, and pushes forward the abdominal wall. Gastric fulness suffices, after death at least, to approximate more closely the pylorus and gall-bladder, and the respiratory or other contraction of the abdominal wall can produce many degrees of relational varieties.

The coats of this sac are properly five—serous, cellular, fibro-muscular, submucous, and mucous. The first of these invests from three-fourths to four-fifths of the sac, it covers the entire fundus which may project to the extent of an inch and an eighth, or even more, beyond the anterior edge of the liver, or may not extend even to the level of the thin margin of the gland. Most commonly the space uncovered with this serous investment, in which the sac directly lies in contact with the liver, is two inches and a half long, and from three-quarters to an inch and an eighth wide. I have found twice, in about a hundred and fifty subjects, the existence of a distinct mesocyst, or freefold of peritoneum, consisting of two layers of serous membrane in opposition, and containing lymphatics, uniting the detached and pendulous gall-bladder to the under surface of the vesical fissure of the liver, and continuous posteriorly with the lesser omentum. A proportionally larger portion of this cavity is invested with serous membrane in the flaccid than in the distended condition, and of the circumference of the sac, a larger part is covered proportionally at the extremity of the body, near the fundus, than at the neck. Very rarely—once in two hundred and sixty subjects—I have seen the hepatic substance deficient completely over the fundus and body of the gall-bladder, and a part of this cavity covered with the peritoneal investment of the convex surface of the liver. More commonly this sac does not extend to the free edge of the liver, but its fundus has a downward tendency, and a fold of serous membrane, or partial mesocyst, intervenes between the prominent extremity and the under surface of the organ. The serous covering is much more deficient in the fœtus than in the adult.

Beneath this exists the second, or cellular coat, which unites the former to the subjacent fibrous layer. This is loose and indistinct beneath the peritoneum, but very strong and laminated where it comes in contact with the capsule of Glisson, with which it is inseparably connected. It is composed of a soft areolar tissue, frequently containing fat globules of a large size, more especially towards the cervix. In some cases of obesity, I have seen this lamina very much thickened, even to the extent of a quarter of an inch. (This condition, however, is not a necessary concomitant of fatty degeneration of the liver).

Beneath this layer can be easily demonstrated a third very strong complex lamina of a fibrous nature, forming a complete envelope, thickest at the centre, and becoming thinner to the fundus; composed of bright, shining, white fibres, which run mainly in a circular or rather oblique direction, intersecting and uniting with some longitudinal fibres, which lie on a place superficial to the main series of circular fibres. The latter are stronger at the first constriction, where they sometimes form a slightly marked belt. Each of these fibres, when examined microscopically, is found to consist of dense fibro-areolar tissue, containing very distinct fusiform muscular fibre cells, which are in length, according to Kölliker, from 0·03‴ to 0·04‴. This histologist describes these as placed both longitudinally and transversely, and says nothing of the relative proportion of the two sets, but in the observations which I have made upon this point, I have not been able to detect more than one-fourth of the fibre cells and areolar bands in the former direction. He likewise mentions that these involuntary muscle cells possess indistinct nuclei, but these in all cases escaped my notice. These cells are narrowly tapered at each extremity, and are more numerous at the neck than near the fundus.

The actual muscularity of this sac has been denied by many authors, but it is not only capable of distinct proof by the microscopic investigation of its constituent textures, but by direct experiment. Haller[1] demonstrated its contractile power, and Engelbert[2] records that he has seen the fibres directly contract when irritated. Folia,[3] in his paper on the peristaltic motion of the intestines describes the contraction of this sac upon the irritation of its walls by nitric acid, and both this author and Engelbert record the same result as following the galvanic stimulus. Distinct muscularity was first demonstrated by Amussat,[4] but denied by Boyer, Blandin, Cruveilhier,[5] and Portal. Kölliker, Meyer, and Huschke[6] have, however, set the matter at rest, and my own observations have satisfied me of their accuracy. Some anatomists have described three separate muscular strata, longitudinal circular, and oblique, but even in the instances of a hypertrophied muscular coat, I have not been able to demonstrate more than the two very obscurely separate sets of fibres already noticed, both constituting but a single lamina. Meyer[7] has traced two sets of fibres ascending from the intestine towards the fundus of the sac, the superficial stratum being longitudinal, and the deeper oblique. These are especially seen in the vicinity of the neck, but I have not found the proper muscular tunic of the gall-bladder to be continuous with these, which, although demonstrable on the duct, I have seldom found extending beyond the cervical extremity of the sac.[8]

The fourth or cellulo-vascular sub-mucous lamina is thin and contains the chief blood-vessels, lymphatics, and nerves of the organ. The superior and inferior branches of the cystic artery, derived from the right hepatic, ramify in an arborescent manner, and freely anastomose in the substance of this coat. Each artery is accompanied by two lateral veins destitute of valves, which, commencing in the mucous coat, pierce into the sub-mucous, and flow backwards, coalescing with neighbouring trunks, and finally terminating in the vaginal branches of the right division of the vena portæ. The lymphatics are very numerous, and form frequently anastomosing loops over the entire sac, especially near its neck; passing backwards they form usually five large trunks, which, by their frequent communications, surround the neck of the sac, and accompanying the ductus communis choledochus, pass into a distinct and tolerably constant lymphatic ganglion, which is situated above the head of the pancreas, behind the right end of the superior transverse portion of the duodenum, and to the

8 Drake was among the first to demonstrate the muscular coat as consisting of longitudinal and transverse fibres. He described a Sphincter, which, however, does not exist. Anthropologia Nova 1727. Vol. i., p. 105. Blancard described two sets of fibres in 1695.

right of the before-mentioned bile duct. The nerves of the gall-bladder, which, in comparison with those of the rest of the liver, are proportionally numerous, are derived from the right branches of the hepatic sympathetic plexus, and they usually form a smaller vesical plexus about the left side of the cervix of the sac.

The fifth, or lining mucous membrane, has been aptly compared in appearance to the reticulum of a ruminant, or to the lung of a serpent, as it is marked out into polygonal depressions or alveolations, somewhat resembling the foveoli of the lining membrane of the vesiculæ seminales, but more regular. This membrane is covered by a lamina of cylindrical epithelium,[1] after death thoroughly stained by the bile pigment, of a brownish or green colour. Cloquet, Cruveilhier, and Boyer, describe the mucous membrane as being white or greyish white during life, and state that the staining is purely a post-mortem appearance, and accordingly on opening the gall-bladder of some animals, a cat or a monkey for instance, immediately after death, the epithelial coat appeared to me destitute of any bile stain. The outer coats of the sac are not at all stained until a short time after death, nor till then does the transudation colour the neighbouring peritoneum, colon, and duodenum, in the manner so universally met with in the dissecting-room.

The reticular arrangement of the basement layer is due to the presence of bands of dense fibrous non-muscular connective tissue in the substance of the basement membrane, and these cross and interlace regularly with each other, thus causing the polygonal, circular, and square forces on the interior surface. Wilson,[2] in speaking of this arrangement says, "the internal surface is raised into innumerable small ridges and folds by the ramifications of the cystic artery and its capillaries." Now, although these vessels, when fully injected, do project on the mucous aspect, yet it only requires a careful examination and dissection of an uninjected cyst, to show that the foveoli may exist totally independent of all vascularity. In an injected sac, however, it will be noticed that the arteries dip from the submucous into the mucous coat mainly in the line of these ridges, and hence the mucous membrane is more tightly tied to the basement layer in the line of these idges, and this probably accounts for the observation made by Hassall, that the mucous membrane can be raised by forcible inflation, from the sub-mucous beneath in the interspaces of these ridges.[3]

These rugæ are larger, and more prominent at the first constriction, but become finer and smoother toward the neck. The fundus is marked by foveæ nearly as large as those in the centre, but separated by very faint ridges, and hence they are usually described as being finer than those in the centre. In each of these ridges is enclosed a close capillary plexus of minute blood-vessels, closely resembling, in arrangement, those on the villi of the jejunum. In some of these ridges a few very small oval glandular follicles are present, especially on those situated in the centre of the sac. These, I think, have not before been noticed. A few other genuine mucous crypts are to be seen at the bottom of the alveoli, but they are much more scattered and fewer than some authors have described. These are simple mucous follicles, and appear to be lined with glandular epithelium. Besides these simple crypts, Professor Luschka, of Tubingen,[4] has described a third set of glands: racemose in nature, and said to be grape-shaped, each composed of a distinct basement wall embedded in a filamentous series of bands of connective tissue, but according to his description, not possessing an epithelial lining. These are filled with granular particles, and a thick alkaline mucous; from six to fifteen of these are mentioned as existing, but I have counted six in a small piece of mucous membrane a little more than half an inch square. Hassall (loc. cit.) has described a second series of four or five pits at the base of the primary foveæ, and a third group of still finer crypts forming the bottoms of the second set, the latter only discernible by microscopic aid, but many of these, I think, may be considered as but superficial irregularities on the mucous surface, and not proper secreting follicles, this arrangement of alveoli within alveoli I have found more distinctly in the bladder of a large pointer dog than in the human sac.

The cervix in man exhibits a slight sacculation, variable in amount, and comparatively obscure until the serous and cellular membranes are dissected off; then it becomes more apparent. When laid open we find there an appearance which has been the subject of much exaggeration in description and figuring. The mucous lining, whose alveoli have been gradually becoming finer, and whose surface has been gradually growing smoother towards the neck, exhibits in the commencement of the duct certain nearly transverse folds projecting from half a line to two lines into the centre of the duct, and placed at an obtuse angle with the central axis of the neck of the sac, which here describes a sigmoid curvature that has been compared by Cruveilhier to an italic letter *S*. The folds are usually from three to nine in number, but I have seen as many as sixteen, or even in one instance twenty. They are sometimes supplemented by a few smaller plicæ above them. The upper or cystic valves are longer than those nearer the duct, and they are somewhat crescentic in outline. They are more prominent when the duct is distended, and although described by some anatomists as situated nearly at the centre of each dilatation or turn of the sigma, yet in reality they seem to have very little, if any, relation to the curvature of the tube. They extend generally from one-half to two-thirds round the tube, and when thus disposed they are usually nearly equal upon the two sides. I have seen them disposed in two lateral series, with their free edges directed towards the sac, and their attached borders alternating to the right and left. In some other cases I have seen them arranged in a single series, all directed the same way, and although generally ending towards the cystic duct with some degree of abruptness, I have, but rarely, seen them gradually shaded off, and finally lost in fine reticulations on the mucous surface of the tube. Few structures in the body exhibit so many individual variations.[1]

(To be continued.)

1 Virchow describes the epithelial cells of the gall-bladder as similar to those of the small intestines, and has found them filled with fat, which he supposes they have absorbed from the bile.

3 Hassall.—Microscopic Anatomy of the Human Body, vol. i., p. 415.

4 Luschka. Die Drusen der Gallenblase des Menschen.—Henle und Pfeuffer's Zeitschrift, 3 Reihe, vol. iv.

1 As an instance how far belief can stimulate observers to the perception of imaginary structures, we may instance the hepato-cystic ducts, so long supposed to exist in man. Many old books contain descriptions, and even plates, of these. For example, Riverius, liber. 2, cap. x., p. 183; Paris, 1545. Valverdus, lib. 3, cap. viii., p. 186, and fig. xii.; Venice, 1589. Also, Realde Columbus, De re Anatomica, lib. xi., p. 427; Blancard, Anatomica Reformata, tab. xliii., fig. 3. Archangel Piccolhomini seems, however, to have surmised the proper use of the duct, as occasional at least. Anat. Præelect., lectio. xx., p. 129; Romæ, 1586.

Hospital Report.

MEATH HOSPITAL AND COUNTY OF DUBLIN INFIRMARY.

ANEURISM OF THE RIGHT SUBCLAVIAN ARTERY, TREATED BY DIRECT PRESSURE ON THE ARTERIA INNOMINATA.

Under the care of Mr. PORTER,

SENIOR SURGEON TO THE HOSPITAL.

In the number of the Medical Press and Circular for July the 3d, we reported this case of subclavian aneurism, and mentioned that Mr. Porter had placed an acupressure needle under the first stage of the patient's axillary artery. This treatment, for a time, promised to be most satisfactory, the tumour reduced in size, and became more firm. The needle was removed in fifty-three hours without the slightest appearance of hæmorrhage, but the pulsation gradually returned, and became as strong as before the operation.

The wound healed perfectly, and the man was up and walking about in three weeks.

As the disease was increasing rapidly, Mr. Porter determined to attempt the cure by placing direct pressure on the innominate artery.

July 31.—Mr. Porter laid bare the vessel after a tedious and careful dissection, which occupied nearly forty minutes. The operation he selected was almost similar to that performed by Mott. Instead of using the acupressure needle and wire, as on the former occasion, he employed a most ingenious instrument invented by Doctor L'Estrange, which somewhat resembles a double aneurism needle without eyes. It is furnished with a moveable handle. One blade is first carried under the vessel, and the second is then passed down on the artery, and is made to compress it like the manner in which the jaws of a lithotrite are closed, with the exception of the blades of this instrument being perfectly smooth and rounded. The blades are approximated by means of a screw, and when sufficiently brought together the handle is removed, leaving the needle in the wound. The patient bore the operation well, and all pulsation in the tumour was arrested by the instrument. He did not suffer the slightest inconvenience from shutting off the current of blood from that side of his head. A bag of ice was then applied to the tumour.

August 1.—He had passed a good night; felt no pain unless when he swallowed. His breathing was quite normal. Pulse 95; complained of slight thirst. The tumour more solid, but a faint pulsation had returned.

2nd.—Slept well. The wound looking healthy. He still complained of pain in swallowing, but at no other time. At half-past one o'clock P.M., Mr. Porter tightened the instrument, which again arrested pulsation. The aneurism is decidedly harder. Half-past nine o'clock P.M., Mr. Porter removed the needle; no blood followed, but pulsation returned strongly in the aneurism.

3rd.—He passed a very good night. The wound is healing fast. All pain in swallowing gone. The tumour harder, but still pulsating. A small bladder containing ice and shot applied.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 7, 1867.

THE COLLEGE OF PHYSICIANS OF LONDON AND ITS FELLOWSHIP.

WE have witnessed of late, in quick succession, the coming and going of several of the "powers that be;" and, if "coming events cast their shadows before," we may build upon the speedy arrival, at the Royal College of Physicians, of another and the greatest potentate of all—*King Progress.*

With some, we opine, he may not be at first a welcome guest; but, if to his wise and liberal voice they condescend to lend, though an unwilling ear, they may at length confess it tells of pleasant ways—such as would lead the College on to win "honour, love, obedience, troops of friends," and speedily to stifle all that bitterness of feeling which its well-known unfairness to so many of its members has begotten; an unfairness felt with increasing pain by all who respect the College, as it can admit of no manner of justification.

While some half-dozen candidates, or even less, presented themselves annually for examination, there might have been a show of reason on the part of the Council for the limited admission of Licentiates annually to the Fellowship. Of late, however, such a plea has been totally inadmissible. The vast influx of members during the year of grace demanded that the College should be far less niggardly in the number of members annually submitted for election (for they have, on the average, scarcely exceeded the number admitted prior to the year 1859).

And if some amount of patronage must be visible in the nomination list of members, it should not, most assuredly, be used to the prejudice of those of longer standing, and, it might so chance, of greater claims. This is the one sore point with many who, had they otherwise remained for life unelected, would never have had the indelicacy to utter a single murmur.

No member could possibly seek the honour of the Fellowship, if he thought for one instant that his admission to it would not be agreeable to the Fellows at large; but many at least might covet the opportunity of the appeal, and are naturally dissatisfied in proportion as they find such opportunity year by year dwindling away. To permit any member (save for unusual reasons) to be placed in such a position, is unworthy of the Council.

Recently, by opening its portals still wider, and by creating a triple grade of rank, it would appear as though the College sought the appellation of a truly *National Institute.* But, with a *façade* of *Liberalism,* it would like to retain within, incongruous forms of exclusiveness and secrecy to harmonise with its traditional policy. It is these elements of that policy which caused such heartburnings in the olden time, and these the elements which would sever both allegiance and esteem in that to come. There is no tribunal so dangerous as that with closed doors. The scales of *Justice* ought to be openly seen in fair and steady equipoise. We would fain believe such policy to be now short-lived. It is, as has been justly said, an anachronism—one strongly repugnant to the sentiment of the Profession. To that sentiment the College ought unhesitatingly to defer. In the matter of the Fellowship, the Profession must henceforth constitute the ultimate *Court of Appeal.* Its verdict, also, must be received as final. Indeed for

our own part, could we believe that the Profession generally deemed us *worthy* of an honour, its actual acquisition would become a matter of very subordinate importance.

THE LICENCE OF THE COLLEGE OF PHYSICIANS (LONDON.)

This question, to which we devoted our last week's leader, continues to excite much interest. We stated the real points in dispute as fairly as possible. The fact that our opinion has excited diverse statements, is sufficient proof of our impartiality. We do not see the utility of mixing up other subjects with this. Such a course only leads to mystification. Whether the College of Surgeons will or will not unite with the College of Physicians, ought not to make any part of a discussion on education. The truth is, that in the ranks of the College of Physicians, no class is at this moment satisfied. The greatest efforts are being made to enlarge the body of Licentiates. To succeed in this, some one's interests must go to the wall. The Fellows can take care of themselves. The Members have no vote. They have fulfilled their function of aiding to fill the College coffers. Nothing more is to be squeezed out of them. They consequently present ready victims for the sacrifice, and having no means of communication with each other, or with the other world of Fellows, they are concluded to be without sensation, and any operation may therefore be performed upon them, without giving rise to a charge of cruelty.

NOSOLOGY.

The attempt at a universal system of nomenclature of disease, undertaken by the Royal College of Physicians of London, will shortly be placed in a completed form before the Profession, and will then require full analysis. In the meantime, we may state, from a preliminary inspection of the proof-sheets, that the labours of ten years do not seem likely to be lost. There are many points that are certain to be generally adopted, and when we mention that the medical advisers of the Registrar-Generals of the three kingdoms, have given valuable assistance to the Committee, we have said enough to secure for the forthcoming work the attention to which it is entitled. Hitherto an international classification of disease has been a dream. It is not certain that the Committee will not have taken a step towards its realization.

Notes on Current Topics.

The British Medical Association.—We learn with much satisfaction that the proposition of Dr. Seaton to change the name of the Association to "The Medical Association of Great Britain and Ireland," to which we took exception in a late issue, has been withdrawn. It seemed to us imprudent to raise the questions which must arise out of such a suggestion. If the British Medical Association be ever a representative of Ireland, which the characteristics of the professional systems in the two countries seem to us to forbid, it will be none the less so under its present title.

Honorary Fellowships.—The Council of the Royal College of Surgeons in Ireland met on Thursday last, to consider the propriety of granting the Honorary Fellowship of the College, in connection with the visit of the British Medical Association to Dublin. It was decided that the distinction should be conferred on Professor Syme, of Edinburgh, and Mr. Bowman, of London, should those gentlemen visit Dublin, in consideration of their eminent services in Surgery and Physiology respectively.

Mr. Syme is Surgeon in Ordinary to the Queen in Scotland; a Member of the Medical Council; a Fellow of the Royal College of Surgeons of Edinburgh, of forty-four years standing, as well as an Honorary Fellow of the College of Surgeons of England, and a Fellow of the Royal Society of Edinburgh. He is also Professor of Clinical Surgery in the University.

Mr. Bowman is an Honorary Fellow of the Royal College of Surgeons of England, a Fellow and Medulist of the Royal Society, late Surgeon and Professor of Physiology to King's College Hospital. His contributions to Ophthalmic Surgery are well-known, while his researches, in conjunction with the late Dr. Todd, on Physiological Anatomy, have gained for him well-merited celebrity.

The Forthergillian Gold Medals.—The subjects for these prizes are announced by the Medical Society of London as being "The Diagnosis and Treatment of Non-Malignant Tumours of the Uterus," to be competed for in March 1868, and "The Curability of Cancer," in March 1869. The essays are open to members of the profession in all countries.

Eastbourne New Convalescent Hospital.—A house was opened at Eastbourne two years ago as an hospital for convalescents. This was effected chiefly through the exertions of Miss Brownlow Byron and the Sisters of All Saints' Home, in Cavendish-square. The applications for admission were so numerous that they could not be all entertained, and it was found necessary to provide more adequate accommodation. A sum of £10,000 has been subscribed for this purpose, and a site of five acres of land at Meade has been purchased of the Duke of Devonshire, on which to erect a new building capable of containing 100 patients. On Tuesday week, the foundation stone was laid by Lady Fanny Howard. One wing of the new building is to be devoted to the reception of thirty incurables. It is thought that £12,000 more will be required to complete this hospital. The ceremony attracted a large number of visitors of both sexes, who afterwards partook of luncheon. Speeches were made on the occasion, when £300 were contributed to promote the object.

Compression of the Innominate Artery for Aneurism.—The case of subclavian aneurism under Mr. Porter's care, in which acupressure was applied in the first stage, as reported in our issue of July 3, did not result in a cure, though the tumour became smaller and more firm. On Wednesday last Mr. Porter cut down on the innominata, and after considerable difficulty compressed it with L'Estrange's instrument. Since the removal of the compressor, three days afterwards, the pulsation returned. This is, we believe, the first case in which the occlusion of the innominata was effected by this means in Ireland. The details will be found amongst our Hospital Reports.

THE OPHTHALMOLOGICAL CONGRESS.—This assembly, which was to have been held at Vienna last year, and was stopped by the late war, will open its sessions in Paris on the 12th inst. M. Giraud Tenlon and M. Wecker are the Honorary Secretaries.

NOMENCLATURE OF DISEASE.—The Committee appointed by the College of Physicians of London to form a plan for a new and systematic nomenclature of disease, presented their report to the College on Friday last. The report is in great measure based on the technology adopted by the Registrar-General, and is introduced by a preface from the pen of Sir Thomas Watson. This work has occupied not less than ten years in its completion, it having been entered on in 1857.

THE PUBLIC HEALTH.—The mortality of London during the thirtieth week of the year, was once more below the average. Allowing for the increase of population, the Registrar-General's returns show 106 deaths less than the estimated number. Nevertheless the deaths from diarrhœa continue to increase, a fact, however, that can excite little surprise, considering the period of the year. In the week ending June 22, there were 16 deaths registered from this disease. Since then, the weekly numbers have been 48, 54, 115, 170, and 196 respectively. In the corresponding week of last year, there were 349 deaths registered from diarrhœa in addition to a mortality of 904 from cholera, which was then epidemic in the metropolis. The figures, on the whole, are not discouraging for the season, though that is no reason why vigilance should be relaxed. The interesting information supplied by Professor Frankland, respecting the water supply, appears in a new shape in this week's return. We are told that 100,000 tons of the London water, contained from 24 to 39 tons of extraneous substances. The amount, in a like quantity of the Glasgow water, was only 3 tons. The Kent water taken at Deptford, was the hardest and altogether the most impure of these impure supplies. The figures are very suggestive, and deserve the thoughtful attention of all sanitarians. The annual rate of mortality was, during the week, 23 per 1000 in London, Dublin, and Edinburgh; 22 in Bristol; 21 in Birmingham; 27 in Liverpool; 34 in Manchester; 27 in Salford; 21 in Sheffield; 24 in Leeds; 20 in Hull; 26 in Newcastle-on-Tyne; and 23 in Glasgow. When will Manchester take steps to bring down this frightful figure?

MEDICAL SCANDAL.

GREAT as our admiration may be for the editor who fearlessly calls "a spade a spade," and soars above the opprobrium which always attaches to the naked truth, we are reminded now and then that a journalist has responsibilities to the public for the veracity and morality of what he publishes, in direct proportion to the privileges which publicity confers on him. He who, in his private capacity, ventilates scandals or publishes inaccuracies can inflict but little injustice because the dictum of such a person generally carries with it little respect, and because he cannot scatter his venom beyond his own vicinity. How much then does it behove the person, who under the cover of the almighty "We," repeats his words into thousands of ears, and with a more than human authority, to be cautious how he adopts or countenances statements prejudicial to character and prospects without the best reason to know that his facts *are* facts, and his opinions are good sense. Editors cannot be infallible, but they may be cautious, and it is no part of their *role* to obtrude the criticism where their public interests do not demand an expression of their opinion, even if they confine themselves to strictly accurate facts.

The *Medical Mirror* for June devotes six pages to a semi-editorial article under the title of "Medical Gossip of the Month," which, despite our feeling against editorial squabbles, we do not feel ourselves justified in passing by without comment. The communication takes the form of a colloquy between a mythical *dramatis personæ*, and is written in a style with which we are too well acquainted. As a psychological curiosity, and a mental exercise, it is worthy of perusal, the only intelligible part of it being the personalities which are intended by the author to supply the place of the literary smartness, of which no smack appears.

From Holt's dilator to Catnip tea; from the tailor's strike to Kidd's notion on anæsthetics—the author wanders, appearing to consider, as we do, no one idea worthy of a second paragraph. We do not take up our pen to complain of the style, which is a simple matter between the author who perpetrates it and the editor who accepts it without reading it (or, worse still, after perusal), and the subscribers who are victimised; but we do protest against the most justly-respected of our Profession being at the mercy of such a pen as that of the author. Right and left, with an impartiality which is the only creditable feature of the effusion, English and Irish Surgeons and Physicians are villified in sneers which are not the less hurtful because they are meaningless, and by inuendos which, appearing in a public journal, and ludicrous to those acquainted with the persons aspersed, may still have weight with those who do not know that they are unjust and inaccurate. The following extracts express the general sense of the communication, and carry a severer condemnation than we can utter:—

[SCENE:—CRITO (like the *Lancet*) is for all prescriptions in English, FRORIEP all in Latin, and so C. F. I.: one is astride on the edge of a library table, the others at their best, when REPORTER and HARVARD fall in, and there is a talk, de omnibus. "Latin is the salt that preserves the profession," says FRORIEP; CRITO calmly detests pharmacopeias, orthopædic surgery, Latin; believes cholera not infectious; a serio-comico ethical congress necessary at Dublin; there is a talk of dinners and conversaziones at Apothecaries' Hall, and who lost by the "Oaks." But we must not anticipate.]

C. F. I.—Latin! of course I stick up for it, and so do you. Our school at Guy's you may say is now purely theoretic; *you would not give a fig for what Wilkes says of practice of physic*—there you are right; *no more than what Callander objects at St. Bartholomew's* to acupressure.

REPORTER.—They are both, I admit, simple "dead house" men, *excellent* at *post-mortems, rather than men of ethics or experience*—or——

HARVARD.—America is obliged to you. Q is right; our journals are very high class; time and distance best doctors—*temporis ars medicina fere, &c.* Agassiz quite opposed *to infidel notions* of Huxley, Carpenter, Eoozoon, hippocampus, and all.

HARVARD.—Eh? *conversazione* of the Medical Council! Catch me going there again; a half-dozen mere wooden nutmegs now rule our societies—practice diminishing—quackery going up—Melbourne recognised, but not American M.D.

HARVARD.—I 'spects as how, eh? the Council is paid for by the entire profession. Why not the entire profession represented, not little Hawkins? Bah! crown nominees, delegates-diploma market, solemn gold mace. Bah! Hawkins, &c., al, sounding brass and tinkling symbols.

CRITO.—I mind it weel. Cholera nae infectious. Its as bad

as orthopædic surgery dinners, or this wee bit of sorcery of anodyne mixtures, cloves, chloroform, and candle lighting, the new dodge, *or that Prothero Smith's nonsense.*

REP.—This black death in Dublin. Is only typhus allowed to grow black! Haughton, of course, is all hypothesis. Look at the journals! whoever in the world reads these speeches of the Council.—(REP. skims through the "weeklies," not at all pleased.) *The ranks of the homœopathists, specialists, quacks, are strongly recruited from Irish and American physicians, because Dr. Jacob stops the way.*

We cannot think that the editor of the journal in which this lucubration appears would, except inadvertently, have permitted his pages to be stamped with the well-known imprint of such sneering personality; and now that we have called attention to it, we trust he will no longer open the pages of a hitherto high-class journal as a refuge for journalistic destitution, or an engine for the ventilation of petty jealousies.

Foreign Medical Literature.

CASE OF OSTEOMYELITIS SPONTANEA DIFFUSA.

By P. THILESEN.

TRANSLATED FROM THE NORSK MAGAZIN FOR LÆGEVIDENSKABEN, XXI. BIND, I. HEFTE, CHRISTIANIA 1867, P. 3.

By WILLIAM D. MOORE, M.D., Dub. et Cantab., M.R.I.A.;

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS; OF THE NORWEGIAN MEDICAL SOCIETY; AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; SECRETARY FOR SWEDEN, NORWAY, AND DENMARK, TO THE EPIDEMIOLOGICAL SOCIETY OF LONDON.

(Continued from page 113.)

Dissection—Cavity of the chest.—Integuments over the tumour on the chest very thin, semi-transparent; sound on percussion tympanitic (came on subsequently in consequence of the development of air in the part). After preparation of the skin and connective tissue air was evacuated by puncturing the tumour, upon which it completely collapsed. The tumour consisted of a great abscess cavity beneath the integuments and through the thoracic muscles. This extends from the second rib on both sides downwards to the fourth intercostal space on the right and to the third on the left, transversely over the sternum from the extremities of the ribs on the right to a little outside the ends of the cartilages of the ribs on the left. The body of the sternum forms a great opening in the posterior wall of the cavity, by which it communicates with the mediastinum anticum, the individual pieces of the body no longer hang together, the cartilaginous connection between them reciprocally, and with the cartilages of the ribs, has disappeared; the middle piece lies completely separated in the mediastinum anticum, the superior and inferior are attached to the manubrium sterni and the ensiform process, but are detached from the costal cartilages, and, like the middle portion, are stripped of periosteum on both surfaces. The intercostal muscles are preserved, but the pectoral muscles are in great part destroyed. The ends of the costal cartilages are attenuated and pointed, semi-transparent, greyish. The walls of the cavity are uneven, formed of half separated flakes of gangrenous tissue, and lined with greyish scanty pus. The surrounding muscular structure, with the subcutaneous connective tissue, is pale, œdematous, and emphysematous, especially over the neck, and over the right side of the anterior wall of the thorax. In the mediastinum anticum is an abscess cavity, connected with the external one, of about the same size, but extending a little further to the left beneath the costal cartilage, and not reaching quite so far to the right as on the other side—superiorly it reaches almost to the neck; inferiorly to the middle of the pericardium, all the connective tissue being loose, the fatty tissue destroyed, and the cavity tolerably deep. The fundus is formed of the mediastinal pleura, the lateral surfaces are composed of the edges of the lungs attached to the costal pleura. The margin of the right lung reaches nearly to the ends of the cartilages of the ribs, that of the left not farther than to the extremities of the ribs, and the adhesion is here imperfect, so that pus has sunk down between the lung and the pericardium, and thence down to the base of the cavity of the thorax. The contents of the cavity are the same as those of the external one. The walls are less uneven. The heart and the great vessels are everywhere covered by the mediastinal pleura. In the part of the mediastinum below the cavity is the ordinary fatty tissue. No pus has penetrated down into the mediastinum posticum. The left pleura contains, besides a quantity of thin greyish pus, a large amount of thick fibrinous exudation lining both the pulmonary and costal walls, and the diaphragm. The lung is half adherent, half free, only anteriorly is it completely attached. The pleura is everywhere thickened, uneven, injected, here and there ecchymosed; the lower lobe of the lung is devoid of air, not compressed, but tolerably heavy, infiltrated with turbid serum, and rather congested. The surface of section is smooth, the pulmonary substance is soft; down from the base yellowish grey infiltrated striæ extend up through the pulmonary tissue for a short space without any acute demarcation. The upper lobe contains air, but is not overloaded with it. There is nothing in the pulmonary artery. The right lung is everywhere adherent. The adhesions are œdematous and infiltrated with blood, the pulmonary tissue contains air. In the pericardium is blood-coloured serum in tolerably large quantity, nothing else.

In the abdominal cavity is nothing important. Some small abscesses in the kidneys.

Right Lower Extremity.—The head of the femur is half luxated, hanging only loosely in the acetabulum; the cartilaginous rim has almost disappeared; the round ligament is softened and torn asunder. The cartilage on the head is gone, that on the acetabulum has almost disappeared. In the joint, which is open, is a reddish puriform fluid, the neck is carious, denuded of periosteum, which is wanting also in the upper third of the thigh, on the anterior surface of the bone. The trochanter major is turned backwards, and is loosened from the femur, its surface of insertion on the femur is carious. The trochanter minor, which is turned directly forward, is loosened from the bone (the cartilage is gone), and hangs attached only by a cord of thickened, half ossified periosteum, which, beneath the trochanter minor forms a prominent edge, continues thence obliquely down over the inner surface to the boundary between the superior and middle third, hence proceeds over the anterior surface, and turns at an acute angle obliquely upwards and outwards around the external surface towards the trochanter major. Above this line the denuded smooth bone has begun to be superficially necrosed with commencing demarcation parallel to the ridge of periosteum. Everywhere beneath this edge the periosteum is, on the contrary, considerably thickened (about 2‴) and half ossified down to the knee, and can be torn from the subjacent, normal, smooth cortical substance. It can be cut through with some difficulty, and bony passages are then seen on the surface of section. Upwards, on the posterior surface, the thickness of the periosteum diminishes, and from a short distance beneath the inter-trochanteric line the bone is denuded, and farther up is carious. Around the denuded bone and the thickened periosteum externally, a cavity with thin chocolate-coloured pus is met with from the head of the femur to the inferior epiphysis, superiorly all around, inferiorly chiefly on the outside from the ligamentum intermusculare posticum to the anterior surface. Between the muscles on the anterior surface is seen in one place a hemorrhagic, spotted infiltration, which also extends partly into the muscle. Inferiorly, externally, and posteriorly, just at the transition to the epiphysis, the periosteum is softened to a puriform, fibrinous mass. Hence an infiltration, of the same appearance, passes through the rarified bone into the me-

dulla over the cartilage of the epiphysis (which is itself normal), and continues thence up through the whole femur with alternating dark brownish, red, and greyish yellow discolouration of the medullary substance. The greyish yellow parts can be taken out in the form of oblong plugs, look almost like decolourized thrombi, and lie in smooth walled spaces in the spongy substance. Superiorly, this change reaches, it would appear, as far as the carious basis of the trochanter major. The cortical substance on the anterior periphery of the shaft of the bone is normal; on the posterior, on the contrary, it is spotted red, as if rarified by the intrusion of reddish medullary space. The knee-joint and the epiphyses are normal.

The dissection, therefore, confirmed the diagnosis so far, that we became assured that no aneurism was present; that the collection above and beneath the sternum consisted of pus; and that the primary disease was an affection of the bone, which had given rise to the development of a pyæmic condition. But the dissection showed what, as I have said, had not been previously assumed, that the affection was an *osteomyelitis spontanea diffusa* of the worst kind, especially such as Chassaignac describes it.

The course of the disease was about as follows:—Probably without any connection with the earlier excoriation of the toe and the subsequent inflammation of the same, a commotion of the bone occurred, directly or indirectly, during dancing, in the course of which there arose either slighter, more molecular changes in the medullary tissue, exhibiting themselves only by alterations in the nutrition of the part, or greater and ruder changes, as minor fractures of the fine osseous framework in the interior of the medullary canal, and ruptures of small vessels with consecutive extravasation of blood in the tissue. These—to judge from their cause—certainly not considerable changes, sufficed in this individual, evidently predisposed to disease of this kind, to produce inflammation in the medullary tissue, with its consequences—the formation of granulations in the canal, with rarefaction of the bony tissue, and purulent infiltration of the medulla in the whole length of the diaphysis. The inflammation was soon propagated to the spongy substance, especially superiorly in the neck (ossitis rarificans). It went on to an ulcerative destruction (caries of the neck, the part over the inter-trochanteric line, the surface of insertion of both trochanters). At the same time, there was destruction of the articular cartilage, inflammation and accumulation in the joint, and separation of both trochanters. Inferiorly, and there indeed under a double influence, both by a propagation of the osteomyelitis and by the purulent periostitis attacking the bone, did a *degenerative ostitis* at the same time arise with a result bordering upon carious destruction of the bone. The whole cortical substance anteriorly and on the sides remained sound; posteriorly, on the contrary, the cortical substance was affected. Here, too, a development of fœtal medullary tissue, granulating tissue in the natural cavity of the bone, with rarefaction of the substance, seems to have commenced. Anteriorly, as I have said, the shaft of the bone was uninjured, with the exception of a spot above, where it was denuded of periosteum; and partly on account of this, partly by reason of predisposition thereto arising from the other affections of the bone, did a slight superficial necrosis of the same set in. Along with the osteomyelitis, and of course induced by it, we see a periostitis in the whole length of the thigh, principally of a purulent, but partly, also, of a fibrous, ossifying character. Superiorly over the necrosed part there was probably purulent periostitis, with a collection between the bone and the membrane *(periostitis purulenta dissecans)*, which caused its destruction. Inferiorly, and particularly posteriorly, we see a purulent (interstitial) periostitis through the whole substance of the periosteum, which is everywhere infiltrated with pus. The most central part was especially the seat of a fibrous and ossifying periostitis, with great thickening of the membrane. I may here remark upon the great facility with which the latter was separable from the bone. The deposition of pus from the purulent periostitis of course produced in the surrounding soft parts a violent phlegmon with copious suppuration. The processes in the bone must have run a very rapid course—thus, even at the close of the second week, we find the abscess formed in the mediastinum, and fully-developed pyæmia. Whether the pains and tenderness in the shoulder-joint were also of pyæmic origin, cannot be positively decided, as this joint, unfortunately, was not examined at the post-mortem.

As the case came under treatment at so late a period, nothing certain can be stated as to the chronology of the different groups of symptoms. Judging from the early violent pain in the region of the hip-joint, and the change in the position of the extremity, the articular affection must have occurred unusually early.

(To be continued.)

REPORT TO THE REGISTRAR-GENERAL ON THE METROPOLITAN WATER SUPPLY.

By Dr. E. FRANKLAND, F.R.S.

ANALYSIS OF THE METROPOLITAN WATERS FOR JULY, 1867.

1 Companies.	2 Date and Place of Collection.	3 Total solid impurity in 100,000 parts.	4 Organic Carbon.	5 Nitrogen as Nitrates and Nitrites.	6 Ammonia.	7 Total Combined Nitrogen.	8 Previous Sewage Contamination (Estimated.)	9 Total Hardness.
THAMES.

Loch Katrine ...	FEBRUARY. Glasgow.	3·28	·256	·031	·002	·041	0	0·3

For the purpose of comparison, I append also the results yielded by Loch Katrine water, as supplied to Glasgow, when submitted to the same analytical processes. The numbers in columns 3, 4, 5, 6, 7, 8, and 9, all relate t

100,000 parts of the waters. The table is to be read thus: 100,000 lbs. of Chelsea water collected on 1st July, at the Horse Guards cab-rank contained 26·54 lbs. of solid impurity; the organic matter constituting a portion of this impurity contained ·212 lb. of carbon. This solid impurity also contained ·204 lb. of nitrogen in the form of nitrates and nitrites, besides ·006 lb. of ammonia, whilst the total amount of *combined* nitrogen in every form was ·209 lb. The above quantity of water supplied by the Chelsea Company had been, after its decent to the earth as rain, contaminated with sewage or manure matter equivalent to 1105 lbs. of average filtered London sewage.

By gradual oxidation, partly in the pores of the soil, partly in the Thames or its tributaries, and partly in the reservoirs, filters, and conduits of the Company, this sewage contamination had been entirely converted into comparatively innocuous inorganic compounds before its delivery to consumers. Finally, 100,000 lbs. of the Chelsea Company's water contained 19·7 lbs. of carbonate of lime, or an equivalent quantity of other soap-destroying ingredients.

The Southwark Company's water was slightly turbid when drawn from the main.

ROYAL COLLEGE OF CHEMISTRY.

London, July 27th, 1867.

ANNUAL MEETING
OF THE
BRITISH MEDICAL ASSOCIATION.

TUESDAY, 6TH AUGUST, 1867.

THE proceedings of the Association, held this year in Dublin, commenced with the customary formalities. The retiring President, Dr. Waters, of Chester, having resigned with a few farewell observations, the President-Elect, Dr. Stokes, delivered the following inaugural address:—

MR. PRESIDENT OF THE COUNCIL AND GENTLEMEN,—My first duty on taking the chair, which, during the past year, has been so ably filled by Dr. Waters, is to return thanks for the honour you have conferred on one personally a stranger to most of you, in naming him as your President, on the first visit of the Association to Ireland. Your Society is one altogether peculiar in its organisation, and in which we recognise the union of the three kingdoms for objects that are good and consequently great. And so we are proud of our institution, proud of it as followers, and, therefore, as teachers of science, for every man who practises medicine or surgery in a true spirit, is himself at once a learner and a teacher. Yet it is not on this ground alone that the British Medical Association is to be considered; for, from its very beginning, more than a quarter of a century ago, it has kept other, and in a sense, higher objects in view. It has in good earnest sought to raise the social status of medicine, by the labours of science on the one hand, and the labours of love on the other. And in this object the records and experience of the past show that it has been successful. It has largely added to the scientific reputation of British medicine and surgery, and it has advanced the social concord of that great body of our brothers who are engaged in the Godlike art of healing, which is like mercy, "blessing him that gives and him that takes." We seek to draw closer to one another all men who in good faith and honour work for the sufferer in body or in mind, no matter what may be their respective stations, their degrees, or ranks in society; no matter what may be the class or position of those for whom they labour; for, to the true physician—I use the word in its widest sense—sickness levels all ranks, and we can affirm of our brethren that the friendless and the destitute receive at their hands a sympathy and a care which often surpasses that which station or wealth can command. These works are done, though as yet the world knows but little of them. They are done instinctively, following the precept and example of the founder of our religion, the right hand unknowing of what the left hand doeth. They are done through a special influence, as yet not fully recognised, of the study and the practice of medicine upon the understanding and on the heart. Therefore, to draw closer the various members of the varied ranks of our common profession which, in one sense, is the most united, and in another and a lower sense, has been the most divided, is a great and worthy end. It is to bring the force of the whole to bear on the common weal, and by union to strengthen the hands of the separate workers in the exercise of that power which is animated by charity, guided by knowledge, and which observation rendered fruitful by study, makes every day more and more an instrument of good.

Of the influence of the science of medicine on the understanding, it may be said that that science has it in common with every branch of knowledge which is based on observation and induction, but that it animates the heart is also true; for to do good, even from necessity, moulds all so engaged unwittingly to themselves to be more or less ministers of Christ's work upon earth. It is plain that this result of the exercise of our profession should work in all directions, and that in our relations to one another we should apply the same qualities of mind and feeling, the same self-abnegation, the same enlightened and catholic spirit which is the great result of our work.

In the earlier states of civilisation, man gathered himself into families or tribes, which, from natural causes, became mutually hostile, and therefore ignorant of one another; hence a state of war became their normal condition, and even now, when, by the consolidation of tribes, great empires are founded, our peace, when it does prevail, is an armed peace.

It was to remedy a similar state of things in medicine, which, at least in this country, embraced many tribes whose interests were held to be separate, and whose relations were mutually hostile, that, in founding the Associations, Sir Charles Hastings and the far-seeing men who worked with him, kept in view its operation, not only as a scientific body, but as a means of promoting friendly feelings by the personal interchange of kindly offices, a means of getting rid of prejudices and of neutralising those corporate jealousies so long the bane of our profession. Thus, they not merely hoped, but foresaw, that the time would come when that profession would be bound together as a united body, looking ever upwards, and strong in mutual respect and mutual confidence.

The experience of the working of the Association warrants us in holding that, in a large measure, these anticipations have been fulfilled, and already we can see the proofs of a sounder feeling amongst members of our profession. And this result has a wider application than appears at first sight; for it must largely subserve to the interests of society. This has been excellently put by Sir Dominic Corrigan, in a speech lately delivered at the inauguration of the statue of Sir Henry Marsh in the College of Physicians, on the harmony and the mutual respect which has so long distinguished the profession in Ireland, and on the advantages which thereby accrue to the public at large.

Looking at the great question of the social and scientific advancement of medicine, we find that among the general desiderata there are some dependent conditions more or less extrinsic to the Profession. Many of these have been ably handled by Mr. Rumsey and other writers on State Medicine; but to obtain them will be a work of time, depending first on the education and consequent influence of the profession itself, and next on the progressive enlightenment of society and of government.

In the practice of medicine, as it exists in these countries, two methods exist: one, in which the trade element, which, if not the governing principle, is at least very prominent, and the other the professional. The gradual elimination of the first, and the consequent advance of the second, are great objects for all who seek to raise the status of our call-

ing in a social and scientific point of view. Medicine is not any single science: it is an art depending on all sciences. Indeed, it may be said that there is no branch of human knowledge that does not in its turn subserve to it; and, therefore, were there no other reason, its social status should be at least on the same level with divinity or law. Not so much by the possession of honour or titles here or there distributed, but by the comprehensions of the general education of those who enter it. If we look to the *Medical Register*, we shall find that the number of individuals holding such qualifications as imply a course of education in arts, such as is the rule in the sister-professions, is very small, and this reacts on the scientific character as well as the social rank of medicine.

In most cases a general cultivation of the mind is the best preparation for the pursuit of any special branch of knowledge. It may be held that it is unnecessary to insist on this. I am sorry to say that I hold a different opinion. It is most necessary to insist upon it. It may be said that compulsory education interferes with the liberty of the subject, but does not ignorance enslave and degrade for life?

Among the general desiderata of medicine are others, some extrinsic to it, many of which have been so ably handled by Mr. Rumsey and other writers on State Medicine. But to obtain them is a work of time, depending, first on the education and consequent influence of the profession; and, next, on the progressive enlightenment of society and of government.

Yet there are objects of good which are attainable by ourselves, and of these I may specify two among many. The determination of the laws of epidemics, and the placing our knowledge of therapeutics on something of a scientific basis. It was held by Humboldt, as we read in his *Cosmos*, that the question is one of the most obscure and difficult of inquiries. And here I may recall to your minds the proposition of Graves, that the different governments of the combined world should unite in the establishment of medical observatories in their respective dominions in the various latitudes of the earth, where a careful record of every meteorological and terrestrial phenomenon should be kept with all the accuracy of the latest science in connection with observations of the rise and progress of every epidemic. Thus a combined series of observations would, after a time, lead to knowledge, negative or positive, as the case might be, which would be invaluable.

The second desideratum is to settle the therapeutic science which, at present, is little more than traditional empiricism. Not the less valuable and trustworthy on that account; for in all traditions there is an element of truth. What is wanting, is to have applied to therapeutics the same method of scientific investigation which is used in other enquiries. This all important question has been raised in the Medical Council, which is charged with the care of our national Pharmacopœia, and it was proposed by Dr. Acland that a portion of the funds should be used to defray the expenses of scientific investigations as to the value of medicines. The powers of the Pharmacopœia can reject or admit this or that, and, until the values of these medicines are established by severe investigation, we shall go on in the old way. I refer you to the discussions in the last two sessions of the Council. Dr. Acland's motions were lost, but they had the support of a strong minority. It is hoped that he will persevere. A similar course was taken by Professor Bennett at your last meeting; but the museum must be considered as his well-deserved and noble monument, and a small grant of money was made to him to initiate observations on the value of a single remedy. We all look forward with interest to his report and to the debate which is to follow.

Before I conclude, I may ask your attention for a few minutes to allude to some details in connection with the present meeting. It has appeared to the Council that, looking at the probable amount of work to be got through, it would be wise to adopt the system of lectures; and it has resolved that lectures for Medical Surgery, Midwifery, and Physiology, should be instituted in the nomination of the Presidents and Secretaries of these Sections. It was the desire of the Local Committee that some of these offices should be filled by members from the other side of the water, but in obedience to a wish generously expressed at the meeting of Council in Birmingham, at which I had the honour to attend, these offices have been filled by the profession in Dublin; and we think that the Association will not have cause to regret our election of these distinguished gentlemen.

You will perceive, by referring to the programme issued by the Central Council, that it has sought to remedy a defect admitted by many in our former meetings, namely, the introduction of the current or official business during the time which should be occupied in the scientific labours of our body. It is recommended that we should get through all the necessary and official work on the first day, leaving the remaining days to be devoted to the addresses in medicine and surgery, to the reports on questions for debate, and to the working of the various sections. To ensure success to this project, it is manifestly necessary that members who address the meeting will condense whatever observations they have to make as much as possible.

To the inquiring stranger, Dublin presents many objects of interest, and one of the first of them is this great College, within whose walls we are now assembled, with its noble library, schools, and museums. The Museum of Geology in connection with the School of Engineers will well repay a visit, as well as the School of Physic and its recently erected laboratory, dissecting-rooms, and museum of materia medica. The libraries of the Royal Irish Academy, the Royal Dublin Society, that of Queen's Inns and of Archbishop Marsh, are all worthy of inspection.

I have spoken of our Museum of Geology. The great Anatomical Museum of the Royal College of Surgeons, and the Pathological Museum of the Richmond Hospital, created by the energies of Professor Smith, contain many objects of interest. I may notice two more museums, though not of a medical character, the Industrial Museum in Stephen's Green, and the Museum of Irish Antiquities in the Academy, a collection of national antiquities only inferior to that of Copenhagen, and for the foundation of which Ireland is indebted to her great antiquary, the late Dr. Petrie. The Botanic Gardens of Trinity College, and those of the Dublin Society, should be seen, as well as the Zoological Garden, the grounds of which were once the pleasaunce of the Knights of St. John.

It was long the wish of Sir Charles Hastings and those who laboured with him, that the operation of this body should be extended to Ireland. This wish was expressed at the Edinburgh Meeting in 1856, held under the presidency of the illustrious Alison, and during the first session of the Medical Council Sir Charles Hastings spoke on the subject with some of the Irish representatives on the Council. At this time, however, it was considered that, looking at local circumstances connected with the working of the new Medical Act, the necessarily unsettled state of medical education, it was better to postpone the visit of the Association to Dublin for a few years. In this view Sir Charles Hastings fully concurred; he hoped that the time was not far off when all difficulties would be removed, and the event has justified the anticipation, and now in the name and by the permission of the heads of the University of Dublin, it is my happy privilege to bid you welcome. This University, long the fosterer of its Medical Faculty, and by whose wisdom, as in the old English Universities, the academic rank of Medicine and of Surgery is kept on a footing of equality with that of Divinity and Law, has done its best to honour the Association, and to make its visit memorable in academic record by crowning with its highest honours our President of Council Dr. Sibson, and some of the foremost members of your body; and so we meet in the halls of Usher and of Berkely, of Swift and Burke and Goldsmith, of Curran

and Grattan, of Hamilton, M'Cullagh, Lloyd, Hearne, and of Graves.

The address in medicine will be given by the distinguished representative on the Medical Council of the Queen's University in Ireland. The President of the Royal College of Surgeons will take the chair at the surgical lecture; and the committee of reception contains representatives of all the medical corporations. The visit of the Association has a special significance, as being the first ever paid to Ireland; and we rejoice to see so many representatives of British and Scottish medicine and surgery coming among us—the representatives of so truly an enlightened section of British Society.

The history of Ireland is a singular one. More than a thousand years ago, she was the centre of the Christian civilisation of Western Europe. Once vanquished, though not conquered, by the Northman—torn by internecine war, and exhausted by fruitless contests with England, she at last united with her; and the two countries are now beginning to know one another better, and to excuse or explain or forget what was wrong on either side, and to know and estimate that which is right. According to the use that is made of them, and according to the amount of truth or untruth that may be in them, the traditions of the past may be fruitful in evil or in good. But with the advance of education, of intelligence, and, above all, of intercommunication, old ignorances, old prejudices, old memories of wrong, and forgetfulness of right, will fade away. This visit will hasten the time when the crown of our loved Sovereign will surround and embrace in its golden circle an united and a happy people. That day is coming; and therefore it is clear that this meeting has a national as well as a scientific importance, which recommends it to all loyal and all right-thinking men.

HARVEIAN SOCIETY OF LONDON.

MAY 16, 1867.

Dr. POLLOCK, President, in the Chair.

HISTORICAL SKETCH OF THE NON-MERCURIAL METHODS OF TREATING SYPHILIS.

By BERKELEY HILL, F.R.C.S.,

ASSISTANT-SURGEON TO UNIVERSITY COLLEGE HOSPITAL.

THE object of this paper was to show how all the many non-mercurial modes of treating syphilis had fallen into disuse after their fashion had passed away. At the beginning of the sixteenth century, syphilis was treated by blood-letting, purging, starving, and sweating in hot chambers, with the administration of a host of nostrums. To these, mercurial inunction, already employed in other diseases of the skin, was added a few years later. Guiacum was introduced into Europe in 1508, and in consequence of the disastrous effects of the virulent salivation caused by over-dosing with mercury, it became the popular remedy throughout Europe. To guiacum, sarsaparilla and other varieties of smilax were added in the course of the seventeenth century. Thus the "decoction of the words" was formed, which held its ground even to modern times. Nevertheless, authors of the sixteenth and seventeenth centuries, though urging the decoctions to be employed, advise recourse to mercury when they fail of success. Mercury thus grew more and more into favour, especially in this country, where Sydenham, Abercromby, and other writers of the seventeenth century, declare mercurial treatment to be the only effectual one.

In Egypt, and Northern Africa, the disease was treated by sweating and purging as in Europe, though in Algeria the example of the French, is causing the adoption of mercury for treating this disease.

Opium and nitric acid had each, at the close of the eighteenth century, a short lived reputation, as specifics in syphilis.

Iodide, first suggested by Coindet in 1820, and administered by Carmichael, in 1832, as iodide of potass, has earned a reputation of indisputable value in the treatment of certain forms of syphilis.

The great discovery in the nature of syphilis was reserved for Rose, and those military surgeons who, early in this century, by allowing venereal affections to run their course unchecked by treatment, found that syphilis tends to cure itself. and that mercury could be dispensed with in many cases, Nevertheless, Rose, Thomson, Friche, and others, when publishing their experiments, made the error of not waiting till sufficient time had elapsed after infection for the affections of the bones to develop before they concluded that the non-appearance of disease in the bones depended on the non-administration of mercury in the early stages of syphilis. Further experience convinced the British surgeons that tertiary affections and relapses of the disease occur in patients who have not taken mercury. Rose, especially, soon returned to the use of mercury in the treatment of syphilis—his reasons, according to Mr. Cutter, being "that he could cure them in half the time with mercury that he could without." Thomson also, by 1827, had resumed the use of mercury in syphilis.

Irritation of the skin by blisters, vaccination, inunction of tartar emetic, and the continued innoculation of chancrous pus, have, during the last seventeen years been employed as means of eliminating the poison at the surface of the body. The last only of these means has obtained any general adoption. After extensive trial its use has declined in France, where it was first suggested by Auzias Turenne, in Germany, and lastly in Italy, where Sperino has abandoned it for mercury. In Christiania, syphilisation is still practised by Boeck, whose disciple, Bidenkap, has published tables of the patients submitted to this plan. For comparison 140 of these cases, where three years at least had elapsed between the last record of their health and the date of publication, are taken. In 40 of them the disease lasted over six months; in 24 of these the duration was less than twelve months; in five between three and five years. These results are compared with those obtained by tartar emetic inunction. A similar series of 140 cases give 59 of the disease lasting over six months; 31 being under twelve months; 20 between one and three years; and 8 between three and five years. The difference of duration under the two methods being probably due to the different conditions in which the patients are placed while treatment is being carried on. The innoculated patients being kept continuously in hospital, well fed, and given tonics, &c., if necessary. The "tartarised" patients were often purged, and sweated as well, and were discharged from hospital as soon as a temporary cessation of symptoms appeared—to be readmitted if a fresh eruption took place.

The conclusions the author of the paper drew were, first, that as all the non-mercuric methods of treatment had fallen into disrepute, recovery during their use must be attributed not to their efficacy but to natural circumstances since it has been abundantly shewn that syphilis will often subside of itself without any treatment at all. On the other hand the regular reversion to mercury after any new system of non-mercurial treatment had had its day, is strong proof of the value of the drug in the treatment of the disease.

EXCESSIVE INFANT MORTALITY.

Mr. CURGENVEN, in opening the debate, drew the attention of the Society to the rates of mortality of children under five years of age, with a view of showing that where the rate was in excess, causes were operating that might, to a certain extent, be removed. The death-rate under that age was, for England, 27 per cent.; upper and middle classes 11 to 14; agricultural districts, 20; manufacturing districts (men, in average or excess), 30 to 35; (women in excess), 40 to 56; London, 32; Liverpool, 45·5; Illegitimate, 60 to 90 per cent. In France, in country districts, 18 to 20; nurse children, 60 to 90 per cent. Foundling hospital, on the Continent, 45 to 75; Grey Nun's, Montreal, 80; Infant's Home, London, 68 per cent.

The excess of deaths to which he desired to direct attention was that above 20 per cent., which is the normal rate in agricultural districts.

The principle causes operating in the destruction of infant life, he considered, were, first, overcrowding in the dwellings of the poorer classes, resulting in a want of light, air, and cleanliness, three essentials to the health of an infant. The effects of overcrowding were particularly noticeable in large towns, for without light and fresh air the infant languishes and dies, as does the young plant. Badly ventilated rooms, and ill-drained houses, are fruitful sources of diarrhœa, convulsions, and other diseases. It is officially reported that in the overcrowded districts of Liverpool, during July, August, and September last, 91·6 per cent. of all the deaths from diarrhœa occurred in children under two years of age. Nothing but

stringent legislative and sanitary measures will check overcrowding. It occurs in the agricultural labourer's cottage as in the crowded parts of large towns, and is independent altogether from the question of over-population, so much dwelt upon by certain political economists.

Secondly, ignorance, carelessness, and neglect on the part of mothers and nurses, lead to a vast amount of mortality among infants. Ignorance, with respect to the clothing and ailments of infants; ignorance in the choice of suitable food, in its preparation and administration; carelessness and neglect in the regularity of feeding, in cleanliness, fresh air, and suitable exercise; the absence of mothers at work, the consequent neglect of their children, and the pernicious use of opium; these causes lead to a great amount of mortality from dietic diseases. The neglect of illegitimates, and children entered in burial clubs, swelled their death-rate up to 60 per cent. and above.

Thirdly, the congregation of hand-fed infants in institutions was most fatal, for in spite of the greatest care 4 out of 5 will die. The principle cause of their death was thrush, followed by diarrhœa and atrophy. In one institution in London 60 out of 68 deaths are recorded as occurring from atrophy alone.

The causes enumerated lead to *dietetic* diseases—thrush, diarrhœa, atrophy, debility, and convulsions. He included the latter, because *dietetic* complaints frequently terminated in convulsions, and thus it became the registered cause of death. In 1864, no less than 67,888 deaths, or 63 per cent. of all the deaths under 5 years of age occurred from these diseases.

The preventive measures by which this excessive mortality may be checked, are not to be found in any particular views in respect to diet or medicine, however important these may be as accessories. The evil lies deep in the social and moral condition of the poorer classes. Let the overcrowding be checked, and the children of the poor educated, compulsorily if necessary; then, with less of the present impenetrable ignorance and prejudice, and with more light, air, and cleanliness in their dwellings, medical men and sanitarians will have more chance of observing good results from their teachings; and the poor people themselves will take more interest in the care of their children, and in keeping their homes healthy. Let them, then, be instructed in the laws of health, and in the correct method of rearing their children. Teach them that the child requires food suited to its age, and that the farther they depart from its natural food, the less likely is it to thrive and live; then may we hope to see the death-rate of infants reduced to a lower figure than that at which it stands at present.

Correspondence.

THE COLLEGE OF PHYSICIANS OF LONDON.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your correspondent, "A Fellow," seems highly indignant that *Licentiates* of the College of Physicians of London, are "spreading themselves over the country," and setting themselves up as the professional equals of the Members, and (or, perhaps, more strictly speaking, of his own order), the Fellows of the Colleges. Have not *all* the Licentiates been examined and found fit to practise as Physicians? Were not many mere German and other foreign diplomas *(together with the requisite number of guineas)* deemed sufficient to obtain the Membership without any examination? And is not the Fellowship well known to be, as stated by another correspondent, confined to the "few personal friends of the self-elected Council?"

If "A Fellow" can give no satisfactory answer to these queries, the Licence is *not* equal to the Membership or Fellowship, but evidently the most truly respectable qualification granted by the College.—Yours respectfully,

ANTI-HUMBUG.

A LADY DOCTOR'S SUGGESTION ON PREVENTION OF VENEREAL DISEASE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I noticed E. L's letter on the above subject in your impression of June 26th, and while convinced that the view therein expressed of the effect of a medical examination is a correct one, that it would be a plan fraught with much evil, and that nothing would so greatly tend to the complete degradation of these poor women as this exposé. I am also obliged to admit that the resolution of the Harveian Society's Committee, "that such women should be required to submit themselves to a periodical examination, &c. &c.," was a just and good resolution.

It occurs to me, that if this examination were conducted by medical ladies instead of medical gentlemen, the objection would no longer have force, the end desired by the Committee would be gained, and the poor unfortunates would not feel themselves further degraded.

Moreover, the ladies would be interested in the moral reclamation as well as in the physical well-being of their unhappy patients, so that, instead of the "Society for the Rescue of Young Women" being able to report that about 1000 of these outcasts are yearly reformed, I am persuaded the number would be largely increased.

There are certain ladies who for sometime have been studying medicine, and who are competent to undertake this work, ought it not, therefore, to be entrusted to them.—I remain, sir, yours obediently,

MARIA FIRTH.

SEA-SICKNESS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Observing that Dr. Chapman has offered to supply spinal ice-bags to the Medical men about to cross the Irish Channel, for the purpose of being present at the meeting of the British Medical Association in Dublin, to test the value of his principle for removing sea-sickness, permit me to ask some of our Medical friends to test my plan also. It is simply, when nausea sets in, to take occasional sips of cold ice-water, and recline in a semi-horizontal position immediately after for half-an-hour or so, particularly near the centre of the vessel, if possible, but not too near the engine-room. Lately returning by the night-steamer from Calais to Dover, and being an old voyager and sailor, I had an opportunity of rendering good advice to many of the lady passengers, to enable them to avoid sea-sickness. The passage across was very rough, and the vessel rolled about like a turtle—so much so, that I had all my work to do to steady myself on my sea-legs, for the object of administering relief to the over-fed Exhibition passengers. Now, sir, I obtained from the steward constant glasses of cold—very cold—water, made several ladies partake of it occasionally, and recline on deck as directed. The result was the complete removal of a disposition to sea-sickness, and a disposition to be merry than otherwise—a few encouraging words helping this. This plan of mine, perhaps known to others, I have adopted for years past. Let our Medical friends adopt it, and try it *versus* spine-bags. One condition I would suggest—not to overload the stomach before starting.—Yours truly,

M.D.

P.S.—All the treatment in the world, from my experience, will not remove the peculiar feeling of landsmen—*i.e.*, the motion of the vessel—except an apprenticeship to the sea.

Gleanings.

BARON LIEBIG.—At the national banquet of chemists at Paris, Baron Liebig, whose health was proposed by M. Balard, proposed the memory of Gay-Lussac, and Thénard, and gave some pleasing reminiscences of his early connexion with these great chemists. He said he should never forget the hours spent with Gay-Lussac. When they had finished a good analysis, he (Gay-Lussac), used to say—"Now you must have a dance with me, as I used to dance with M. Thénard when we had found something good;" and then they danced and rejoiced over their recovery. While admiring this simplicity of nature, we are led to ask whether our English chemists are wont to follow Gay-Lussac's example.—*London Review.*

LONDON WATER SUPPLY.—The late Water Commission recommended the companies to supply London with water continuously. This suggestion is of great importance, and we hope to see it carried out. Much of the disease now epidemic in the poorer districts of London would be prevented by a constant water-supply. There is, however, another

reason, which a circumstance referred to in one of the Registrar-General's late reports supports fully, and that is, the prevention of the entrance of sewage into the water-pipes. If the water was always "on," it would be almost impossible, in the event of injury to the pipe, for sewage matter to enter it; but, owing to the pipes being occasionally empty, sewage sometimes finds its way into them. An instance of this occurred quite recently in Portland-street. The water-pipe being damaged, the sewage matter entered it, and was found in the water in the proportion of more than one per cent.—*London Review.*

VITAL STATISTICS OF SCOTLAND.—The Registrar-General has now completed ten years' detailed reports of births, marriages, and deaths in Scotland—a period generally regarded as sufficient for obtaining a fair average; and we have now, therefore, the means of ascertaining the vital statistics of the country more accurately than at any time since Scotland has been a nation. The annual birth-rate in the ten years 1855-64 has averaged 3·447 per cent.; the marriage rate, 0·689 per cent.; the death-rate, 2·135 per cent. The death-rate in England in the same period was 2·216 per cent. The lower mortality in Scotland is due, partly, at all events, to its smaller proportion of large towns. The annual death-rate in Glasgow in the ten years averaged 3·01 per cent. In every quinquennial period of life the rate of mortality is heaviest among males with one exception. Between 10 and 15 the female death-rate in Scotland in the ten years slightly preponderated over that of males. 0·1 per cent. of all the children born were illegitimate. In the same period the registers show only 6·4 per cent. illegitimate in England, but a considerable number of births escape registration in England (nearly 37,000 a year, according to the Census report), and as a majority of these probably belong to the illegitimate class, it may be assumed that the proportion of illegitimate children at birth is nearly the same in both countries. Owing to the Scotch law of legitimization by subsequent marriage of the parents fewer persons in the population are illegitimate in Scotland than in England. The ten years' returns show some progress of education in Scotland. In the five years 1855-59, 88·2 per cent. of the men who married and 76·5 per cent. of the women were able to sign their names in the parish register; in the five years 1860-64, 89·3 per cent. of the men, and 78·1 per cent. of the women. These numbers are much above those of England. Arraying mortal diseases in the order of there fatality in Scotland, we must place first consumption, which in the ten years upon an average destroyed 2·595 per 1000 of the population every year. It looks well that old age comes next, 2·119 per 1000 dying annually from this cause, without marked signs of disease. Then comes bronchitis, taking off its 1·525 per 1000 per annum; typhus or continued fever, 1·018; premature debility, 0·985; scarlatina, 0·920; heart disease, 0·789; pneumonia, 0·730; whooping-cough, 0·725; hydrocephalus, 0·626. These are the ten most usual modes of exit from life in Scotland. Next in order, according to the returns for the last two years of the series, would come diphtheria, which, until 1857, did not appear in the Scottish bills of mortality at all.—*Times.*

CÆSARIAN OPERATION WITH SUCCESSFUL ISSUE.—Dr. Poupart of Ypres, laid the particulars of this case before the Belgian Academy of Medicine. The subject of it, twenty-four years of age, and of small stature, had been delivered two years since of an infant somewhat before its full time with great difficulty, on account of the narrowness of the pelvis. Recommended, in case of another pregnancy occuring, to apply in time to have premature labour brought on, she neglected doing so, and Dr Poupart only saw her after labour had actively set in with a full-timed infant. The forceps had been attempted to be applied in vain, and a portion of the small intestine descended through an aperture in the vagina as low as the vulva. There was also retention of urine, catheterism having been rendered impossible by the pressure of the head against the symphysis pubis. The Cæsarian operation was performed, and a living child removed. The bladder was evacuated, and the placenta presented itself at the mouth of the wound, the uterus immediately contracting. The protruded intestine was returned and covered with the omentum. The woman continued in a state of great prostration for many hours, but then rallied, and plenty of milk was secreted. The wound healed very promptly, the ligatures being all removed by the seventh day. The utero-vaginal rupture also readily healed. Measured by Van Hoevel's pelvimeter, the antero-posterior diameter was found to be but six centimetres, or three centimetres less than the biparietal diameter of the child's head.—*Presse Belge*, July 21.

FELLOWSHIP EXAMINATIONS.—The Council of the Royal College of Surgeons of England has just issued the new regulations respecting the Professional examinations for its Fellowship, from which it appears that in future those candidates undergoing the ordeal will have to submit to a *viva voce* as well as a written examination; that in the first examination junior candidates will not be required, as heretofore, to dissect, but that all candidates, whether seniors or juniors, will be examined *viva voce* on dissections and preparations; and that the second examination will include the practical use of surgical apparatus. The next examination under these new regulations will take place about the middle of November.—*Medical Times and Gazette.*

MR. FITZGIBBON, hospital apprentice, got the Victoria Cross for his conduct at the Taku Forts. Surgeon Ross claims the same honour on these grounds:—On the same occasion he went out under fire to attend a wounded dooly-bearer, and, while doing so, was re-called to attend one of the regiment to which he belonged. He sent, therefore, an hospital apprentice to attend the dooly-bearer. When the storming party advanced, Mr. Ross went with it, and was engaged in binding up Colonel Thomas's wound when the same hospital apprentice, who was close at hand attending to a wounded man, was shot, and was at once aided by Mr. Ross, who set his arm. The hospital apprentice was Mr. Fitzgibbon, and it was for the acts we have mentioned the Victoria Cross was conferred upon him. Mr. Ross, who further went on to the breach and mounted it, is now refused the Victoria Cross, on the ground, we believe, that he did not apply soon enough; but on this statement of facts we do not think he has been treated with fairness.—*Army and Navy Gazette.*

Medical News.

CONFERRING OF KNIGHTHOOD ON MR. HENRY THOMPSON.—We learn with great satisfaction that her Majesty the Queen has been pleased to confer the honour of Knighthood on Mr. Henry Thompson, of University College, London, Surgeon to his Majesty the King of the Belgians, at an audience at which her Majesty received Mr. Thompson, at Osborne, on Saturday last. The announcement of this event will be received with pleasure in the Assembly of the British Medical Association, in Dublin, where Mr. Thompson now is, as the guest of Dr. Fleming.

THE Annual Meeting of the Metropolitan Poor-law Officers' Association, was held at the Free-masons' Tavern. After the reading of the quarterly report by the hon. secretary, resolutions were passed condemning the system of taking lunatic paupers into police courts for certification as to their insanity by police magistrates, before removal to an asylum. A memorial to the Lunacy Commissioners and the Poor-law Board on this question, was also submitted, together with suggestions for establishing more intimate relations between Poor-law Medical Officers and Medical Officers of Health.

THE Registrar of Magherafelt, in the north-eastern part of Ireland, records the death of a man, aged eighty-five years, from congestion of the lungs, who had carried for forty years an immense sarcomatous tumour growing from the side of his neck. The weight of this excrescence was computed by several medical men at from thirty to fifty pounds; it lay pendulous ever the front of the right side of the chest and arm, and at times "he turned it back under his head, and made a pillow of it."

ROYAL COLLEGE OF SURGEONS, LONDON.—The following gentlemen, having undergone the necessary examinations, received their diplomas in dental surgery at a meeting of the Board on the 31st ult.—viz., Benjamin Wright Freeman, Burwood-place, Hyde-park; Samuel Kearsley Thompson, Highgate, Kendal; Henry John Hooper, Tolmer's-square, Hampstead-road; and Henry Moon, M.R.C.S., Camden-road, Camden-town. (N.B.—All earlier-dated pass-lists of this College have already appeared.)

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.—At a meeting of the President and Fellows held on Tuesday the 30th of July, the following gentlemen, members of the British Medical Association, were duly elected Honorary Fellows of the College:—Dr. A. P. Stewart, Dr. Hughes Bennett, Dr. Waters, of Chester; Dr. Falconer, of Bath; Mr. Jacob Lockhart Clarke, Dr. Markham, Dr. Gream, Mr. Spencer Wells, and Prof. Polli, of Milan. The President and Fellows distributed their honours amongst those members of the British Medical Association who had not been included in the necessarily small number on whom Honorary Degrees are to be conferred by the University of Dublin.

GIBRALTAR.—The resident population of Gibraltar, according to the last census, amounted to 15,462, exclusive of the military, the convicts, and aliens on temporary permits. From the Blue-book just out we learn that the number of births was 633, and there were 855 deaths.

THE Viceroy of Egypt has given £150 to the Royal Hospital for Incurables.

THE cattle plague has made its appearance in a district near Philippeville, in Algeria.

A DEATH from chloroform is reported as having occurred in the Beaujon Hospital, in the case of a young man under the care of M. Robert, and in whom it was necessary to perform some operation about the thigh.

LATEST FROM THE MAURITIUS.—A correspondent, who dates his letter June 18th, says:—"The fever is diminishing, the deaths having fallen at Port Louis from the *maximum* 230 to 50 a day; but fears are now felt that the fever may become endemic. It has not decreased on the advent of the cold weather to the extent anticipated. Things have been very bad here, and for two or three months the loss of colonial revenue was about one-half, or £1000 per day.

A SURGEON of some note has presented to the French Society for the Protection of Animals, a memoir in which he argues that the suppression of vivisection will not only be attended with bad consequences to animals, but will lead to serious compromising of the public good; that vivisections are necessary to the successful cultivation of the healing art, and that the public are not fit judges of the question. What will the Society for the Prevention of Cruelty to Animals say to this extraordinary assertion?

NOTICES TO CORRESPONDENTS.

Contributions should be *legibly* written, and only on one side of the paper.

When proofs are forwarded it is of the utmost importance that they should be corrected and returned without delay.

All Contributions are attentively considered, and unaccepted MSS. are returned on receipt of stamps for postage; but the Editors cannot be responsible for any accidental loss, nor can MSS. or replies be delivered on personal application.

A full and concise report of the proceedings of the British Medical Association in Dublin, with abstracts of the papers read, which are most likely to be of interest to our readers, will be published in our next week's issue. Those gentlemen who wish their papers to appear in the Journal *in extenso*, will please forward same to the Office for approval at their earliest convenience.

We are again compelled to hold over some valuable contributions for want of space; our contributors will kindly extend to us their indulgence. Amongst them are papers on Febris Nigra, Obstetrics, Fever, its Real Nature and Treatment, &c. &c.

W. L.—The injection of the liquor carbonis detergens in a case of gleet is two drachms to eight ounces of water three times a day. The immediate effect is an increase with subsequent cure.

Anodyne.—1. You have mistaken the dose. Nepenthe is uniformly of the same strength as tincture of opium, and is said not to cause headache or constipation. 2. The tremulous iris, which you describe, is a symptom of "disorganisation," and therefore a contra-indication of operation.

Censor.—We should consider ourselves editorially responsible for opinions contained in unsigned letters. We cannot accept facts except under the authentication of your name.

Tourist.—You need no introduction at the Paris hospitals. "The Guide des Etudiants" will give you the hours of attendance of the medical officers. Generally from eleven to one o'clock, and you can walk through the wards with them with perfect freedom.

Dr. Garland, Newry.—The omission of which you complain was inadvertent. We regret that it cannot now be remedied.

X. Y. Z.—There is no agent in Dublin. Those elsewhere are seldom reliable, and the matter can be much more satisfactorily negotiated through the owners themselves. There being much demand for the appointments they are with difficulty secured. Write to various shipping firms specifying your qualifications and testimonials.

POOR-LAW MEDICAL VACANCIES.

Finsbury Dispensary.—Resident Medical Officer; salary, £120.

St. George's and St. James's Dispensary.—Apothecary; salary £100, with residence.

Ardee Union.—Callon Dispensary District; salary £80.

Belmullet Union.—Salary, £100.

Letterkenny Union.—Churchill Dispensary; salary, £100.

Rathdrum Union.—Arklow Dispensary District; salary, £80

Alcester Union.—Inkberrow District; salary, £60 per annum.

Newark Union.—Foston District; salary, £14 per annum.

Ongar Union—Second District; salary, £55 per annum.

MEDICAL APPOINTMENTS.

ENGLISH.

BASAN, HORACE, L.R.C.P.Ed., L.F.P.S.G., L.S.A., has been appointed Resident Medical Officer of St. Marylebone General Dispensary.

COLBORNE, W. H., M.D., has been appointed Medical Officer and Public Vaccinator for the Sutton Benger District of the Chippenham Union, Wilts, vice H. Ryley, L.R.C.P.Ed., resigned.

DILLON, Mr. W. E., has been appointed Assistant-Surgeon to H.M.S. Cumberland.

GRIFFITH. Dr. G. DE GORREQUER, Physician to the Hospital for Women and Children, and Physician-Accoucheur to St. Saviour's Maternity, has been elected Medical Officer to the Civil Service Association, London.

MOSS, Mr. B., has been appointed one of the Medical Officers for the West Ham District of the West Ham Union, Essex.

PARSONS, W. A., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for the Tamworth District of the Solihull Union, Warwickshire, vice Kimbell, resigned.

ROBINSON, C. A., M.R.C.S., has been appointed House-Surgeon to the Hospital for Women, Soho-square.

SHEPHEARD, P. C., M.R.C.S.E., has been appointed Medical Officer for the 1st South-Eastern District of the Freebridge, Lynn Union.

IRISH.

MULLINS, Dr. E. A., has been appointed second Medical Officer for the Achill Dispensary District of the Newport Union, Co. Mayo.

PARKE, W., L.R.C.P.Ed., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Gortin Dispensary District of the Gortin Union, Co. Tyrone. Medical Officer to the Workhouse, and to the Gortin Constabulary, vice Wm. Leatham, L.R.C.S.I., resigned, and appointed to the Coal Island Dispensary District of the Dungannon Union.

PHIPPS, R. B, L.R.C.P.Ed., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Robertstown and Kilmeague Dispensary District of the Naas Union, Co. Kildare.

Births, Marriages, and Deaths.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

JOHNSTON.—On the 11th ult., at Hawkshead, Lancashire, the wife of Dr. A. Johnston, of a son.

JONES.—On the 14th ult., at Upper Gornal, the wife of A. Jones, M.R.C.S.E., of a son.

TURNER.—On the 20th ult., at Woodside, Upper Norwood, the wife of J. S. Turner, M.R.C.S.E., of a daughter.

CARTER.—On the 21st ult., at Clarence-terrace, Leamington, the wife of T. A. Carter, M.D., of a daughter.

TAYLOR.—On the 24th ult., at Freshwater, Isle of Wight, the wife of H. Taylor, M.D., of a daughter.

MADGE.—On the 25th ult., at Fitzroy-square, the wife of H. M. Madge, M.D., of a daughter.

MIDDLETON.—On the 31st ult., at the Royal Hospital, Greenwich, the wife of Dr. James Middleton, R.N., of a daughter.

MARRIAGES.

SLOPER—GWYNNE.—On the 11th ult., at St. Mary's Church, Abergavenny, Charles Edward Sloper, L.R.C.P.Ed., of Poplar House, Tredegar, to Mrs. Elizabeth Gwynne, of Monk-street, Abergavenny.

WILLETT—BURROWS.—On the 23rd ult., at All Souls' Church, St. Marylebone, Alfred Willett, F.R.C.S.E., of Wimpole-street, to Rose Ellen, daughter of Geo. Burrows, M.D.

MORRIS—BOTTELEY.—On the 25th ult., at St. James's, West Bromwich, Pryce Jones Langford Morris, Esq., of Osbournby, Lincolnshire, eldest son of the late Pryce Morris, Esq., of Oswestry, Salop, to Isabella Frances, youngest daughter of the late Thomas Botteley, Esq., of Black-lake House, West Bromwich, Staffordshire.

DEATHS.

CRIDGE.—On the 2nd of May, at Grafton, New South Wales, E. M. Cridge, M.R.C.S.E., aged 35.

BENBOW.—On the 2nd of June, at Fort Beaufort, Cape of Good Hope, John Benbow, M.D., L.R.C.S., F.R.C.S.Ed., Surgeon of the District, and formerly of the Army Medical Staff, aged 46.

COTES.—On the 20th ult., Mall House, Hammersmith, Henry Cotes, F.R.C.S.E., late of the Bombay Medical Service, aged 51.

SHEKLETON.—On the 26th ult., at Upper Leeson-street, Dublin, Dr. Robert Shekleton, Surgeon half-pay 51st Regiment, aged 78.

STEPHENSON.—On the 29th ult., at Manchester, John Stephenson, M.D.

Addresses.

AN ADDRESS IN MEDICINE

DELIVERED BEFORE THE

BRITISH MEDICAL ASSOCIATION,

ON WEDNESDAY, AUGUST 7.

By Sir DOMINIC J. CORRIGAN, Bart., M.D.

MR. PRESIDENT AND GENTLEMEN—The President of this great Association has already welcomed you to Ireland. Let me—feebly, perhaps, but with all my heart—echo that welcome on this the first occasion of our meeting. My next duty is to thank you for the distinction you have conferred upon myself in requesting me to deliver the address of this day—a distinction that would be a high one were it conferred by my own College, high if conferred by the Profession of my own country, but that now comes to me as a triple honour when presented to me by the Profession of the United Kingdom. And among the bonds that unite the three divisions of our kingdom together, there are none stronger than those of our Profession, soaring in its exercise above all sectarian discords. We know no difference of race, or creed, or colour—for every man is our neighbour; and when we remember that the Redeemer, while on earth, chose the healing of the sick as one of the most impressive evidences of His divine mission, we must ever hold in respect the exercise of a Profession that devotes its efforts to the same object. Inscribed on the walls of our old—and I hope soon to see it in our new—College-hall, still stands the motto to remind us of this—

ΠΑΡ ΥΨΙΣΤΟΥ ΕΣΤΙΝ ΙΑΣΙΣ.

Perhaps the greatest, truest, and most convincing tribute that can be paid to the worth of the Profession of Medicine is, that when members of our Profession have spent a long life in its exercise; when on their death-beds; when the past is as a dream, the present a flitting moment, the future an awful eternity, they have thought that the best use they could make of their wealth was to leave it to hospitals and schools of medicine, where the Profession they had so long followed would continue to be taught and to be practised. In our own city we have only to look around us to see examples of this. "The elevation of the social position of the Profession," I have chosen as the subject of my present address. The social position of the Profession, and the estimation with which its members are to be regarded by the well-informed of society with whom they are associated, depend on the good general education and professional skill evinced by them. To some points in forthcoming legislation I shall now take the liberty of asking your attention. I am greatly strengthened in taking this line by the observations of our President yesterday, in his opening address, received by you with acclamation, when, with that emphatic philosophic earnestness peculiarly his own, he declared his conviction that the general education of young men going into our profession should not be inferior to that of the kindred professions—the Church and the Bar. It is now, almost to a day, nine years since the Medical Act received the Royal assent, and I cannot say—and I believe many will unite with me in thinking—that the results have been such as to satisfy us either as to the education or protection of the profession. Has the standard of general education been raised? I fear the answer must be in the negative. For a period varying from one to two hundred years, or more, their respective foundations, the University of Dublin, the King and Queen's College of Physicians in Ireland, the Royal College of Surgeons in Ireland, and the Apothecaries' Hall of Ireland, required a knowledge of Greek as a necessary part of the examination of candidates for their respective degrees or licenses. And I think there is not a man who knows anything of the nature of our studies that will not say Greek should be a component in the education of every member of our profession. Yet one of the first acts of the Medical Council under the Medical Act was to declare that a knowledge of Greek was not necessary, and it was only after a long contest I succeeded, as a compromise, in getting a resolution passed that it should be required after 1869. In the proceedings of the council of this year it has been further resolved that botany be also excluded from the list of subjects for examination. It is idle to say that this only refers to a minimum of education; a minimum thus put forward is a sufficiency, and will be regarded as such by students and licensing bodies. The tendency thus appears to be to bring down education to a lower level, not to raise it to a higher. The preliminary education, moreover, of our students in general education, instead of being revised by any one responsible body, is left almost to chance, for no less than eighteen bodies have the power of examining in arts and science students going to the medical profession, and giving certificates, some in the United Kingdom, some in Tasmania, and some in Canada. I think it must be self-evident to every practical mind that such a system can never be depended on to ensure an adequate preliminary education. The several licensing bodies have no means whatever of knowing how those preliminary examinations have been conducted, nor often even the subject of examination. They may change from year to year. Indeed, it was only after some time it was discovered that some of the bodies whose certificates of preliminary examination were recognised, did not make Latin a necessary part of the examination. It is stated in report of committee in minutes of General Medical Council of June 5, 1867, "that the visitors of examination give in most cases a satisfactory report of the manner in which the examinations in general education are conducted." But if we look at the report from the Navy Board to Council of the examination of candidates for direct commissions, we find such observations as these on the education. Opposite the number of one candidate is this observation—"Utterly failed in preliminary examination." Opposite the number of another—"failed in classical examination, declined to attempt to translate and failed to write a prescription." Nor must these be viewed as isolated instances. Each candidate rejected for ignorance represents a group of others equally ignorant and incompetent who have passed some of our licensing bodies, are now on the Registry as "duly qualified practitioners," and probably in possession of appointments through the country, bringing on themselves and the profession the contempt of all well educated persons with whom they are brought into relation in social life, and practising medicine to the hazard and, probably, the loss of human lives. The course which has been adopted of deputing to other bodies far asunder and irresponsible the examination of young men destined for our profession is a great anomaly. The Horse Guards and Admiralty do not recognise certificates of education from other bodies. They know what they want, and they have their own examinations to test it. The civil service examines for itself, but any examination by almost any one, and anywhere, is to be deemed sufficient for us. There is no entrusting here to peripatetic and irresponsible bodies scattered over the world the examination of young men going to the profession of solicitor. Can we hesitate for a moment in coming to the conclusion that for students entering the study of medicine there should be one uniform and sufficient preliminary examination, and that such examination should be under the control of a central authority in each division of the United Kingdom, defining what is wanted, and what the examination should be. We began with nine; we have now arrived at eighteen, including the reception of certificates from Canada to Tasmania. The list is increasing yearly, and the greater the number necessarily the lower the standard. The Navy Board examines for itself. The Civil Service examines for itself. The several universities examine for themselves. There is no parallel instance that I know of similar to our system of taking certificates from almost every body, and the result is seen in the lamentable results shown forth in the army

and navy returns of rejections, where we find candidates rejected for ignorance of the simplest branches of preliminary education. It appears to me to be worse than useless to proceed still in this way. It is evident that under the present system young men get into our Profession who could not pass an examination for the place of a letter-carrier. What is to be done to remedy this sad state of things? Two courses occur to me—one would be to require that every young man, before he gets his degree, should have passed through a university course in arts. This, I fear, would be found impracticable, however desirable. The other is, that in each division of the United Kingdom there should be a Board of Examiners, and that all young men, except those going through a course of arts or science in a university, should be obliged to have undergone an examination in general education before such Board either before the commencement of professional education or within the first two years of medical study. This second plan would, I believe, be practicable. The principles on which I have ventured to deal with the subject of general education and examination apply similarly to the other great division, that of professional education. The same evils exist. We have in the United Kingdom nineteen licensing bodies conferring no less than thirty separate licenses and fifty-three titles. The result is necessarily a downward tendency in competition. Wherever there is a great number of universities or licensing bodies, the competition must be downwards. It is notorious that students know as well in regard to their diplomas, as buyers do in regard to other articles of purchase, where they will get what they want on the easiest terms. They go there and become the possessors of what they want—diplomas—it matters not good or bad articles, for the legal brand, in the form of a registry, declares under Act of Parliament that all are equal. The sad state of ignorance engendered by this downward competition has obliged the Army and Naval authorities to examine for themselves; for they cannot place reliance on the diplomas of our numerous licensing bodies, and could not, on the faith of diplomas issued by them, entrust to their holders the lives of our soldiers and sailors. It appears to me that if our system be not altered, the civil authorities of the country must ignore all our licensing bodies, and, like the Army and Navy authorities, institute an examination for themselves. I should deeply regret to see this, but to this, I fear, it must come unless we bestir ourselves. The General Medical Council has seen the evils I have pointed out, and has attempted to deal with them in two ways, both, I fear, ineffectual—the one is, by issuing "recommendations," or, as they are sometimes erroneously called, "regulations" as to education and examination; the other by "visitations of examination." I will glance briefly at both. "Recommendations," as they are termed, are useless. No one can be tried or punished for disregarding a "recommendation." A recommendation is merely an expression of approval; it is not an "order" or "regulation." The issuing of "recommendations" being thus a failure, another step has been taken which is called "The Visitation of Examination," both preliminary and professional, undertaken in order to ensure that examinations are sufficiently strict. The visitation of preliminary examinations is simply impossible, as the "preliminary examinations" may be held at uncertain times, and in all parts of the United Kingdom, and through our colonies, from America to Australia; and the visitation is supposed to be an efficient supervision over nineteen licensing bodies in the United Kingdom, thirty different diplomas, and fifty-three titles. Believing that such visitation would be only a screen to conceal defects, and not an exposure of them, I felt myself constrained from the outset not to take any part in them. I think it necessary on the present occasion to observe that visitations of examinations cannot command confidence from the radical defect that the several licensing corporations, through their representatives, report upon one another. Twenty-four members, for that is the number of the General Medical Council, either representing, or intimately connected with nineteen licensing bodies, admit that these nineteen licensing bodies are not what they ought to be—that they stand in need of inspection, and they proceed to carry it out. How? By inspecting one another. A. inspects B.'s establishment, and B. inspects A.'s, and thus round the whole twenty-four letters of the alphabet; and then they report upon one another reciprocally, as a distinguished member of the Council and of this Association has well observed, with a general interchange of courtesies. What would be thought of a report from twenty-four members of the House of Commons inspecting and reporting to themselves on the suspected purity of one another's constituents? For not taking a part in this inspection I have been denounced by a portion of the press, and in another place as an obstructor to the progress of professional improvement. There are two kinds of obstructors—one who obstructs a good measure, and another who obstructs a bad measure. But there is a third kind of "obstructor" to progress worse than either of the other two—he who pretends to be ardent in progress, but has at heart no desire for it. I believe we have among the most vehement supporters of visitations of examinations such obstructives to deal with, seeming to carry on, but secretly taking care that no progress is made, for their object is that we should remain stationary. Visitation of examinations is the sail under the lee. We must not let ourselves be blinded to admit, when a new medical bill is before the House, that the present system can ever be made efficient. In the amended bill that has been put forward by the Council there is one clause that I make no apology for bringing under your urgent attention. It is that the General Medical Council shall have a power to admit, without examination, to the registry, and thus make eligible for all appointments in the United Kingdom the holders of foreign diplomas equally with our own graduates and licentiates, on satisfactory evidence being had before it that those degrees or licences had been granted after a sufficient course of study and examination. The proposed clause will be found in the minutes of the General Medical Council of June 5th of this year. I hope the whole profession will seriously consider this proposed clause, and unite with me in resisting it, not merely for their own sake, but for the public good. It is notorious that both in Germany and in America there are universities that sell their diplomas just as they sell beer or Indian corn to all who can afford to pay for them. I have received other evidence since. A gentleman connected with the medical and literary press of London has placed a document in my hands, in which he certifies that an American agent called on him this present year with diplomas duly signed and sealed by one of the American colleges nine or ten years old; he could have a supply fifteen years old if required. He had a variety in stock, price £20, and would allow a discount off, as it was a matter of business. This gentleman is quite ready at any time to verify the memorandum and to give his name. I have within the last week received letters from two members of the Profession, one of them a president of one of our Branch Associations, in which he encloses to me a communication from an agent in Glasgow, in reply to a commution for the purchase of a foreign diploma; and I am sorry to say an M.D. of one of our universities. The letter is so characteristic that I shall make no apology for reading it at length:—

"Ewing-place, Glasgow, 24th July, 1867.

"DEAR SIR—After having had the pleasure of your note of the 6th instant, I write you in direct course. I stated in terms of my said letter that no university but that of the State of Pennsylvania gave degrees of 'Medical Doctor *in absentia*,' the cost being £32 12s., and in full of all demands and delivered free. I also stated in terms of my said note that the university of Giepen, of Hesse-Darmstadt, gave degrees of M.D. for £22 paid there, and £15 10s. sterling paid here, and also in full of all demands In either case I will cheerfully assist you or your friend in obtaining the object in view. As I

have four new degrees to get at Pennsylvania next week, and other four at Giepen also, please send me £32 12s. for the Pennsylvania degree, or £15 10s. in part of the Giepen degree, and I will send all the requisites to you in course—I am, my dear sir, truly yours, "————, M.D."

To give this epistle due dignity there is inscribed on the envelope "On her Majesty's service." It is scarcely necessary to observe that I have in my possession the documents and the names. It is further to be observed with regard to some of the German universities that the same university gives two kinds of degrees—one on a *viva voce* examination, the other *in absentia*. This is a abuse enough, but there is another ingenious subdivision of the *viva voce* examination. To any one of honest intelligence the phrase *viva voce* examination would convey that the candidate presented himself at the seat of the university, and was examined there by its authorities. Not at all, for in one of the documents in my hands the applicant, residing within this kingdom was referred for the *viva voce* examination—to whom do you suppose?—to one of their own graduates, in the neighbourhood of the applicant; and the applicant was informed that on passing such *viva voce* examination and payment of £32 he was to have the degree. It seems to me most inexplicable inconsistency on the part of the General Medical Council to institute visitations of examination over our own universities and colleges of physicians, and yet to propose to dispense with them in the case of the foreign universities, merely requiring evidence to be had before them as to the course of study and examination required. One of the most extraordinary arguments I ever heard in support of admitting foreign diplomas without examination was the introduction of the principles of free trade into debate. It seems strange to me that the advocate of this extraordinary proposition did not propose what would have been a simpler mode of extending to our Profession the principles of free trade, viz.,—by abolishing all restrictions whatever, all degrees and licences, all education and examination, until, at last, as Mr. Gladstone, in his celebrated free trade speech at Paris, said of custom-houses, all universities and colleges would be only remembered as things of the past. As to procuring evidence before recognition that such and such foreign universities had abandoned their evil ways, and instituted sufficient courses of study and examination, there would never be any difficulty in procuring such evidence. We all know that testimonials can be had as plentiful as blackberries for anything, from a South Sea bubble to Solomons' spectacles. Even if we had the most satisfactory assurances that there would not be an abuse this year, we could have no sufficient guarantee that it would not occur next year. Let foreign diplomas be once put on our register under sanction of law as proposed, and they could never be removed, so great would be the legal difficulties in the way. I believe I am not wrong in saying that the holder of a foreign diploma from a university once recognised, could apply for a mandamus, obliging the Council to show cause for such removal, and as neither foreign universities nor holders of their diplomas would voluntarily criminate themselves, and as a foreign university could not be brought into a court of law in this country, the General Medical Council would be powerless. Another argument I have heard advanced in favour of the admission of foreign diplomas is, that there was a power to place foreign diplomas on the register in the Act of 1858, and that the new claim was only continuing such a power. I cannot think this argument of any value. In accordance with the spirit and wording of every new regulating act, its restriction should not have a retrospective action. For instance, in the Apothecaries' Act of Ireland, in 1791, of England of 1815, in the charters of the College of Surgeons of Ireland, 1794, and, I believe, also in England, in 1800, it was provided that persons practising as recognised apothecaries or surgeons, at the passing of the respective acts or charters, should be legally recognised in the new act. In like manner, in the Medical Charities Act of Ireland it was provided that all persons holding dispensaries in Ireland at the time of the passing of the act, though not possessing any professional qualification whatever, should be recognised as "duly qualified," and placed on the register. But this power or right ceased, very properly, within one year after the passing of the act, and such persons could not now be registered or recognised as qualified to hold appointments. A similar power was given under the Medical Act of 1858, to protect the rights of holders of foreign diplomas then resident and practising; but it never was the intention in this act, any more than in the previous ones I have named, to continue such recognition. The protection was a mere act of grace in all the cases, and the very introduction of it with limitation, was in itself proof that it never was intended to introduce it anew. The French law is a very fair one, and it was on it I modelled my amendment of June 5 of this year, with regard to the admission of foreign diplomas at the last meeting of council. It was to this effect—That the holder of a foreign diploma desirous of being placed on the register should be entitled on such diploma to present himself for examination to some one of our licensing bodies, and on passing its examination and obtaining its diploma, to have his name placed on the register. It was urged against this that all the licensing bodies might enter into a conspiracy, like a trades' union, to deny him an examination, and I, therefore, although I thought the objection groundless, introduced an addition that in the event of licensing bodies refusing him an examination it would then be lawful for the General Medical Council to exercise their discretion in registering him. The Faculty of Medicine in France says to every foreign physician desirous of practising there, "We cannot enter into the merits of foreign universities, their shortcomings, or their sufficiencies. We will not, however, subject you, the holder of a foreign diploma, to undergo the four years of education we require from our own students, but we will require evidence that you may be trusted equally with our own physicians and surgeons with the care of life, and the only evidence we can rely upon is examination, and that you must undergo." If we in the United Kingdom go beyond this we shall let loose upon the public ignorance and imposition. It has been said that Government desired to have foreign diplomas recognised without examination. In this country the Government of to-day may not be the Government of to-morrow, and therefore the opinion of one Government may not be the opinion of another; but whatever party might be in power, I cannot think that any Government, or any Secretary of State, when made aware of the true nature of foreign diplomas, of the facts I have adduced to-day, would support the proposition of admitting foreign diplomas without examination; but were it otherwise, I believe it would be better to have no amended bill at all than a bill with such a cause. I would go further and say, better for the public to have the Medical Act of 1858 rescinded altogether and the registering abolished, leaving it as before to the public to judge for themselves of qualifications, than have those foreign diplomas legally placed beside our own. But under any circumstances let us not be parties to treat as trifles the lives of our fellow-creatures. Let not ours be the hands to fix the stamp of genuine gold on German silver or American green backs, and I am sure that in so acting we shall have the support of all well-educated Germans and Americans. I have dwelt thus long on the proposed admission of foreign diplomas, because I think the question of vital importance, and equally concerning the public and ourselves. I now come to another point which I consider of great importance in the introduction of an amended bill, and that is the constitution of the General Medical Council itself, and I think it argues much for the supineness or the good nature of the profession in the United Kingdom that they have borne with its present constitution so long. I believe we all recognize this principle in our constitution, that there should be no taxation without representation. But who pays the taxation that supports the council? You do, the whole profession that I see around me,

The bodies that send their representatives to the General Council pay not one shilling towards it. By whom are the council elected? Not by you; not one of the whole council is your member. The council are no more representatives of the profession than would the members of the House of Commons be representatives of the people if they were elected by the several corporations throughout the kingdom. If members of the House of Commons were elected in Dublin, London, and Edinburgh by the respective Lord Mayors and Corporations, they would surely not be representatives of these cities or of the people. The members of the General Medical Council, with the exception of a very small proportion nominated by the Crown, are the representatives of medical corporations, but not of the profession. These corporations keep the toll-gates through which candidates are to pass, but, except on some very rare occasions, take no further interest in the profession. In the Queen's University Convocation the graduates who have taken out degrees and are engaged in the battle of life in their several professions, are entitled to elect one-fourth of the whole number on the senate or governing body. In the London University the convocation elects half the senate, for on every second vacancy it sends forward three names out of which the Crown cannot travel. Such members are of the greatest importance, for they bring to the senate, a governing body the best of all knowledge, a knowledge of what has been done, of what is still required, and yet remains to be done. It is bringing into the senate the practical experience of the graduates from every phase of life. However estimable may be the members sent up by medical corporations as at present, however willing they are to do all in their power, they do do not draw their knowledge from a sufficiently wide field. There can be no difficulty in introducing this element of representation. The voting papers as used at present in University elections furnish the means. The registry gives the name and addresses of those entitled to vote, just as the calendar of a university gives its list of voters, and thus the members of the Profession in England, Scotland, and Ireland could each, without difficulty, elect the number of representatives allotted to each, and those representatives of the Profession, in direct communication with the whole working body of the Profession, would bring into the General Medical Council a stock and a kind of information the Council cannot command under its present constitution. I have long thought of this alteration in the construction of the Council, and it is because long thinking has strengthened the conviction of its necessity in my mind, that I have taken this opportunity of bringing it before you. I heard it said here yesterday in debate that if additional members were given to the General Medical Council the number on the Council and the expense would be too great. As to the expense, I think that should be borne by the parties who send the representatives. Let the Crown and the corporations pay for theirs. You now pay for all. As to the numbers, I quite concur in the view that the number is already too great; but instead of all members of the branch councils being also members of the General Council, let the General Council be constituted of delegates from the branch councils or faculties in universities; send delegates to constitute a central board, and the number will then be not half its present amount. I would rather not have any legislation for some time than have the patchwork legislation that has been going on. We have already had five acts passed since 1858. We are tiring the House of Commons. Let us not go forward again with another patchwork bill, but with a broad and well-considered measure. How this is to be done is the next question. Two ways present themselves. One is, that a draft of an amended bill should be drawn up, as on former occasions, and that every corporation or university, every general and branch association should press its own amendments during its progress through the House. I am not in favour of this. Votes of members would be obtained in support of this clause or that, not on its own merits, but on the influence brought to bear upon members, and members themselves might support or reject an amendment, influenced by partial representation or even by considerations of support to be obtained at some coming election. We should

"Meet again,
In thunder, lightning, and in rain—"

again stand round the cauldron with

"Double, double, toil and trouble."

Another way, and I am in favour of it, is, that a Royal Commission should issue a report upon the present state of the law in regard to medical education and qualification, and that legislation should be founded on its report. I should much prefer a Royal Commission, consisting of members of the medical profession and of men of scientific acquirements, to a select committee of the House of Commons; for the members of a Royal Commission would almost certainly be persons possessed of knowledge out of the profession, and they would have the assistance of some members of the Profession as members of it; while members of the House of Commons, appointed on a select committee, might probably possess very little, if any, knowledge whatever on the subject. However, either might answer; and the advantage of the previous step would be that we should be able to know and to consider fully the various views put forward previously to the introduction of a bill. As far as I have yet been able to bestow attention on the details, the changes I should like to see effected would be these. 1st—That the General Medical Council should be altered so far as to allow a certain proportion of its members to be representatives from the members of the Profession resident in England, in Scotland, and Ireland, each division of the United Kingdom furnishing its proportion to the Council as at present. 2nd—That this central council would perform all duties as at present, and be a court of appeal from the branch council. 3rd—That the central council should have power to lay down, subject to the approbation of the Secretary of State, a code of regulations both as to preliminary and professional examination; and that all graduates and holders of licences, degrees from our several corporate bodies, should be subject to such examination before being permitted to hold any public appointment, supported wholly or in part by public grant. I would exempt, as the regulations of the attorneys and solicitors do, graduates in arts of universities from the preliminary examination, and I would not give the central council any power to lay down any code of education. I would leave to the several licensing bodies, as at present, full privilege to suit education to the circumstances of each division of the kingdom. 4th—That the branch councils should appoint a board of examination for each division of the kingdom, and give to each candidate who passed a certificate to that effect. This would extend to the public and to the sick poor of our country the same protection against ignorance and incompetency that is at present afforded to our soldiers by the regulations of the army and navy authorities. There would then be a competition among them, not, as at present, to lower the standard of education and examination in order to sell their diplomas the more freely, but a competition among them to raise their standard, so that candidates who would afterwards have to undergo the test examination would seek the body that by affording high education and examination, insured to its graduates or licentiates the best security for passing that examination. The good effects I should hope to see from such a plan as I have sketched would be—First, the advantage to the public of having well-educated practitioners for the medical care of all classes, poor and rich. Second, the advantage to the Profession itself, by the exclusion of ignorant and incompetent persons, who now, entering into competition for public appointments with the well-informed, lower the scale of remuneration for all. Such persons would henceforward find their level in other pursuits requiring less education and less knowledge. I am not wedded to details. I see that the present state of the law is injurious to the profession and to the public. I give you the thoughts that have arisen in my mind after some years of close attention

to the working of the present laws. My views may be wrong in some particulars, or in all, but I shall be well satisfied if the observations I have made here to-day awaken your attention to the subject, for then out of it will rise a light to guide our way. For mainly to you and our own Irish Association, soon I hope to be one, I look for the intelligence and the energy to construct and carry a bill that will be a benefit both to the public and the Profession. The interests of both are, and ought ever to be, identical.

ADDRESS IN SURGERY

DELIVERED BEFORE THE

BRITISH MEDICAL ASSOCIATION,

ON THURSDAY, AUGUST 9.

By ROBERT W. SMITH, M.D.

PROFESSOR OF SURGERY IN TRINITY COLLEGE.

MR. PRESIDENT AND GENTLEMEN,—When the eye wanders over this vast assembly, collected in this noble hall, what thoughts crowd upon the mind; how the imagination is carried back to remote times. Three hundred years have rolled over, and become ingulfed in the fathomless abyss of eternity, since that proud and mighty monarch, whose queenly gaze is fixed upon us, founded this now time-honoured university. What a mighty mass of intellect has it fostered and matured; what a mighty host has it sent forth of men pre-eminent in every department of knowledge; men whose genius has shed an undying lustre upon the place of their education; men whose fervid oratory has been the ornament of the bar; whose burning eloquence has enchained listening senates; men whose works, marked by poetic elegance of language, by correctness of sentiment and maturity of judgment, have adorned the age in which they appeared. Upon this auspicious occasion, which will be marked in the history of our university *meliore lapillo*, the eye rests for the first time in the history of the university upon an assembly of the members of our profession, collected from the three kingdoms, and including representative men, the magnates in every department of surgery and medicine. This is, perhaps, a fitting moment to return my warmest thanks to the Board for the cordial and honourable reception they have given to the Association, and to the Provost in particular, for the desire he has shown to advance the object of the meeting by all means in his power. He has inaugurated his university reign by an act which the medical profession of Dublin will ever gratefully remember. It is no easy task to address such an assembly as this in a manner worthy of the occasion, and when I receive the invitation of the Council of the British Medical Association to deliver the address in surgery on the occasion of this their first visit to Dublin, though deeply sensible of the proffered honour, I felt myself, I confess, somewhat embarrassed. On the one side, there was the desire to take a prominent part in the proceedings of a learned assembly of my profession, and the hope that I might be able to bring forward something of interest—on the other, there was the conviction that the delivery of a general address, such as the majority of those heretofore pronounced at the opening meetings of this distinguished association, was as much beyond the sphere of my ability as it was unsuited to my taste. But having been officially informed that I was at liberty to adopt any course I chose, I no longer felt myself justified in declining to accede to the wishes of the Council—more especially as I felt satisfied that I would have the benefit of an indulgent audience, even though it were found that I possessed neither the pen of a ready writer nor the tongue of a fluent speaker. Perhaps, however, the calm consideration of a subject of practical importance may be found to possess a real scientific value. Before entering, however, upon the more immediate matter of my discourse, I am anxious to allude to a subject which has long been to me a source of regret. I allude to the almost systematic neglect upon the part of the junior members of the Profession of the writings of the surgeons of the past generation. It is, no doubt, true that since they wrote, surgery has made great advances both as an art and a science, though but thirty years have elapsed since a distinguished surgeon and an accomplished scholar pronounced the severe judgment that surgery, as a science, might be supposed to be buried in the icy fetters of the Arctic Pole, and that no noon-tide beam had thrown its horizontal ray across this frozen region to intimate that the night of days or of weeks may be at an end. But this Cimmerian darkness has passed away. "The stream of knowledge, which," as the eloquent Graves has expressed it, "not many centuries ago, shallow and narrow, toiled painfully to wear away or avoid the obstacles that impeded its course, now, fed from a thousand new sources, flow, along deep and rapid, sweeping away every obstructions and defying all human opposition." What was formerly the termination of a science is now but its commencement; what was formerly deemed unattainable is now elementary; so that it is impossible to forsee how far improvements may be carried. A short and transitory existence has been allotted to our bodies; individuals die and generations pass away, but the common intellect of mankind fears not the same fate nor shares the same brief mortality. In modern times surgery has advanced in some departments with giant strides, and in all its progress has been steady and uniform. Ovariotomy has become an established practice. Sub-periosteal resection has opened up a new field in the demesne of conservative surgery. The crushing of the stone has gone far to supersede lithotomy. Pressure has almost supplanted the ligature in the treatment of aneurism. Acupressure has divested hæmorrhage of its terrors. The endoscope, the laryngoscope, the ophthalmoscope have each and all shed the brightness of their beams upon the obscurest diseases, and illuminated their darkest depths and their inmost recesses with their lustrous light. The calculus lies exposed—the stricture is patent in the darkest canals. The polypus in vain tries to hide itself in the ventricle of the larynx. The delicate thread worm fruitlessly coils itself in the deepest corner of the eye. But all this affords no justification for the neglect of the writings of our forefathers, so prevalent in the present age. From my long experience as a teacher and as an examiner, I have no hesitation in saying that not one student in fifty—perhaps not one in a hundred—ever reads the classic writings of Pott, of Huj, of Abernethy, Bell, Munro, Dease, Colter, and a crowd of other minds who have stamped their fame upon the pages of the history of surgery as indelibly as those of Raw, of Glarn, of Lœmming, of Cotunners, Fraltopius, Eustachius—that glorious band of anatomists—are engraven on the temporal bone, a monument which, *ære perennius*, will last as long as a human being exists on the earth, as long as the world endureth. If the description given by the great men to whom I have alluded were either incorrect or insufficient, I could understand their works being cast aside. But is this so? Has anything been added to our knowledge of Potts' fracture, of Potts' gangrene, of Potts' calculus? Do we know anything more of Huj's luxation—of Huj's internal derangement of the knee-joint? I do not think so. Independent of the valuable information they contain, the works of the authors of the past generation further repay the reader by the correctness of their style, by the terseness and succinctness, and, at the same time, the fulness and clearness of their descriptions. There is no inflated language, no giving to self an undue prominence, no magnifying of trifles, no appropriation of merit that might not be justly claimed. They wrote with a pure object—the advancement of science and the benefit of mankind. There is still another important feature of their works—they are the result of large and long experience. There was no hurrying into print with some ephemeral production—no rushing into authorship in the hope that experience would follow—no premature publication of cases that had not terminated, of operations whose final result was not known. I cannot,

therefore, but deeply regret that it has become so little the fashion, particularly among students, to study these authors, and it is much to be lamented that the system of private instruction has so completely taken the place of almost every other source of information. It may, perhaps, be thought out of place to make any allusion to students upon such an occasion as this, and before such an assembly, but the members of the Association should recollect that a large proportion of them are lecturers or clinical teachers, and that their influence is considerable in guiding the studies of those entrusted to their care. How truly has it been said that the British clinical teacher occupies a post of heavy responsibility; he is an instrument for good or evil that it is fearful to contemplate; he exercises an influence without parallel in importance and extent. Were I to carry my hearers back to more remote ages, I think it would be found that the neglect of the works of the ancients was almost universal, and yet they abound in precepts that modern science has failed to set aside. Time would fail me were I to enumerate all the instances of modes of treatment, operations, &c., which are to be found in the works of the ancient authors, and which have of late years been brought under the notice of the Profession, clothed in all the glittering charms of novelty. I shall content myself with one example, and it is a most remarkable one. The arresting of hæmorrhage by acupressure has been described by Johannes de Vigo, a distinguished surgeon of Genoa, who lived in the 17th century. He was a man of great erudition, and divided with Capri, of Bologna, the merit of being the first to use mercury for the cure of the venereal disease. He says it was the practice of some to tie the veins and arteries, when opened, with a needle and thread. "Modus autem ligationis: eam aliqui efficiunt intromettendo acum sub vena desuper filum stringendo." Is not this the third mode of acupressure of Sir James Simpson? This, however, does not in the slightest degree detract from the merit of the distinguished baronet, who, it is obvious, was not aware of the passage I have quoted. Nor does his renown rest on this alone. The man whose genius made use of the anæsthetic properties of chloroform for the annihilation of pain, needs nothing more to transmit his name and fame to remote times. He has raised for himself a monument which will last as long as human pain and human suffering are permitted to exist. These ancient fathers of medicine have quaintly, but truly, been compared to giants—the patagonians of the time—who, taking us up in their arms and elevating us above their heads, have disclosed to us countries and prospects which they themselves never could discover. The learned professor then entered upon an elaborate exposition of the obscure and difficult subject of "Disjunction of the Epiphyses," and gave a lucid exposition of the means by which these injuries were to be distinguished from dislocations; and, having concluded this portion of his address, which was purely of a technical character, continued as follows:—I cannot terminate this discourse without congratulating the Members of the Association upon the success which has distinguished their honourable career. It is not in a scientific point of view merely that the British Medical Association has been a benefit to our Profession. Largely has it aided in removing petty jealousies, in smoothing ruffled feathers, and fostering friendly feelings. It is calculated to make the members of the Profession more cautious in the discharge of their relative duties towards society and one another, and to impress upon them the broadness of the distinction that exists between the path to honourable pre-eminence and the starting into notoriety by means which are unworthy, and which lessen the confidence of the public in all that concerns us. To accomplish these important objects is one of its wise purposes; its members seem to be well aware (to use the words of the eloquent author of the history of the Medical Profession in ancient times) that, "to the initiated, medicine is something more than a profession. It is a world within itself. It has its history, its politics, its philosophy, its literature, of which the world at large knows nothing. It has its subsidiary arts and occupations. It has its organizations and institutions, its ranks and grades of honour. It has polemics and dissensions, not always amenable to logic or the learning of the schools. In ethics, in traditions, in superstitions, it is older than the Church. In use before the civil law, it recognises no arbitrary enactments. Nature is its only court of equity." And who amongst us in this vast assembly can forget its everlasting charities, its unnumbered acts of silent and tender mercy, countless as the golden grains of sand! Who can forget its moving scenes of joy and sadness, its many sunny aspects; its benignant, ennobling, and liberalizing influences, which few beyond our own circle can properly appreciate, and none so well understand as ourselves! No wonder, then, that the members of our profession, surrounded and drawn together by such hallowed ties, should be disposed to band together as a brotherhood. Such has always been their course. The Druids of ancient Gaul and Britain, the Asclepiadæ of Greece, the priests of Ancient Rome, the Llamas of Central Asia, the Vaidhyas of India, the fraternities of the middle ages and up to the present time, the countless societies and colleges of our own and other lands devoted to the healing art, are all in proof of this; so that wherever social freedom has existed, wherever tyranny would permit, internal organization and development have been the rule of our profession. And well it is that it is so. We are thereby better enabled to understand our own position, to know how far we have advanced, to whom we owe our progress, the labour that is still before us, and the places we are likely to occupy in the estimation of those who are to follow us. It only remains, sir, to thank my audience for the attention and patience with which they have heard me, and for the interest they have appeared to take in the subject-matter of my discourse, notwithstanding the number present who are as familiar with the topics brought before them as I am myself. I thank them, not merely as a polite formality, but sincerely and from my heart. Those familiar with me know that I am not in the habit of speaking one thing and thinking another. Members of the British Medical Association, for the present I bid you farewell. I take my leave for the present of that noble institution whose founder was, as it were, but yesterday taken away from amongst you, and whose place knoweth him no more at all for ever—an institution, however, the abiding success of which he lived to witness. He placed the texture upon the loom, and he lived to see the well-woven fabrics developed into a bright garment—a radiant robe which soon enveloped in its ample folds the medical profession throughout the length and breadth of mighty England; and my hope and trust is that our children's children—that generations still to come—will behold it with its colours unfaded and its brilliancy untarnished.

SURGICAL COMMENTARIES:

INTENDED AS A DIGEST OF THE AUTHOR'S PRINCIPLES AND PRACTICE, AS ILLUSTRATED BY THE MORE IMPORTANT SUBJECTS OF SURGERY.

By GEORGE MACILWAIN, F.R.C.S., Etc.

AUTHOR OF "MEDICINE AND SURGERY, ONE INDUCTIVE SCIENCE;" "THE UNITY OF THE BODY;" "DISEASES OF THE MUCOUS CANALS OF THE BODY;" "STRANGULATED HERNIA;" "LIFE OF ABERNETHY," AND OTHER WORKS.

OF FEVER: OF THE MODE OF INVESTIGATION,—ITS REAL NATURE, AND THE CAUTION REQUIRED IN SO DOING.

THERE are few subjects on which more has been written than on that assemblage of phenomena to which we give the term fever. Neither, perhaps, is there any one which has more impressively illustrated the various errors which have so often characterised medical researches.

The mischief of that arbitrary division which respectively restricts the labours of the Physician and Surgeon—

the inaccuracy of our nomenclature—the confusion arising from too much reliance on morbid anatomy, as distinguished from pathology—the tendency to regard that as an entity which is a perpetually varying series of phenomena—have each tended to confuse the subject, and to surround much of the difficulty which is inseparable from scientific investigation, with a great deal more that I believe to have been factitious. The very errors seem to me to have suggested the mode of avoiding them, and to have shown that what is required is somewhat more painstaking, and a view that is more circumspect, and therefore more inductive of the various phenomena. Some years since, I put forth an analysis, and that it might be subjected to the severest test, I had fifty copies struck off for private circulation amongst scientific men. It did not, I think, excite much attention in this country, but the Americans, under the auspices of Professor Dudley, reprinted it *in extenso*. All I can do here is to endeavour to give an abstract of the argument, for it seems to me essential to the understanding of what is meant by "constitutional treatment," that, amongst other things, there should be clear and definite ideas as to the nature of the so-called "fever." Few, if any, *began* the investigation of fever in the true spirit of induction more than Dr. Fordyce; but he had scarcely more than begun, when he disregards the very principles which he seemed desirous to observe, by excluding from his investigation fevers which fall under the care of the surgeon. In so doing, he not only excluded a number of phenomena which are essential to the investigation, but he entirely deprives the analysis of the best of all tests, because it is the most severe, and which I do not hesitate to call the synthetical argument.

Now, as the first steps in an inductive research are the most important, I shall not apologise for submitting so homely an illustration as the following:—Suppose a man who had never seen a bird or a feather were presented with a bundle of old pens, tipped with black, and so on, but with one quill amongst them in its natural state, and desired to investigate their use in nature; well, he would find that in length, amount of black tip, length of feather, or some other property, that there were not two exactly alike (we shall in due time see what is intended by the quill). Well, this variety is just what he will find in many investigations of disease. Puzzled at first, he looks for some property which they possess in common. Well, he finds that they are all tough and light, and these properties are brought into higher relief by the very diversity which had puzzled him before. He now assumes that whatever may have been their use in nature, it was something to which strength and lightness were essential. On this, he asks questions, institutes experiments, or forms theories, which may be right or wrong; but he never has occasion to lose sight or undervalue the two common properties. In the analysis referred to I have gone to work in the same way. I have cited a number of fevers, so-called; from the mildest, the most fatal, the best known, and from those which fall under the denomination of common, as well as those regarded as specific, such as remittent, intermittent, and continued fevers, yellow fever, the plague, small-pox, measles, puerperal fever, and so on, in order to bring out certain common characters as distinguished from any in which they differ. It is, indeed, but a faint sketch that I can give of the argument; therefore, I must refer the reader who desires to study the analysis to that work. One of the first things that I observe is, that in all fevers, however severely epidemic—1st. That many escape; and 2nd. That in no individual is any one able to predict whether he will or will not be attacked by the prevailing epidemic. I enlarge on this well-known fact, because it leads, by a chain of many links it may be, to clearer views of the problem before us.

There is no fever which does not furnish examples of this exception; whether we examine common (to use a conventional term) or specific, whether it is a fever seen in the practice of physic or surgery in the ordinary sense of those terms. It is, however, a fact much more instructively impressed in some fevers than others. Suppose we take as a specimen here the plague and small-pox. No fevers suggest more powerfully the influence of atmospheric conditions, yet what we shall by-and-bye retain as alone amongst the common characters of fever, are nowhere more marked than in these formidable specimens. But of that under view at present: in the worst plagues, not only many escape, but, in the general immunity, some of these escapes are remarkable and suggestive.

Amongst a million and a-half carried off in four years, Mr. Baldwyn, Consul-General in Egypt, could not ascertain that a single oilman had suffered.[1] It is said that in Tunis those who work in oil-stores are never affected by the plague.[2] The exemption, also, of tanners from the plague has been observed in Rome, Cairo, and other places.[3] Persons labouring under chronic disorders, and the extremes of youth and age, seem less liable; yet children at the breast, when deprived of the milk, died by hundreds.[4]

In a plague at Manchester infants escaped, and in one at Moscow very few under the age of two years died. The Proto-Medico at Malta said that several infants at the breast took milk until the mothers died without being affected. Sometimes there have been remarkable exceptions among foreigners. In a plague at Basle only Swiss suffered; Italians, French, and Germans escaped. At Hafni, in Denmark, a similar immunity occurred to the English, Dutch, and Germans. Sir Robert Wilson has recorded that in Egypt the British army passed through several villages affected by the plague without its being communicated to a single soldier, and on another occasion Assalini reported that the French army were attacked by the plague, when, notwithstanding their continued intercourse, the Egyptians and Assyrians remained unaffected. It has been observed in certain plagues in Constantinople, that Armenians were the least affected by it. Catholics, (as supposed in relation to certain religious observances), have been observed sometimes to be more affected than Protestants. Various other interesting differences have been observed amongst Turks, Armenians, and Jews. In London, it was observed that amongst those most obnoxious to the plague were butchers. External affections, as buboes and carbuncles, as they are called, were by no means unfavourable to prognosis. Russell observes that amongst the most fatal cases were those who had no bubo.[5] Orrœus remarks that those with bubo for the most part recovered, whilst those with carbuncle or petechiæ died. Both significant under the application of the law of determination to surface.

Those, however, who wish to see what plague contributes to the phenomena of fever will find a most interesting book in Hancock's "Laws of Pestilence," the learned author of a book on instinct, and formerly a colleague of mine, as remarkable for his calm and patient industry in the collection of facts, as he was in his logical application of them. His labours, too, are the more valuable to me, as our objects were different—his being to prove the indigenous origin of pestilence only. No *single* disease is so instructive as to the nature of fever as small-pox. The plague itself has probably not swept away greater numbers. In the Spanish conquest of America, a history not less interesting in its medical than in its moral aspects, all the direct and indirect cruelties of the Spaniards were not more destructive than the small-pox. It has been computed that in less than a century after the arrival of Columbus, it had destroyed more than half the population. In one year (1590) it spread so along the coasts of Peru, that it swept away nearly the whole of the Indians, the Mulattoes, and the Mestichos, in the cities of Potosi and de la Pay, and yet not one Spaniard died of it.[6] But I need not multiply this kind of evidence. The extreme fatality of small-pox is well known. Very numerons are the instructive phenomena of this disease. Let us take the more salient. The

disease then so destructive, so terrible, so much the nature of one proceeding from a specific poison, which, when inoculated, is brought into actual contact with the blood or other fluids of the body, can be so disarmed of all its more virulent characters by a little preparation of the recipient as scarcely to retain the character of disease; and yet a person thus relieved may impart the disease to a person unprepared in its most virulent form.[1] Here is, indeed, a fact pregnant with instruction to Surgeons as well as Physicians, but scarcely, I think, ever fully utilized. When inoculation was first introduced, one of its opponents wrote to prove that out of 182 cases, one had died![2] He would, no doubt, have made it two if, with truth, he could have done so.

These glaring instances, as Lord Bacon would have called them, only show in a more marked form what may be equally exemplified in the practice of Medicine and Surgery on all other kinds and degrees of fever. Unless, however, we trace the links in the chain from the more striking to the less marked phenomena, we shall miss the lesson they teach. We shall be led to regard phenomena as peculiarities which are only more highly-developed common characters of fever, and shall be very apt to adopt a nomenclature which will help materially to obscure the further steps of our investigation.

Almost every kind or degree of fever has some one feature more striking than another, but all fevers have certain characters in common, and they form the only safe basis for further inquiry into the nature of fever. The yellow fever, for example, shows something more plainly than we can see them elsewhere, but whether we examine it and the other varities cited in the analysis to which I have referred, or the various examples of fever occurring in the practice of surgery, you still find certain things in common, as we shall see.

The morbid anatomy of fever has led at times to very curious and erroneous conclusions. When I was for a time, some years ago, doing duty as surgeon to the London Fever Hospital, I was struck by the remark of Fordyce, that fever is a disease of which you can form no idea from the examination of the dead body, but he might have said the same of many other diseases. Morbid anatomy is not pathology, however a useful element in it, and even confusing these terms, as is often done in nomenclature, is not without an injurious tendency.

In fever there is no part of the body in which you may not find indications of morbid action; but there is a great deal of difference in different cases, and different climates. In life no part is more interesting than the skin in fever. The alternations of the state of its circulation, its temperature, the variety in the quantity and in the qualities of its secretions, the multiform vascular phenomena exhibited, which are termed purples, vesicles, pustules, rashes, &c., all exemplify the powerful attempts to determine to the surface, and have very interesting relations to the character and the severity of the malady. Numerous affections extend in certain cases to the cellular tissue of a more or less inflammatory character. In the dead we usually observe vascularity, other morbid changes in the mucous, or serious membranes, often both. We also have structural changes in the organs themselves, but it is important to remember that these almost always imply previous disease, severe cases, or such as occur most commonly in tropical climates. The distinction between recent and previous disease of structure is easy enough to a practical pathologist. In the analysis the morbid appearances are traced through the various structures I have enumerated, and referring the reader who desires more information, I will merely add the impression that they convey, as regards the law of the site of diseased actions; how many diseased appearances we see on the skin in various fevers as compared to all other structures; how many in the cellular tissue and mucous membranes as compared to all other internal surfaces or structures. The mucous surfaces being, in fact, strictly speaking, external surfaces; how many, again, of the serious surfaces when compared to the organs they invest, notwithstanding, too, that the disturbing influences of the body are so commonly devoted to the organs invested by them; and here, again, when organs themselves become affected in fever, how numerous and varied are the disorganisations of other organs as compared with the brain. The *functions* of the brain are constantly more or less disturbed in fever, whilst the morbid appearances are so commonly treated in the membranes by which it is invested or traversed. There seems to me something highly interesting in the conservative tendency, and perfectly in harmony with the law which I have enunciated. I regret I have no more space, but must now go at once to the common characters of fever. Here it is, that both in the analysis and the synthetical argument we derive so much light from surgery. Here we have fevers of infinitely varying type; we have not to deal with external forces which are so recordite, as miasma of various kinds, or of atmospheric changes, of which we know comparatively so little, but with forces, with whose qualities, whether chemical or mechanical, we are familiar, and where they are applied with such frequency to supply us with a large number of observations and experiments, properly so-called, because they may be said to be furnished to us by nature herself.

We have, in the practice of surgery, an immense range of inquiries of all kinds, with and without fever, and in some cases the contrast occurs where there is no perceptible difference in the injury itself. Here we have opportunities of observation as to the condition of the recipient, such as we can easily obtain in no other manner. The importance of that condition has been, in general sense, admitted universally, but what is it? Is it a state that can be only designated, sometimes more, sometimes less, vaguely by the term predisposition? or is it a state that, with a careful notation of the existing, with certain antecedent phenomena, may be so deduced as not only to admit of a more definite expression, but one which will enable us to add to that treatment which is applicable to all fevers, such as is required not merely by the type of the fevers which may be presented to us at one time, but to *the individual case.*

I hope to say something of this in the next paper. In the meantime we submit that the common characters of fever, as gathered from a careful review of the phenomena in the living, as well as the examination of the dead, as put forth in the analysis, and where we deduce the nature and treatment, are the following:—

1. In all fevers one or more of the functions of the body are in a disturbed condition.
2. In no form of fever is it necessary that, however prominent the disturbance of this or that organ may be, it should be disturbed in the same manner.
3. That no fever subsides but as a sequence or coincidence with some secretion[1] or action of vessels.
4. No fever can, with any certainty, be communicated from any one given individual to any other given individual.

(Continued from page 131.)

SOME cases have fallen under my notice in which I could find no trace of any folds, but these are very few, not

1 By secretion here is meant equally increase of some natural secretion, the occurrence of some other, as serum, or pus, or new depositions of any other kind required for the separation of mechanical injuries, and so on.

oftener than once in fifteen cases, or four in seventy. Vertical replications of mucous membrane in one or several rows unite together the transverse valvular folds in some, but these are not constantly present. These valves were early described by Spigelius in 1620, afterwards by Blancard in 1695, more recently by Heister, Wolff, and others. Their function as an Archinedean spiral arrangement for the upward propulsion of the bile was first surmised by Amussat, but to this theory there is a fatal mechanical objection, that their valvular plicæ are immoveably fixed and are not continuous ; we must, therefore, look for their use in the older and simpler theory, that they merely serve to delay the inward and outward current of bile in flowing to and from the sac, and to prevent the unnecessary escape of this secretion, until the pouch has been subjected to stimulation or pressure, for I have found, when these valves were well-marked and the sac slightly distended, that no bile would flow out until compression was brought to bear upon it. There are no glands placed in the substance of the valves, but a few clusters of mucous follicles occur in some of the intervals between these folds near their roots—four of these I found in one interspace, and single ones in others. Some muscular fibres are present in the bases of the upper folds, but they do not seem to exist in the lower valves, or those nearer the duct. The glands, on the contrary, seem to increase in number as we descend towards the ductus communis choledochus.

When we descend the animal scale, we will find that among the quadrumana this organ is almost invariably present, indeed the only reputed exception is the *Oustiti*, which, according to Daubenton, is devoid of a gall-bladder. This, however, may be a mistake, as it is certainly contrary to the analogy of all the other individuals of the order. Its position in quadrumana is always similar to that in man, and its structure and proportion to the bulk of the liver are usually the same as those in the human body. It is long and tortuous in the *Chimpanzee* and *Macacus*, shorter and somewhat triangular or rounded in *Cebus* and *Nycticebus*, pyriform in *Cercopithecus*, and more cylindrical in *Rhesus* and *Inuus*. The largest, proportionally, usually exists in *Simia*, the smallest in *Ateles*.

In *Cheiroptera* it is likewise invariably present, and well-marked ; its varieties in size do not seem to have much relation to the differences of food in the individuals of this order, and the species comprising the neighbouring order of *Insectivora* have, in nearly every instance, this sac very well developed. In the *mole* it is small and rounded, but is larger and somewhat globular in *sorex* and the *hedgehog*. I have not, however, been able to see the hepato-cystic ducts which some anatomists have described in the latter.

Of the *Carnivora* few, if any, are destitute of it. Among felines, it is long and convoluted at its neck in the lion, tiger, leopard, and ocelot ; triangular in the lynx ;[1] pyriform in the common domestic cat, in some specimens of which it has been found double.[2]

Similar instances have been recorded in the kinkajon (*Cercoleptes*). Among canines, it is wide and long in the dog, in whom I have found three to five valvular folds at its neck, and many hexagonal alveoli, with small, secondary, regular pits, containing numerous compound racemose mucous follicles. It is cylindrical in the marten, badger, and civet ; wide and nearly globular in the brown bear. In the wolverene and racoon it is superficial, and lodged in a shallow fissure, while it is deeply sunk into the substance of the gland in the marten, stoat, weasel and ferret. It is very large and tortuous, somewhat intestiniform in the syagush or ratel. The otter, walrus, and seal, besides the ordinary pouch which, in these animals, is smaller than usual, possess a secondary reservoir in the wall of the duodenum. In the latter animal it is situated a short distance below the pyloric orifice of the stomach, and in a small, young specimen, three feet long, this secondary cavity measured 13-16ths of an inch in length, and half an inch wide. In this individual its capacity was three-fifths that of the ordinary gall-bladder. Its shape was ovoid or elliptical, and it presented an appearance of slight sacculation, due to three or four constrictions on its outer coat. The common hepatic duct, which is continued into its upper end, gradually expands into the sac without any valvular fold at the point of communication. It is placed on the posterior and right side of the duodenum, and is beneath the peritoneal, longitudinal, and circular muscular coats of that intestine. It has, however, a special circular coat of its own, consisting of a few irregularly scattered fibres. The intestinal opening is at its lower end, and consists of a small oblique aperture one or two lines in diameter, guarded on its upper and right side by a crescentic valvular fold, not, indeed, a true, perfect valve, as I have been able to drive fluid by compression into the sac from the duodenum without much difficulty. When the sac is opened its mucous aspect appears very smooth, almost devoid of rugæ, as the few longitudinal folds on the intestinal side scarcely deserve the name.

In the seal there have been described several hepato-cystic ducts, but these I have never been able to detect by the most careful examination. There are, indeed, sometimes small hepatic ducts, opening into the cystic duct very near the neck of the gall-bladder proper.

This intestinal pouch in the seal has been the subject of careful investigation by Tiedemann,[1] Kuhl,[2] and Home.[3] The first of these authors describes it as probably a receptacle for the pancreatic juice as well as the bile, an opinion which has been objected to by Meckel, and with reason, as in many cases the pancreatic duct does not open into it, but, traversing the inferior coat of the diverticulum, opens by a separate aperture into the duodenum. Out of five seals which I have dissected, I have not seen any other arrangement than this last described, so in these cases it could not be a vesicula pancreatica.

The Rodentia are rather variable in the presence or absence of this sac. It is present in the guinea-pig, marmot, jerboa, capybara, cavy, beaver, dormouse, porcupine,[4] arvicola, hare, rabbit, myogale, spalax, some species of squirrel, dasyprocta. It is absent in the rat, common mouse, and other species of the genus mus, hamster, cricetus, many species of squirrel, petaurus, echimys, prehensile porcupine, coendou, and others. With regard to this variability, it will be seen that the presence or absence of this sac is independent, *first*, of the natural subdivision of the order into claviculata and non-claviculata ; and, *secondly*, that it is not present or constant in the genera of each family, or in the species of each genus ; thus, for example, the *hystrix cristata* possesses a gall bladder, but *hystrix prehensilis* does not. Many squirrels possess it, and others are destitute ; and some species of *mus* are provided with it, while many others have none. Meckel notices that in many species in which the bladder is absent, the bile duct opens higher into the intestinal canal, perhaps, in some measure, to act as a compensation.

The Edentata often possesses this sac—we find it present in *dasypus* and *manis*. In myrmecophaga, Hunter describes it as attached to ligamentum teres. Wagner mentions that the *Aard-vark*, or *Orycteropus* of the Cape, possesses two bladders, united by their common peritoneal investment, each of these ends in a tortuous cystic duct, which unites with three hepatic ducts, forming a single ductus communis choledochus. The *ai*, or three-toed sloth,[5] is unprovided with a gall bladder, while the *unau*, or two-toed sloth, possesses one.

In the Ruminant order its presence is similarly variable ; it exists in the ox, goat, gazelle, sheep, musk-deer, axis,[6] and nylghau, and in the first and fourth of these distinct

hepato-cystic ducts can be demonstrated.[1] The ox, according to Monro, has a well-developed muscular coat to its sac. There is no gall bladder in the camel, llama, alpaca, guanaco, red-deer, fallow-deer, elk, reindeer, napu, sambur, cariacus, and most of the cervidæ. In some its presence or absence seems to be the subject of variety. The well-known case of the giraffe is a good example of this, in one individual of this animal Professor Owen found no gall-bladder, and in another he found two. Dr. Crisp records its being absent in three individuals, but Gordon mentions its presence in one. It is commonly said that the hollow horned ruminants possess this sac, but that the solid horned are destitute of it, but to this there are exceptions. Aristotle notices that the sheep in Eubœa have no gall bladders, but those of all other places are endowed with this appendage.

Cetaceans are uniformly destitute of this organ, as far as hitherto is known, certainly it does not exist in *Phocæna*, *Delphinus*, *Globiocephalus*, or *Balaenopetra*, and it is recorded as absent in several other genera.

Among the *Pachyderms* we find, likewise, variations, as we might expect in this rather heterogeneous group of animals. It is present in the masked pig of Japan, wart hog, and in the common pig, and the Indian boar, in all of which it is deeply embedded in the hepatic substance. It is absent in the peccary and tapir, the elephant, rhinoceros, horse, and ass. The horse has a dilated duct, but no proper sac, and whether, as the result of the absence of the sac or no, I have been informed by an enterprising friend who tried the experiment of eating the liver of an ass, that even when properly cleaned and cooked, it had such a strong taste of bile as to render it "disgustingly unpalatable." I am not aware as to whether this part of the animal is utilized by our modern hippophagists, and if so, whether the peculiarity noticed above is constant. The *hyrax*, or *daman*, according to Owen, has one central and two lateral sacs, and the bladder of an unascertained quadruped in the Hunterian Museum is described as having three similar accessory cavities.

In Marsupialia it is invariably present, I have found it both in the opossum and kangaroo. In *Phalangista* its position is peculiar, as it occurs on the right of the third lobe from the left extremity of the viscus, but this arises from the unusual fission of the left lobe, which thus masks the typical position of the sac. I have once seen a similar variety in man proceeding from the same cause. In *Macropus* and *Didelphys* an intestinal sac has been described by Leuckart, not always very distinct, however, as I failed to find it in one Virginian opossum, and in a wallaby.

All the monotremata possess this cavity in a condition of full development.

In thus reviewing the orders of mammalia it will be seen that the gall-bladder is constant in bimana, quadrumana, cheiroptera, insectivora, carnivora marsupialia, and monotremata. It is uniformly absent in the cetacea, and variable in edentata, pachydermata, rodentia, and ruminantia.

Among the birds the presence of this sac is the rule, and the exceptions such as the parrot, macaw, pigeon, numidian demoiselle,[1] and ostrich, are not numerous. Hepato-cystic ducts occur in some of the natatorial order, as the cormorant, and some of the laridæ, also in the eagle. The guan or Penelope cristata has a dilatation upon the hepatic duct, as well as a typical gall-bladder.[2] In the swan also the hepatic duct is widely dilated.

I am not aware of any example of the deficiency of this sac in reptilia, it is much more constantly present in this class than in any other; but it is liable to greater varieties of position among reptiles than among other animals. Among chelonia it is usually embedded in the hepatic substance, sometimes completely enclosed as in *Testudo Mydas*, less so in *Testudo Europœa*, and nearer the surface in *Emys Geographica*. In ophidia it is placed remote from the liver, as in the common snake and rattlesnake; in the latter we can see the hepatico-cystic ducts very clearly, some of which, missing the gall-bladder, obtain occasionally a separate entrance into the cystic duct, which traverses the pancreas, as is well exhibited in a specimen in the Museum of the Royal College of Surgeons, Ireland, described by Houston in his descriptive catalogue of the Museum. Crisp[1] found it eighteen inches from the liver, in a python ten feet long.

Lizards are uniformly endowed with a gall-bladder as are the crocodiles and alligators. In amphibia it exists, and in all instances examined of this class, and of the loricates, they seem to possess distinct hepato-cystic ducts.

It is developed nearly as universally in fishes, a few like the *Lamprey*, *Amphioxus*, and *Myxine*, being destitute of it. In some, as the great selache, it is placed at some distance from the liver, and hence this animal was described as destitute of a gall-sac until De Blainville demonstrated its presence; the *Galeus* or *Tope* and the *Lamna* or *Porbeagle shark*, its congeners possess it, and in the latter it is embedded in the liver substance. There is in the Hunterian Museum a specimen of a cod's liver with two gall-bladders. The lophius possesses a duodenal sac as well as a gall-bladder.

In taking a brief retrospect of the vertebrate sub-kingdom, we now see that this organ is most constant in reptilia, next in pisces, more variable in birds, and most so in mammalia. This, however, is just what we might have predicted, for there are more various modes of feeding, and of materials for food in the last named class, than in any of the preceding.

II. We will briefly examine, in the second place, the development of the gall-bladder in its normal condition, and the abnormalities which are described. In the development of the chick in ovo, the first trace of this sac is detected on the ninth day. In the human ovum, at the beginning of the fourth month, it appears as a small cord-like projection, apparently solid in the centre, but towards the end of this month it becomes hollow, and gradually dilates at the fundus, becoming in shape an elongated cone; early in the fifth month, according to Kölliker, the first wrinkle appears on its mucous lining, but I have never seen them distinctly until the beginning of the sixth month. Bile first enters the sac late in the seventh month, and the sinuosities of the neck are developed at the eighth. It seems to have its original in an off-shot from one of the hepatic ducts, at least, so it seemed to Remak,[2] in the chick. At first, it merely contains a little mucus of an alkaline reaction, resembling that of the intestinal follicles, and its cervical valves are not visible before the end of the sixth month; wide transverse ridges in the seventh month appear on the mucous lining of the sac, leaving intervening sulci, and these become interrupted by longitudinal ridges and grooves.

Of abnormalties, in structure and development, many are described; we may group them into varieties of size, shape, position, number and structure.

1. Of size and capacity, I have seen it not larger than an almond, in the liver of a male subject, in whom the vesical fissure of the liver was well-marked, but closely covered with peritoneum, and the small rudimentary gall-bladder lay between the layers of the gastro-hepatic omentum, its cavity was quite obvious, and I filled it with injection with great facility, from the ductus communis choledochus, its coats were of normal thickness, and there was no calculus present.[3] I have seen it six inches long, and nearly ten inches in circumference, in another instance, in which the duct was not obliterated. Cruveilhier notices cases in which the sac contained six, eight, and ten pounds of bile, and Gibson[4] reports an instance where it held eight pounds of inspissated bile. The former author, likewise, notices an instance in which the fundus of the sac approached very close to the umbilicus.

2. Of varieties of shape I have seen it in man, cylindrical,

1 According to Perrault, but Hunter says that it has one.

battledore-shaped, conical, globular, oval, elliptical, or semi-globular, and rarest of all, tortuous and intestiniform, a form described by Meyer in his Anatomy, vol. iv., p. 458.

3. Among varieties of position or relations, leaving aside all those instances of displacement depending upon dislocation of the liver, we may have a pendulous sac, sustained by a mesocyst, which may be complete or partial. It was probably an instance of the latter nature which was noticed by Cruveilhier, as before referred to, where the fundus was bent downwards, and rested upon the abdominal wall near the umbilicus. The gall-bladder may touch the diaphragm, through the deficiency of the overlying hepatic substance as I have seen, and as before referred to. In this class the few rare and doubtful cases of hepato-cystic ducts may be placed, but most of the cases of the kind published are, as far as I know, not very reliable. An altered position of this sac in the liver is rare, but Huschke[1] describes an instance in which the sac lay in the part of the longitudinal fissure lying over the round ligament, and Horner[2] found it to the left of the umbilical fissure on the small (left ?) lobe.

4. Variations of number may be partial or complete. Sömmerring mentions a case of complete duality, like the normal state in orycteropus, described by Wagner, or the variety noticed by Wilson in the cat and kinkajou, by Owen in the giraffe, and by Crisp in the sheep. Partial attempts at duality are sometimes found, as in the longitudinal partition described by Haller in man,[3] and by Ruysch in the ox,[4] or the transverse constriction or septum, which I have seen, and which is described by Huschke as seen in a specimen in the Anatomical Museum of Jena.[5] A partial attempt at variations of this nature may sometimes occur in the form of diverticula or culs de sac, pendent or projecting from the body of the cavity ; this appearance is described by Huschke. Perfect absence of the cavity is very rare indeed, but cases of it are recorded by Amussat,[6] Weidemann,[7] Huber,[8] Büttner,[9] and Richter,[10] the latter case was in a woman, the subject of intense and persistent jaundice.

5. Varieties of structure are frequent as results of disease, but rare as the results of abnormal development. Few of the former bear upon the question of function, and consequently they may be passed by. Thickening of the coats may result from obstruction of the duct, and in a case of this kind Amussat saw the middle coat thick and strong, seemingly made up entirely of muscle tissue. Thinning and distension may arise from the same cause, and the opposite condition may attend the presence of a calculus around which the sac may contract. The pathological conditions to which it is subject are—inflammation, diphtheritic exudation, thickening, patches of excoriation, circumscribed ulcers with elevated edges, abscess between its coats or in its cavity, sero-cystic degeneration, calculi, atrophy or scirrhus, osseous lamellæ on the exterior, and hairs on the mucous aspect.

III. In considering the physiological bearings of all these varying conditions with regard to the use of this organ, we notice that there is a slight difference between the hepatic and cystic bile, for when this fluid has sojourned long in the gall-bladder it becomes less watery and much thicker, its saline components not being proportionally increased as some parts of them are absorbed.

That the gall-bladder is a temporary reservoir for bile we discover on first sight, and that, when not required, this fluid regurgitates through the cystic duct into the sac, to be expelled into the intestine when needed by the contraction of its fibrous coat, and by the pressure of the ascending portion of the duodenum, is obvious, but why its presence should be apparently so capricious[1] is the point to which we shall direct our attention, and we will find, in the firs place, that its presence in carnivorous animals is invariable, the zoophagous cetaceans being the only exceptions, but in herbivorous animals its variations are most marked. The consideration of food may thus have some influence in determining its presence, but if we turn our attention to the manner and times of feeding we will find that there is a great probability that it is in reality the main point of importance in producing the necessity for this reservoir. As a general rule, carnivorous animals take their food at considerable intervals, and in large quantities at a time. This is the habit in all the reptilia and amphibia, and during its digestion they will lie in a heavy torpid state. I have observed this in many snakes, common lizards, and salamanders, and in the common Greek tortoise. Thus we find that in reptilia, in which this is the rule, the presence of the sac is constant. Among other carnivorous mammals the same obtains, and likewise with man and quadrumana, insectivora, and cheiroptera, many of which hybernate, and so spend long intervals without food. The same conditions occur in marsupialia and monotremata ; even the vegetable feeders of which allow considerable intervals of feeding ; while in the cetacea, whose immense bodies have to be sustained on small fish like osmerus (said by Lilljeborg to be the food of Balænoptera), or on still smaller molluscs like clio. A constant feeding is necessary to provide their huge structures with sustenance, and so no gall-bladder exists. There are, however, many difficulties in the way of this theory ; for example, why fishes, which are circumstanced much as are the cetacea, have usually a gall-cyst, but the habits of fishes in general are not those of constant feeding, and there is a lesser disproportion between the food and the feeders in the class pisces than in the cetacea. This is borne out by Dr. Crisp, who found it smaller in ravenous fishes[2] than in others. Birds in general are also accustomed to feed at intervals, as the processes of nidification and hatching occupy much of their time. The ostrich, however, which takes no trouble in either of these works, has no gall-bladder ; and the parrots, who usually make very rude nests in hollow trees, are likewise exceptional. Although it would be hard to see why the cuckoo,[3] who takes no part in either of these processes, should be provided with a sac, except that perhaps its periods of migration afford intervals when the use of a gall-bladder is necessary.

In the orders Pachydermata and Ruminantia, the conditions of feeding are very variable. The huge stomachs of oxen, and their allies, can take in large quantities of food, which then require considerable periods for digestion, while the horse, whose stomach is proportionally small, requires supplies at constant and shorter intervals. These are some of the leading considerations which point to the conclusion that the function of this sac is required in all animals whose intervals of feeding are protracted, and that it is comparatively useless in those animals in whom a continual stream of bile from the liver is required to aid in the almost constant process of digestion.

ON THE QUALIFICATIONS AND DUTIES OF AN OFFICER OF HEALTH.

By H. LETHEBY, M.B., M.A., Ph. D., Etc.,
PROFESSOR OF CHEMISTRY IN THE COLLEGE OF THE LONDON HOSPITAL, AND MEDICAL OFFICER OF HEALTH FOR THE CITY OF LONDON.

(Continued from page 126.)

AGAIN, to the superintendence of the registration of deaths there might be added the duty of informing the coroner of the necessity for an inquest, and even of assisting him in the medico-legal part of his investigations ; for who would be so well acquainted with the circumstances of a

1 Herlin extirpated the Gall-bladder in cats without much inconvenience subsequently.
2 P. Z. S., 1862, p. 138.
3 Cuvier says the cuckoo has no gall-bladder, but one exists, sometimes at least, in cuculus canorus, and Crisp describes its existence in C. glandarius and orientalis.

suspicious death, as the Medical Officer who had the superintendence of the return. At present this duty is performed by an ignorant and irresponsible officer, the parish constable; he it is who makes all the preliminary enquiries which are necessary for the action of the coroner, and it is not too much to say that both the ignorance and interests of this functionary may provoke enquiries which are not needed, and suppress others which are most requisite. In fact the unseemly contests which have been maintained by coroners and magistrates in respect of the expenses of inquests, and the necessity for conducting them, have been caused, in great measure, by the stupidity and officiousness of the parish constable, and by the imperfection of the data on which the coroner has acted. Give him the assistance of an officer who is competent to undertake the preliminary enquiries, and to determine whether there are good grounds for supposing that death has not arisen from natural causes, and the function of the coroner would be far more effectively performed.

The medical officer might likewise assist the coroner in the investigation of the case throughout the whole of the proceedings. He might be present at the post-mortem examination made by the medical attendant; and he might witness, if not conduct, the toxicological part of the enquiry. Such an officer would soon become an experienced adept, whose knowledge would be of infinite value in the administration of justice, and whose independence and public position would place him above the suspicions which now attach to the motives of a professional expert. There can be no doubt that, with the assistance of such an officer, the progress of the coroner's investigation would be more certain, and, the result of his enquiries, the verdict, more conclusive. He would also put a stop to the costly proceedings which too often end as they began with the mere fact of "found dead," nor should we be perplexed with the unmeaning, if not mischievous verdict of died suddenly, died from grief, died of a broken heart, or died by the visitation of God.[1] In fact, the certainty of discovering the cause of death would not only give more precision to the coroner's verdict, but by exposing secret murder, would inspire the criminal with dread and the public with confidence. Inquests would perhaps be less frequently conducted, and thus far their expenses would be saved; but when conducted the enquiry would be needful, and the issue wonld be certain. Already the magistrates of the county of Middlesex have decided that there is occasion for some such an officer to assist the coroner; but I fear they have misapprehended the scope of the appointment, and the duties of the office.[2] The aim of the appointment should be to gain certain information as to the necessity for an inquest, and to give trustworthy assistance to coroner and magistrate in the medico-legal part of the investigation. This can only be done effectually by a trained, a skilful, and an experienced officer like an officer of health, whose collateral duties would help him in the investigation.

Some such a notion has pervaded the minds of all who have carefully considered the subject, and the writings of Mr. Chadwick, Dr. Sutherland, Dr. Southwood Smith, Mr. Rumsey, and many others, abound with illustrations of its necessity and importance. Even the coroners themselves are of opinion that their hands would be greatly strengthened by such an appointment. In fact, there cannot be a doubt that, with the assistance of such an officer, the functions of the coroner would be more effectively performed, the expenses of his office would be considerably reduced, and the results of his inquiries would be conclusive and satisfactory. In this way the aim of justice would be reached, and the safety of the public secured.[1]

And, besides the supervision of the mortality returns and the registration of deaths, the Medical Officers of Health might organise and superintend a registration of sickness. He might gather up and classify the returns of hospitals, workhouses, unions, and dispensaries. He might note the specialities of disease among the different classes of the community, and in the different circumstances of habit, cleanliness, situation, density, &c. He would thus contribute to the ætiology of disease, and to the knowledge, now so meagre, of the laws of sickness. This, indeed, is a branch of sanitary statistics which has yet to be cultivated, for we have little or no accurate information of the rates of sickness at different ages, or of the influence of it upon the efficiency of labour. The mortality returns inform us of the fatal effects of disease, but they give us no idea of its lesser influences. They tell us of the killed in the battle of life, but they say nothing of the wounded and the disabled. It is true that the records of the public service, as the army and navy, the customs, the post-office, and the police, as well as the registration returns of friendly societies, have done something to elucidate the subject; but these data are far from being satisfactory. In the former case they are deduced from a class of individuals altogether exceptional, because they are picked men, at particular ages, and are occupied in a peculiar manner; and in the latter case the returns are indefinite, and careless and unsystematic. Besides which, they neither of them furnish sufficiently distinct information of the habits and home influences of the several classes.

Even in the case of hospital and other such statistics already alluded to, they must be enlarged beyond their present scope before they can be of much service. They must embrace the questions of residence, occupation, and the general habits of the sick, as well as the course and issue of the malady. They must also give evidence of the influence of specialities of practice, and of the tendency in particular institutions to treat particular diseases. It was for want of these considerations that the statistical returns of sickness, published by the Medical Officers of Health for the Metropolis, were abortive, and were so soon brought to a conclusion.[2] It is clear, indeed, that we have yet to establish a sound and comprehensive system of registration of sickness before we can deduce the laws of its occurrence, and the general rate of its distribution, before we shall be able to estimate its influence on labour, and on the effectiveness of the various classes of the community. This is manifestly an important branch of sanitary statistics, for it would form

1 In the year 1838 and 1839 there were about 35,000 inquests held in this country; and of this number, 6708 ended in the verdict of "sudden death." Even in the metropolitan districts, and in the large towns of Liverpool, Manchester, and Birmingham, two out of every three inquests of sudden death were concluded unsatisfactorily, as by such returns as found dead, died by the visitation of God, or died naturally. (Dr. Farr, 3rd Annual Report of Reg.-Gen., p. 91, 92). And more recently in 1856, according to the returns of Mr. Redgrave, there were 10,285 inquests of the 21,801 held in the whole country in which the verdicts were most unsatisfactory. For example, there were 7102 in which the verdict was "natural death" without specifying the cause, and 3183 in which it was "found dead" (19th Annual Report of Reg.-Gen., p. 197.)

2 "*Appointment of a Post-mortem Examiner.*—Upon the third subject of reference, that of the appointment of a medical officer, your Committee have to report a complete unanimity of opinion on the part of the witness who have appeared before them, in favour both of the utility and importance of the measure. With reference, indeed, to this point Mr. Bedford (the Coroner for the city and liberties of Westminster) has not scrupled to express his opinion, that in no case of sudden death, in which an inquest is proper at all, should a post-mortem examination be dispensed with; and that, without it, the proceeding is worse than useless. He considers it to be absolutely useless, because it affords no indication of the slightest value as to the cause of death; and worse than useless, because the show of investigation which is thereby presented, tends to lull suspicion, and, where actual guilt exists, to screen it from detection. But if it is important to have post-mortem examinations at all, it is equally so to provide means for their being efficiently performed. And the object, your Committee believe, cannot be attained except by the employment of practitioners whose attention has been specially directed to this difficult branch of medical science, and who have the benefit of continued practice in it." Report of the Special Committee appointed to consider the duties and remuneration of coroners, and also whether it is desirable that a medical officer should be appointed to the Coroner's Court. Middlesex Quarterly Sessions, 1851.

1 In Germany, the *Kreis-physicus*, a District Physician, has this very duty assigned to him; for it is his business to promote and aid medico-legal inquiries of all kinds. He is to make examinations for inquests, with the co-operation of the District Surgeon, and is to attend on all sudden occurrences dangerous to the public safety.

2 In the month of April, 1857, the Medical Officers of Health of the Metropolis commenced the publication of a weekly return of the cases of illness treated in pauper practice and in the public institutions of London. It embraced, on an average, about 10,000 new cases per week, treated in 43 workhouses, 35 hospitals, 43 dispensaries, 13 asylums, and 5 prisons. The diseases were classified under 22 heads, chiefly zymotic and pulmonary. The returns were continued for one year and seven months, and were then unexpectedly stopped. A similar weekly return has been published for Manchester and Salford.

the basis of a national pathology; it would furnish the means of determining with accuracy the proximate causes of disease, and the influences of climate, season, situation, occupation, and social habits. It would serve, also, to indicate the advent of epidemics, the laws of their occurrence, and the circumstances which keep them in check. So large a consideration evidently demands an effort for its fulfilment, and none are so well able to assist in its realization as the Health Officers of the country.

There is yet another subject connected with this part of his duties which might be advantageously committed to him, it is that of advising the poor, in the time of death, how best they may dispose of the corpse. Hardly anything is so perplexing to them, and so trying to their feelings, as the taking care of the dead body until it can be buried. Having generally but one room in which they lodge and sleep, they are obliged to keep their dead among them until they can find the means and the opportunity for burial. There it putrifies, and taints the air, and too often spreads disease among the living. At such times the Officer of Health, whose mission is respected by the poor, might advise and even assist in the disposal of the corpse, by either recommending the use of disinfectants, or the removal of the body to a convenient place where it would be safely kept and respectfully treated. Service like this would not only be useful to the individuals, whom it most immediately concerned, but it would also be useful to the public by preventing the spread of disease; for in times of pestilence, or when infectious disease has been the cause of death, measures might be taken to prevent its propagation.

Again, the functions of the Medical Officer of Health might very properly embrace the examination of articles of food and drink. Already this duty is assigned to him in several of the districts of this metropolis, as in the City of London, in the parish of St. James, in that of Marylebone, Islington, and some others; but instead of waiting, as the Act directs, for a complaint on the part of a purchaser of food or drink, he should be empowered to make a systematic examination of the things sold in his district. This would be the means of exposing fraud, and of protecting the public, especially the poor, from the mischiefs of adulteration—mischiefs which are far more serious to health, and to the vigour of the body, than they are to the ethics of trade.

Lastly, and above all, it should be remembered, as Parent-du-Chatelet has truly observed, that the duties of an Officer of Health should include the esteem of the public, for his functions do not merely relate to the salubrity of a district, or to the question of the healthiness or unhealthiness of any trade, or building—these are but the material parts of his mission—they must also relate to the good opinion of those among whom he labours, and be supported by his moral action. There are many occasions, especially those of secondary importance, which occur most frequently, when an officer of health acts as an intermediate agent between the public and the administration, when his functions are those of a conciliator, when he has to listen to complaints of grievances on one side, and angry recriminations on the other. Judging, however, solely of the question of public safety and public health, and disregarding, or calming down the animosities with which the complaints are too often beset, he should endeavour to decide in such wise as to satisfy the demands of the administration, as well as the reasonable objections of opponents. His advice, indeed, should be such as will not only meet the requirements of the case, but will also gain the assent of every good citizen. Above all, he should ever oppose himself to all vexatious and litiguous proceedings, to all unfounded misapprehensions, and to all exaggerated views of public sanitary questions; for nothing is more likely to impede the progress of knowledge, and to bring the functions of his office into disrepute, than the unchecked fancies of visionary alarmists, or the still more mischievous opinions of sensational agitators.

Hospital Report.

ST. BARTHOLOMEW'S HOSPITAL.

A CASE OF TRAUMATIC ANEURISM SUCCESSFULLY TREATED BY PRESSURE.

Under the care of Mr. HOLMES COOTE.

It is not often that we have the opportunity of recording cases of aneurism successfully treated by pressure in the London hospitals, and we therefore have much pleasure in furnishing our readers with the details of a case that has recently caused a good deal of interest among the frequenters of the wards of St. Bartholomew's. The case is of the more importance, since it is obvious that its nature was overlooked at another hospital, where the patient had previously applied. We may add that, in going his rounds, Mr. Holmes Coote, under whose care the patient has been cured, remarked once or twice to the gentlemen who accompanied him that probably some of the failures in London arose from too great pressure being applied. He believed that it was quite unnecessary to completely arrest the circulation, as some seemed to attempt, a very slight contraction being sufficient to cause the formation of a clot. He considered that the Dublin Surgeons had been so successful from their careful discrimination of the amount of pressure required, and their steady adherence to this the chief point in the treatment.

The following are the particulars of the case that leads to these remarks:—

George B., æt. 42, was admitted into St. Bartholomew's Hospital, July 19. He said that while at work four weeks ago he let fall a needle about three inches long, transversely between the thighs, and instinctively closing the limbs, he ran the point into the right member, over the situation of the femoral artery. Profuse hæmorrhage immediately ensued, which continued, in spite of bandages, until he became faint. He gave up work, and went home to bed. The bleeding, however, recurred, and soaked through handkerchiefs and bedding; but after a time it again stopped. He could not estimate the amount of blood lost, but thought it was over one pint. The next day he applied to another hospital, where he received dressings, and was told to attend as an out-patient. The bleeding did not return, and after three weeks he was discharged.

The limb, however, at this time, was in a very unsatisfactory state. It was much discoloured at the seat of injury; it was weak, cold, and numb, and there was great pain when he attempted to use it, especially in the ham. The measurement was five inches more than that of the sound limb—namely, 21 inches, to 16 inches sound limb; and there was a longitudinal pulsating tumour occupying about four inches of the inner part of the thigh. The punctured wound was closed.

The treatment by pressure was determined on by Mr. Coote, who applied the proper apparatus July 27th.

August 3rd.—The pulsation has entirely ceased; the tumour is a firm mass; the limb is not more than one and a-half inch larger in circumferential measurement than the other; all pain has subsided, and the patient, a very intelligent man, says that he feels he could use the limb as well as before.

Measurement.—Right limb, 17½ inches; left limb, 16 inches.

5th.—The pad was removed for a time from the artery to-day; no pulsation returned in the swelling.

The report of the Medical Officer of Health for the City of London for the June quarter has just been presented to the Commissioners of Sewers. The amount of diseased meat condemned of late has been much above the average, 47,467 lbs. during the quarter. 6547 houses were inspected, and 1528 improved. At Billingsgate 139,445 fish, 75 bushels of perriwinkles, and 2859 gallons of Shrimps were condemned as putrid.

WEDNESDAY, AUGUST 14, 1867.

THE BRITISH MEDICAL ASSOCIATION.

THE warm grasp of the hand, the hearty Irish *cead mille failthe*, and the generous hospitality with which the Profession in Ireland has met her Saxon brotherhood, will linger in remembrance long after the blue hills of Wicklow have been left behind, and the rich melody of the Irish speech has been forgotten. The gathering of the British Medical Association, its scientific fruits made richer by the noble struggle for superiority between the great schools of England, Ireland, and Scotland, has achieved greater results in the narrowing of the separation between classes, and in the levelling of the barriers set up by ignorance and prejudice between the Englishmen and their Irish colleagues. For the first time the opportunity has occurred for the Medical men of England to acquire that experience of their Irish brethren which is essential to the sympathy which ought to exist, and the want of which has hitherto impeded the unity of the Profession, and we trust we are not too sanguine in our hope, that the favourable impressions which have been derived from the interchange of the *entente cordiale*, may permeate far and wide through the ranks of the Profession, and may lead to a more thorough appreciation and a higher respect for the Profession in Ireland. It is true that the Irish School of Medicine and Surgery has always received a willing recognition from the Profession throughout the world, and has occupied a scientific rank which, in this Congress, it has worthily maintained, but the social *status* of its Members, those qualities which could only be developed by the bonds of personal friendship, have been too long unknown, and we anticipate that the information which a majority of the British Medical Association carried with them, that the Profession in Ireland, whether in scientific acquirements, in the rank which its Members occupy, or in the social qualities which they possess, occupies a position second to none, cannot fail to secure for Irish Medical men a consideration which they can claim nowhere so well as on their own ground.

It is in the social direction that most importance attaches to the late assembly, for it must be confessed that the scientific results have been rather disappointing. Addresses from the lips, and spoken with the authority of such men as CORRIGAN, STOKES, and RUMSEY, are, in themselves, worthy in the highest degree of such an occasion, and, of itself, the eloquent and learned speech of Professor SMITH, stamped the meeting with a high scientific character, but dissertations on abstract subjects can hardly redeem the purely Professional transactions from the want of originality which pervaded them. With the exception of a very few communications, and notably of those in the physiological section, the papers read were neither very novel nor very interesting, and many of them were little else than the repetition of facts and opinions, with which the Profession has been already made acquainted through the public prints. We trust that the future efforts of the Association may be productive of better things, and that we may yet see its assembly marked by such a burst of original and scientific contributions as has always marked the meetings of the British Association for the advancement of science. The Congress of the Association is surely worthy of a better object than the public repetition of experiences and opinions, which every literary Surgeon or Physician has not only in his remembrance, but on his book-shelves.

THE ENGLISH REGISTRAR-GENERAL'S QUARTERLY REPORT.

IN these days, when vital statistics are studied by large numbers of the population, we shall, of course, be expected to select for the convenience of our readers, a few of the facts with which the Quarterly Report of the Registrar-General, just issued, literally teems. In the three months of April, May, and June, the health and well-being of the people was considerably above the average, affording ground for renewed thankfulness and confidence. The birth-rate of the quarter is the highest on record for this portion of the year, while the death-rate is below the average of the season, and, in fact, furnishes the lowest rate for this quarter during the last ten years. The exact number was only 21 in the 1000, as against 24 for the same season last year, or 22 as the average figure.

The natural increase of the people of England was at the rate of 957 daily, being a total of 87,126 for the quarter, the number of births having been 199,649; the deaths only 112,523. There is, however, a slight deduction to be made from the increase on account of emigration, since 16,718 persons left England during the quarter. Taking this into

account, the nearly 1000 per day (in round numbers) added to the population is reduced to 750. Even this figure is, we apprehend, sufficient to inspire more than confidence. We have learned to look upon every addition to our population as a sure sign of increasing strength and prosperity. No one now dreams of feeding the starving by reducing the number to be fed, but every such report as this is at once pronounced most gratifying.

The Medical Profession has peculiar reason to congratulate itself on the result, when it is remembered that a very perceptible proportion is due to its untiring efforts for the good of the people. It is a fact that the favourable state of the public health is, to a large extent, due to the great sanitary improvements that have been accomplished upon the earnest persuasions of the Medical Profession. This is particularly exemplified in the fact that the most marked decrease of mortality has been seen in those districts in which the greatest sanitary precautions have been adopted. In the town districts, comprising a population of eleven millions, the improvement of the quarter represents the saving of 33,000 lives per annum—supposing that we should be able to prevent any deterioration, and our sanitarians are all hopeful of further ameliorations.

Here, then, we are already reaping the reward of our labours, and—we urge the fact upon all reluctant local authorities—that reward is in exact proportion to the labour and expenditure incurred. In districts where able and zealous medical advisers have had free play, the mortality has greatly decreased, but where obstinate and ignorant local boards and vestries have refused to move, the penalty has been rigorously exacted. London and Birmingham have reduced their mortality to the annual rate of 20 per thousand, in spite of the disadvantages said to attach to large cities. Edinburgh and Glasgow exhibit the high rate of 29, although each of these northern cities possess peculiar advantages. Why should such a discrepancy exist? The same lesson is to be learned by every township in the kingdom, and we trust the constituted guardians of each will study with care and impartiality this important report.

One point to which the Registral-General adverts, may detain us a moment longer. He points out that the plague, which is now raging in the East, has been banished from these islands. We may add, that in no country has so much control been obtained over epidemic cholera. This scourge, so much dreaded on every hand, can only be restrained by the most vigorous application of the principles of sanitary science, and seeing that we are by no means safe from an early recurrence of the disease, we trust the many warnings that have been uttered, will no longer be neglected.

Up to this point we have made no mention of the marriage-rate. This omission is intentional, not because the figures are less encouraging, which, perhaps, may be conceded, but because the marriage returns are not made up to the same date. The returns of marriages now issued are, in fact, those that were solemnized in the winter quarter, and they cannot therefore be fairly included in a picture of the spring. The real state of the marriage return will be shown when the next quarter's report of births and deaths is ready. Considering the importance attached by the public to the marriage-rate, we feel called upon to point out this fact, and to express our surprise that hitherto no attempt has been made to comprise all the statistics of the period in each report.

THE MENTAL CONDITION OF THE LATE MRS. THWAYTES.

(SMITH AND OTHERS *v.* TEBBITH AND OTHERS.)

JUDGMENT was pronounced on the 6th instant, in this important cause. In the Court of Probate, Sir James Wilde delivered a lucid and able judgment, which it is impossible to analyse in the space of a leading article. We may, however, sum up a few of the incidents of the trial, and so clear the way for a consideration of such special points as are likely to become precedents, or are deserving of full discussion.

The late Mrs. Thwaytes, resided in Hyde-park Gardens, and possessed a country house near Worthing. Having inherited large property from her deceased husband, she made a will in favour of Dr. Smith, and Mr. Samuel Smith, to the complete exclusion of her blood relations. The will was opposed by a sister, and two of her sister's children, on the grounds of incapacity and undue influence. The will in dispute disposed of property to the extent of £400,000. No one need therefore be surprised that the trial was prolonged and costly. It was argued on the one side that Mrs. Thwaytes was for upwards of thirty-years a complete monomaniac; on the other, that she was rational enough to exercise ordinary prudence in worldly matters Some went so far as to speak of her monomania as akin to the religious fervour and beliefs of such minds as that of Luther or Bunyan. How far such a notion could be entertained, may be judged of by the following statement. which, for the sake of impartiality, we take from Sir J. Wilde's judgment :—

"She had said to different witnesses 'that she had inter course with the Creator, that she was the Holy Ghost, the third person in the Trinity, and Mr. Simm Smith was the Father; that she was above God seven degrees; that she sent the cholera or the influenza through all creation, and that it had to go through her first; that the brutes had been attempting to poison her; that one stage of her work was blindness; that she had gone through the new birth, every bone and sinew and drop of blood had been made new; that if the Almighty lost her everything would go to chaos; that she was about to bring forth the Saviour of the World; that the Tebbitt family were doomed to everlasting perdition; that she held direct communication with the Father; that the judgment of the world was to take place in her drawing-room in Hyde-park; that Dr. Smith knew everything she did; that she was the first great cause and the pivot on which the whole world hung; that

at one stage of the work the Doctor required large sums to carry it on; that it seemed foolish for her to make a will, as she was immortal, but she must act in nature; that she had a headdress of hair and a coronal of diamonds made expressly for the Judgment Day; that Mrs. Curtis was a child of God, and was obliged to fall on her knees and worship her, for she knew she was the Holy Ghost; that when the work was finished they would have Buckingham Palace and Windsor Castle; that she and the Doctor made the thunder and lightning, and were in their glory in a good thunderstorm; that they were the Supreme Beings, and communicated together, though they were absent from one another; and that the judgment was to take place in her drawing-room, and she was to take part in it with the Lord Jesus Christ in connection with Dr. Smith.'"

Now, how any rational person can conscientiously confound such a jumble of sacred and paltry things as this with the deep enthusiasm or belief in evil spirits of such minds as Bunyan and Luther, is almost beyond comprehension, and we look upon the question—were Luther and Bunyan mad?—in regard to such a case as this, as a species of trifling unworthy of the merest tyro in sensational paragraph-writing. We do not forget, indeed, the extreme difficulty of conveying to those who have never thought upon such subjects, any clear and definite ideas of insanity; nor are we unaware that, according to the definitions that some authorities have proposed, it might be easy for one-half of the world to pronounce the other half mad. But even the most thoughtless members of society would at once distinguish between the so-called madness of such a genius as Bunyan, with its full noon-tide of mental life, and the midnight darkness of such a state of mind as that portrayed in the passage we have cited. We are, of course, Presuming that the evidence as to this condition is worthy of credit, and in doing so we are only accepting the conclusion of the Court. This may be a point for further consideration, though it can in no way affect the present argument, or rather protest against the confusion of things sacred and trivial. Very aptly on this point did Sir James Wilde cite the words of Burke, to the effect that "though no one can say where twilight begins or ends, there is ample distinction between day and night."

A subject of the greatest moment is the peculiar relations of Mrs. Thwaytes to Dr. Smyth. He seems to have first become acquainted with her in a professional capacity, having attended her in what he calls a low fever, marked by nervous excitement. Her delusions seem to date from that period. She gave him an annuity of £2000, besides various sums of money, in the whole about £50,000; but so far as we gather, no clear explanation of the purposes for which this money was given has been offered. Dr. Smith visited his patient regularly, and he received her dividends for her and paid them into the bankers. He states that she never spoke to him of any spiritual work in which they were jointly engaged, though to other persons she seems constantly to have done so. Taking this part of the evidence together, we confess that the case is most peculiar, and we cannot feel surprised that the Court pronounced the testatrix of unsound mind, and therefore set aside the will. Apart from the doctrine that any persistent monomaniac is sufficient to prove testamentary incapacity (a doctrine, by-the-bye, which we question whether our courts will uniformly maintain, notwithstanding this judgment, and which we should certainly like to see further sifted), the delusions in this case were so obviously likely to influence the will in Dr. Smith's favour, that it was by no means unlikely to be set aside. We should have been glad to devote a few paragraphs to the relations between physicians and patients, as exemplified in the case, but space at present forbids, and such lessons as may be learned from it are by no means deeply hidden.

To those readers who may be interested in the question, we commend the whole judgment of Sir. J. Wilde as meriting an attentive study.

THE HEALTH OF LONDON.
INCREASE OF DIARRHŒA.

In our last week's article on the public health we were compelled to draw attention to the rapid increase of diarrhœa in London, as shown by the Registrar-General's report. This week we have to announce, on the same authority, a still further increase of this disease. It is, indeed, to be admitted that, at this season of the year, such an increase is no unusual occurrence; yet, considering the apprehensions that may naturally be entertained as to a reappearance of cholera, and the numerous isolated facts that we are continually called upon to chronicle respecting the existence of that disease in an epidemic form in various parts of the globe, it is a fact to which we are desirous of drawing the attention of the Profession, as one that may eventually prove of greater consequence than is at the moment commonly believed.

The number of deaths from diarrhœa registered in London during the last seven weeks have been as follows:—16, 48, 54, 115, 170, 196, and 217. Of the 217 deaths last week, only eight were those of adults, 209 being those of children—a sufficient proof of the nature of the affection. In addition to these 217 deaths, there were recorded during the week 19 deaths from cholera or choleraic diarrhœa, of which 17 were those of children, and only 2 those of adults. These figures still further confirm those mentioned above as to the nature of the disease so fatal to young lives. By way of contrast, we mention that in the corresponding week of last year the deaths from cholera were 1053, and from diarrhœa 354. As a still further fact pointing to similar conclusions, it should be mentioned that the deaths were last week distributed pretty equally throughout the several districts of the metropolis.

Now, we cannot but feel that statistics of this kind should give rise to serious reflection on the part of our Profession. It is to us that the great public must look for direction and assistance, and it should be our care to offer timely caution. There is possibly a tendency to regard diarrhœa as of too little moment. In spite of all the connection that has repeatedly been urged between diarrhœa and cholera, it may well be that their various relations have not yet been studied as fully as they deserve.

While every variety of treatment has been tried in both diseases, the Profession, as a whole, seems to have adopted no conclusion unless the rough-and-ready one that diarrhœa is mostly amenable to our art, while cholera is not. But if this be so, why this excessive and continually recurring loss of life from the curable disease?—a loss, on the whole, greater than that of the more intractable malady. Can it be that, with all our conflicting methods of treatment, we have not hitherto learned to hold in check as completely as we might the milder disease? or the preliminary stages of the more fatal one? Questions of this kind are most wholesome, but it is very difficult to enter into them without some reference

to therapeutic methods, and we are particularly desirous of avoiding in our leading columns the advocacy of any one in preference to others. It will be necessary, however, to allude at times to the majority. Last year, under the title of "Theories of Cholera," we published some articles of this kind, and propose to continue them from time to time. On this occasion we shall couclude by the mention of a method of treating disease which has been fully explained by its proposer in this Journal—more especially in reference to diseases of the nervous system, but which he believes peculiarly efficacious in both cholera and diarrhœa. We allude to the application of heat and cold to the spine, by which Dr. Chapman thinks he has discovered a mode of arresting many morbid actions, including those in which intestinal flux is so prominent a symptom. In perusing his work on Cholera, we have found at pp. 244-5 a passage so apposite to the questions we have propounded above, that we shall conclude this article by citing it—for it contains not only the reply of an able observer to some of our questions, but, in a brief compass, a statement of the author's conclusions, and an account of the manner in which he would desire other experimenters to proceed in the attempt to confirm or invalidate his theory. He says :—

"I strongly recommend those physicians who are disposed to avail themselves of the remedial power of cold and heat applied along the spine in the treatment of bowel affections to make a beginning with cases of diarrhœa and cholerine. As these phases of cholera are much less formidable than actual collapse, they can be treated more at leisure and with less anxiety as to the result than is possible in cases of collapse; hence more opportunity is afforded for calmly observing and studying the effects of the treatment; and as the patients in these early stages are less restless and exert more control over themselves, they are more likely, without the aid of an ice-bag jacket to keep the ice exactly along the centre of the spine, and thus to give it the best chance of exerting its utmost beneficial influence. Moreover, in the majority of such cases the need for the application of heat to the general surface of the body while ice is being applied to the spine is much less urgent, as hot-water bottles to the feet only will often suffice. Therefore in these the effects produced can be almost exclusively ascribed to the spinal ice-bag as their cause, and the most exact conceptions can be formed of its therapeutical value. Such patients have not yet become seriously anxious or alarmed about themselves, and retain nearly all their mental vigour and self-possession; their power of observation and description being comparatively unimpaired, they can give an exact account of their symptoms before anything is done, and of their experience from hour to hour of the effects of the ice on each segment of the body after the treatment is begun, and while it is continued. In this way it may be accurately studied, and he who thus really acquaints himself with it will find himself most fitly prepared to treat the disease in its most formidable aspect of collapse. The wise precept, 'Proceed from the simple to the complex,' or the more homely saying, 'First walk, and then run,' is just as applicable here as it is in every part of life ; and I may observe here, that the determination to test the efficacy of the treatment in question in the worst cases first has not been most conducive to a speedy, as well as correct appreciation of its value. The number of fatal cases of diarrhœa in London during the passing summer has been very large, and the returns of each week still show that about a third of all the persons who are destroyed by diarrhœa and cholera conjointly, die of diarrhœa, notwithstanding the asserted power of medicine to subdue this disease. Surely if, as I assert, the spinal ice-bag is a greater power, it would be worth while to try if it would not save these lives. But, indeed, diarrhœa does not seem to arrest the attention and excite the interest of even the medical profession to an extent proportionate to its destructiveness. The weekly average mortality of London may be increased by the death of a hundred persons by diarrhœa without causing any interest or surprise ; but if it be increased by only fifty deaths from cholera, serious apprehension is felt, and the public journals resound with alarm. There may be, and I dare say there is, adequate reason for this ; but that diarrhœa is, comparatively, a neglected disease, and that its great dangerousness and fatality are not duly borne in mind are facts which can scarcely admit of dispute.

"I do not hesitate to affirm that the evidence and arguments contained in this volume justify the conclusion, that by the intelligent and judicious use of the spinal ice-bag, death may be averted in every case of infantile diarrhœa, summer diarrhœa, cholerine, and the early stages of so-called Asiatic cholera ; and that were each soldier in India compelled to apply one bag of ice along the lower half of the spine until the ice has melted during those days when he is marching, we should hear no more of the extraordinary phenomenon of the especially great mortality of soldiers in India when moving from one encampment to another."

Notes on Current Topics.

THE SALE OF FOREIGN DIPLOMAS.

We recommend the statement on this subject made by Sir Dominic Corrigan, in his address to the British Medical Association, the accuracy of which we are in a position to prove, to the notice of the Hon. Mr. Walpole, and we venture to enquire whether, in that gentleman's opinion, the clause which he endeavoured to force into the Medical Amendments Bill, putting the legality to such practices at the discretion of a Secretary of State, would, in the face of such a condition of things, be a wise provision.

Sir Dominic Corrigan says :—

"It is notorious that both in Germany and America there are universities that sell their diplomas just as they sell beer or Indian corn to all who can afford to pay for them. I have received other evidence since. A gentleman connected with the medical and literary press of London has placed a document in my hands, in which he certifies that an American agent called on him this present year with diplomas duly signed and sealed by one of the American colleges, nine or ten years old ; he could have a supply fifteen years old if required. He had a variety in stock, price £20, and would allow a discount off, as it was a matter of business. This gentleman is quite ready at any time to verify the memorandum and to give his name. I have within the last week received letters from two members of the Profession, one of them a president of one of our Branch Associations, in which he encloses to me a communication from an agent in Glasgow, in reply to a commution for the purchase of a foreign diploma ; and I am sorry to say an M.D. of one of our universities. The letter is so characteristic that I shall make no apology for reading it at length:—

"Ewing-place, Glasgow, 24th July, 1867.

"Dear Sir—After having had the pleasure of your note of the 6th instant, I write you in direct course. I stated in terms of my said letter that no university but that of the State of Pennsylvania gave degrees of 'Medical Doctor *in absentia*,' the cost being £32 12s., and in full of all demands and delivered free. I also stated in terms of my said note that the university of Giepen, of Hesse-Darmstadt, gave degrees of M.D. for £22 paid there, and £15 10s. paid here, and also in full of all demands. In either case I will cheerfully assist you or your friend in obtaining the object in view. As I have four new degrees to get at Pennsylvania next week, and other four at Giepen also, please send me £32 12s. for the Pennsylvania degree, or £15 10s. in part of the Giepen degree, and I will send all the requisites to you in course.—I am, my dear sir, truly yours, "————, M.D.

"To give this epistle due dignity there is inscribed on the envelope 'On her Majesty's service.' It is scarcely necessary to observe that I have in my possession the documents and the names."

We may add, as a corrollary to these facts, and we do so without fear of contradiction, that, in respect to some of the licensing bodies of Great Britain, the traffic in diplomas between avaricious and unscrupulous corporations and debased and ignorant medical traders is not very much better than in Giepen or Pennsylvania.

LONDON SICK POOR.

In the parish of St. Pancras the guardians contemplate making considerable changes in their present mode of relieving the sick poor. An efficient matron is to take charge of the workhouse infirmary, connected with which there is to be a separate kitchen. There are to be three medical officers, one for the infirmary, and one each for the men and women patients. Four districts will be appointed and a dispensary established in each, so that there may be no delay in furnishing relief to those who apply.

PROTECTION OF ANIMALS.

It seems a settled principle in our advancing civilization, that dumb animals, which are so essential in our service, should have a portion of our regard, and be as much as possible preserved from unnecessary suffering. Common sense and ordinary feeling would suggest this, and keep any man, one would think, from inflicting unnecessary cruelty on the brute creation. Unfortunately such is not the case, and there is constant need for watchfulness on the part of the Society for the Protection of Animals. This institution has now become international, and the Congress has held its meeting in Paris this year. There were delegates from various places on the Continent, even New York had its representative, and London sent six. Reports were read, and the following questions discussed :— 1st. What amelioration may be made in the mode of transporting animals by railway. 2nd. The best means of slaughtering animals. 3rd. The best means of harnessing oxen ; and 4th, the best means of ameliorating the condition of horses employed in the drawing of omnibuses, cabs, and other public conveyances.

YELLOW FEVER IN MAURITIUS.

In reply to a question in the House of Commons, Mr. Adderley communicated such information on this epidemic as was in possession of the Colonial-office. He said that his last advices were dated May 20, and received July 25. Up to the date named, 7000 persons had perished in Fort Louis and the places adjoining. The governor had instituted enquiries. The General Board of Health "were still considering the subject." How characteristic ! The Colonial Office intended to send out other persons to assist in the enquiry. Should this intention be carried out, the whole affair will, no doubt, be thoroughly sifted, for, of course, the Colonial Office will only send out the most suitable medical man to undertake such a commission.

OFFICERS OF HEALTH.

Our last issue contained the first part of a valuable communication by Dr. Letheby on the "Qualifications and Duties of an Officer of Health." The paper is, in substance, the same as the one read by its distinguished author before the Public Health Section of the National Association for the Promotion of Social Science at the well-remembered meeting in the City of London in 1862. Only very short abstracts have, however, been published in any journal, and even the Transactions of the Association contain but a brief outline. The great and growing importance of the subject, and the fact that by no one has it been thus treated, are sufficient reasons for calling attention to this paper ; while the name of Dr. Letheby is a guarantee for the intrinsic merit of the production. We owe Dr. Letheby our best thanks, that in the midst of his numerous pressing public engagements, he has kindly acceded to our request, and afforded us the means of placing before our readers a detailed account of a subject upon which, in all its branches, he is acknowledged to be a master.

"THE BROADWAY."

We have been favoured by an early copy of the new magazine about to be issued by Messrs. Routledge, and are pleased to find it in every respect equal to promise. The peculiar feature of this new venture—its somewhat international character—will not fail to obtain for it support among the lovers of this class of literature. There are some excellent remarks on criticism, which we should be glad to extract did space permit. We shall be willing, from time to time, to include such passages of its articles as we deem interesting to our readers, amongst our "Gleanings"—a department we have lately instituted. In the meantime, by way of courtesy, and as an introduction to the new comer, we give here the opening paragraph of one of the chapters, selected on account of its brevity :— "'Births, Marriages, and Deaths,' is a common enough heading in all newspapers ; surely it should be Marriages, Births, and Deaths, for man is born to die—that is a natural consequence ; and people are married that others should be born ; therefore, as marriage, in the true relation of things, should always precede birth—being, it is said, made in heaven—so love should ever precede marriage. And thus we shortly reason out the second line of Emerson's quatrain from 'Casella,'

"'Test of the poet is knowledge of love,
For Eros is older than Saturn or Jove.'"

A WHOLE LOAF.

No kind of swindling has been more generally practised than that of giving short weight. The bakers have long practised the art of selling loaves under the professed weight. In fact, a loaf of full weight has long been almost unknown. We are glad to hear that the police have determined to put an end to this imposition. Whatever the outcry raised, and already it has been loud enough, the movement once set agoing is not likely to stop, and, ultimately, bakers will have to acknowledge that short weight, under any circumstances, is really a fraud.

THE CASE OF EDWARD GREENLAND.

A good deal of comment has been excited by the pardon of this man, who was the manager of the Leeds Banking Company, and had been sentenced to a term of imprisonment. It is alleged that a free pardon was given on the ground that his life and reason were in danger from the confinement. The surgeon of the prison did not deem it his duty to have Greenland removed to hospital, and his official report on the case concludes as follows:—

"Under these circumstances he was placed under careful supervision, and precautions were taken during the cold weather against a return of these affections. In consequence his health at first appeared to improve, the only evidence of declining health being a gradual though steady loss of weight, amounting now to 12 pounds, a point of considerable importance in the case of a man 72 years of age. Since he has been placed in closer confinement he has become more depressed in spirits, and his mind less able to bear up under the influence of his late reverses and present imprisonment."

It certainly seems to us that this is a very mild reason

for diminishing a sentence of fifteen months' imprisonment, and remembering that twenty-five of the shareholders of the bank have died prematurely from distress of mind or suicide, and others have lost their reason, we think the public will be inclined to question the propriety of the leniency shown.

CHOLERA IN ITALY.

We have advices from several parts of Italy which seem to indicate that the epidemic is spreading over the Peninsula. Private letters that have reached us from Piedmont speak of a number of fresh towns being invaded. In Rome and some parts of Tuscany it is known to linger; while further south its ravages are very terrible. The Neapolitan provinces, Sicily, and other parts, are suffering considerably. The daily papers have published letters from Malta. The worst feature in Southern Italy is the ignorance of the people, who attribute the disease to poison, and in the most benighted districts are ready to assassinate the authorities, and even the medical men, who they think are in league to destroy them. Tales of this kind are common enough about Messina and Catania. They represent but too faithfully the gross ignorance that prevails in these districts. Nor can we refuse to credit the statement that medical men have feared to go to the relief of some parts, because they know too well the superstition of the peasantry, and were assured that they would only be attacked, and perhaps murdered for their reward.

GREENWICH HOSPITAL.

The waste which attends this noble national institution has again been exposed in the House of Commons. The enumeration of some of the items of expense is more than ridiculous. Fancy eighteen policemen at a cost of £1280 being required to look after 370 old pensioners and 800 school boys. Still more absurd is the whole array of comptrollers, governors, lieutenants, and sub-lieutenants. From what transpired in the debate, it would seem that, with a free choice, no pensioners would remain in the house but the really bed-ridden, they would be easily provided for at Haslar Hospital. The fact seems, then, that we are keeping up the system for the sake of giving away snug births to the tune of £30,000 or £40,000 a year. With the claims of men who have really served their country let us be just, however heavily taxation may press. But if we are to be generous at all, let it be towards them, not to an army of placemen, whose only duty would seem to be to absorb money that would be better expended in other ways.

The relative value of Queen Mary's and Queen Anne's quarters at Greenwich Hospital has also been subject of debate in the House. We have so fully given the arguments on each side on several occasions, that there can be no need to repeat them. We find, however, that the greatest amount of testimony has gone against the Dreadnought authorities, and as they were formerly willing to submit the point to arbitration, we are rather surprised at their repudiating that mode of decision when it was pronounced.

We cannot but feel flattered that the notion of establishing a medical college at Greenwich Hospital, first broached in this journal, has been introduced to the House of Commons. It is plain that abundant opportunity exists of creating a fine hospital, with a complete medical school, at which special training for the navy could be efficiently carried out. Why should not a naval medical school rival that of the sister service?

THE BALANCE SHEET OF THE BRITISH MEDICAL ASSOCIATION.

The financial statement submitted by the Council at the First General Meeting, although it passed without comment, revealed a condition of the funds which would have afforded the best argument in favour of the recent changes in the administration of the journal. The results of last year's management are represented by the figures as singularly unfortunate, for the Association started with £318 in hands and closed its books with a debt of £503; in other words there was a dead loss of £821 on the year's operations. On going into the detail of the account the cause of this disastrous result is evident in the fact that the advertisement income, from advertisements and sales, amounted only to £435, deducting the canvasser's commission from the gross income of £582. As the income from the subscriptions to any journal seldom does more than pay the printing expenses, and did not do so in the present instance, it is easy to understand that such a small advertisement income should have been quite inadequate to meet the expenditure of the large staff maintained by the Association. The next balance sheet will, it is to be hoped, show a more satisfactory result of the new management.

VACCINATION FROM THE COW.

The discussion so vigorously maintained in the Academy of Medicine of Paris as to the transmission of syphilis by vaccination from impure sources of lymph has resulted in a movement, which has been now largely adopted in Paris, for vaccination directly from the cow. M. Depaul has presented to the Academy a report of 611 such vaccinations, the results of which have been eminently satisfactory. The feverish symptoms supervening on the operation from the cow are sharper, and the pustules larger than in vaccination from the human subject, but not to an extent to cause any serious inconvenience, while the proportion of successful cases was 61·82 per cent. from the cow, and 60·53 from the human subject.

THE REPORT ON HYPODERMIC INJECTION.

The Committee of the Royal Medical and Chirurgical Society, have presented their report on this subject. The result of their investigations is not very conclusive although they have experimented with a great variety of agents—Aconitine, Morphine, Atrophine, Strychnine, Quinnæ Conia, Podophyllin, Iodide of Potassium, Battley's Sedative, Prussic Acid, Colocynth, Aloes, and the Calabar Bean. The decisions they arrive at are as follows:—

1. That, as a general rule, only clear neutral solutions of drugs should be injected, for such solutions rarely produce local irritation. 2. That whether drugs be injected under the skin, or administered by the mouth or rectum, their chief physiological and therapeutical effects are the same in kind, though varying in degree. 3. But that symptoms are observed to follow the subcutaneous injection of some drugs which are absent when they are administered by the other methods, and, on the other hand, certain unpleasant symptoms which are apt to follow the introduction of the drugs by the mouth and rectum are not usually experienced when such drugs are injected under the skin. 4. That, as a general rule, to which, however, there may be exceptions, clear neutral solutions of drugs introduced subcutaneously are more rapidly absorbed and more intense in their effects than when introduced by the rectum or the mouth.

5. That no difference has been observed in the effects of a drug subcutaneously injected, whether it be introduced near to, or at a distance from, the part affected. 6. That the advantages to be derived from this method of introducing drugs are—(*a*) rapidity of action; (*b*) intensity of effect; (*c*) economy of material; (*d*) certainty of action; (*e*) facility of introduction in certain cases; (*f*) with some drugs the avoidance of unpleasant symptoms. This plan, therefore, is most likely to be adopted where very rapid and decided effects are required from drugs which are operative in small doses.

THE THIRTY-FIFTH ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION, IN DUBLIN.

The proceedings which commenced on Tuesday, August 6, within the buildings of Trinity College were well attended, and both the retiring President, Dr. Waters of Chester, and the President-elect, Dr. Stokes, received quite an ovation from the large body of the profession assembled to hear their addresses, both of which appeared *in extenso* in our third edition last week. Dr. Waters was appointed permanent Vice-President, on the motion of Dr. Paget, who passed a very high eulogium on the invariable ability, courtesy, and hospitality displayed by that gentleman during the time he had been connected with the Association. Dr. Waters having thanked the meeting for the honour they had conferred upon him,

THE REPORT.

Mr. Watkin Williams, the Secretary, proceeded to read the annual report. One of the clauses, and the only one which produced discussion, being—

"That eight members, to be elected by the registered members of the profession, be added to the 'Medical Council,' four for England and two each for Ireland and Scotland, and that the election be by voting papers distributed and collected by the registrars of the Medical Council in the respective countries."

Sir Dominic Corrigan moved the adoption of the report. It was so plain that it required from him no explanation, and he thought he might say it required no defence. Therefore, without further observation, he would move the adoption of the report.

Dr. Radcliffe Hall seconded the motion.

Dr. Stewart wished to use the strongest arguments he could against the proposed increase in the number of representatives to the Medical Council. The number—twenty-four—was already quite large enough, and the expense attending it sufficiently heavy for the profession to bear. How the additional expense was to be met, he did not pretend to know. If more were added to the committee, he was of opinion that it would be positively more unworkable than at present, and therefore he strongly objected to the proposal; but he thought they could get representation—substantial representation—in the Medical Council without adding more members. He would therefore move the following amendment:—

"That this meeting, while deeply impressed with the propriety and justice of direct and substantial representation of the general body of the profession in the Medical Council, considers it highly inexpedient that the number of the Medical Council should be increased."

Dr. Markham, in seconding the amendment, said, if that report was carried, he believed the Association would be binding itself to an impracticability. In fact, the proposal would lead to an impossibility of the proper management of business. The arguments upon which the proposal to add eight members to the Medical Council was grounded, he confessed he was unacquainted with. He should say that his opinion was diametrically opposed to the statement that the profession was not well represented in the Medical Council.

Mr. Husband could not understand the arguments of Drs. Stewart and Markham. They admitted that the profession should be more adequately represented in the Medical Council, and yet objected to the proposed addition. He thought that they had not grappled with the question, but had advanced arguments they were unable to maintain. In his opinion the interests or requirements of the general body of practitioners who resided in the agricultural districts, or the manufacturing districts—the active, hard-working, general practitioner—could not be properly attended to or faithfully represented by the nominees of the Crown or the professors of corporate bodies, almost wholly unacquainted with them. Persons who understood the requirements of the general body of the profession wished to have a voice in the proceedings of the Medical Council; then, and not till then, could it be said that the profession in general was properly supported.

Dr. Waters, who supported the adoption of the report, said the course pursued by Drs. Stewart and Markham reminded him of what a great statesman connected with the University they were then in had said—"That it was extremely easy to raise objections, but it was not so easy to apply remedies."

Dr. Lankester said it might be easy to withdraw some of the Government members of the Council, or reduce the number of professors of colleges belonging to it, in order to meet the difficulty.

The amendment was then put and lost, after which the adoption of the report was carried.

On the motion of Dr. Sibson, Mr. Williams was unanimously re-elected General Secretary for the ensuing year.

THE MEDICAL BENEVOLENT FUND.

The Secretary then read the annual report of the Medical Benevolent Fund, of which the following is an extract:—

"In again presenting the yearly account of the operation of the Fund, the committee do so with increased confidence in its usefulness. During the year the sum of £1035 has been distributed in grants for the relief of temporary distress, the largest amount hitherto given in any single year, the number of cases being one hundred, and thirty annuitants are now maintained by the permanent investments. The amount of suffering brought to the knowledge of the committee is but faintly indicated in the brief abstract of cases given with this report, and it should be remembered that this fund stands alone in supplying without loss of time the pressing necessities of members of the profession who are not of an age to be eligible for annuities, but who, from ill-health, physical disability, or misfortune, are in difficulty and distress. In addition to the care taken to proportion the grants to the urgency of the case, every endeavour is used to make the relief as effectual as possible by committing the sum voted to the hands of a member of the committee or some medical man for distribution; and at times a permanent provision is secured by the initiation of a subscription, which serves as a stimulus to the efforts of friends."

On the motion of the Rev. Dr. Bell, M.D., seconded by Dr. Seaton—

"That it is inexpedient to make such extensive changes in the form and conduct of the *Journal* as have just been made, without the consent of the members assembled at an annual meeting."

An animated discussion ensued, the mover and seconder severely condemning the alterations that had been made, maintaining that it was neither so convenient in size nor so scientific in character as in its late form.

The motion having been put from the chair, was negatived.

The meeting then adjourned.

THE CONVERSAZIONE OF THE OBSTETRICAL SOCIETY.

The *conversazione* at the Rotundo was a very brilliant affair, and attracted an immense assemblage. Every shade and grade of the profession seemed to be represented. Sociability and harmony were the order of the evening, from the first arrivals at nine o'clock. The large room in the Rotundo was thrown open for the promenade, and the refreshments were served in the adjoining apartment.

Wednesday, August 7.

The proceedings of this day commenced by a public breakfast at the Exhibition Palace, which was attended by more than two hundred members of the Association, at half-past eight o'clock a.m. At 9.50 the committee on Observation and Registration of Disease met in the Museum Buildings, Trinity College, and remained for some time in conference. At ten o'clock the meeting of the new General Council was held, Dr. Sibson presiding. The second general meeting took place shortly after eleven o'clock in the Examination Hall, to transact some business undisposed of the previous day, and to hear the address by Sir Dominic Corrigan, Bart. There was a large attendance of members of the profession representing the three countries. Professor Stokes, the President of the Association, occupied the chair.

Sir Dominic Corrigan, during and after the delivery of his

eloquent address in Medicine, which will be found in another column, was loudly cheered; and on resuming his seat, Professor ACLAND moved—

"That the cordial thanks of this meeting be given to Sir Dominic Corrigan for his able and valuable address."

He was sure they all felt that that address was of great value both to the profession and the public. Sir Dominic had most graphically brought under the notice of the council the difficulties under which they laboured in discharging their duties towards the public and the profession in the matter of medical education, and also the difficulty of combining at once solid advantages to the profession and solid benefits to the public for whom they ministered in the form of a technical medical act. The address would be perused by the profession and the public with great interest and satisfaction, and Sir Dominic Corrigan well deserved their warmest thanks for delivering it (applause.)

Sir JAMES SIMPSON, Bart., who seconded the motion, said he had never listened to an address which was characterized by more tact and energy and eloquence than Sir Dominic Corrigan's. Still, while he agreed with most, he did not agree with all, that Sir Dominic had laid down. He (Sir J. Simpson) belonged to a university that was looking up, instead of looking down, as Sir Dominic had put it. Even before the Medical Act passed, the examination there was good, and since then in many parts of Scotland the examinations had been gradually—he might say enormously—increasing. The University of Edinburgh the other day passed ninety-two graduates. How long were they examined? Each was examined for a time that altogether amounted to fifty hours. Sir Dominic Corrigan had laid down a number of rules for examination. Well, there were twenty-five members of the Council, and he would suggest that they should first pass the examination to see if they would like it. He ventured to say that if the full examination was carried out strictly, there would be twenty-four empty chairs round the President (laughter). Even Sir Dominic himself would scarcely pass in botany (renewed laughter).

The resolution was then put and carried unanimously.

The members then adjourned to the new Museum Building for the purpose of hearing Mr. Rumsey's address on "State Medicine." This address was characterised by great ability and deep research, the discussion that followed proving the interest manifested in the subject thus ably brought before the meeting. We regret the crowded condition of our columns this week, and the number of valuable contributions and papers we have standing over, preclude the possibility of our placing this address before our readers.

The discussion ended, which, for the same reasons, we are unable to give.

Dr. STEWART proposed a resolution—

"That a committee of the Council direct their attention to the amendment of the sanitary laws, to co-operate with the Social Science Committee on the subject."

He urged the making of general exertions to promote the objects in view.

Dr. SIBSON seconded the resolution, and bore testimony to the manner in which Mr. Rumsey had devoted himself to this important subject.

Mr. RUMSEY moved a resolution—

"That the Association express its decided approval of Dr. Farr's plan for the appointment of registration medical officers, and pledge itself to support that measure as the initiative step to a national organisation for the purposes of State Medicine."

These resolutions were unanimously adopted.

Dr. BEATTY, as President of the Midwifery Section, delivered an address, in which he gave an interesting historical sketch of the Dublin lying-in-hospitals. He also gave a cordial welcome on behalf of the profession in Dublin to their distinguished and numerous friends from the sister country who had honoured them by their presence. He hoped that the British Medical Association would have no reason to regret that the meeting of 1867 was held in the metropolis of Ireland.

The following papers were also read during the day—

Dr. HENRY BENNETT—On the subject of "Pulmonary Consumption," in which he treated of cases that led to this disease, and to the course of treatment usually adopted.

An interesting discussion followed, in which several members took part.

Dr. M'CALL ANDERSON—On a Case of Ephidrosis Cruenta, or Bloody Sweat; with Remarks.

Sir HENRY THOMPSON—Considerations suggested by the Study of One Hundred Cases of Stone in the Bladder of the Adult, recently Operated on.

Dr. C. FLEMING—On a Case of a Fibro-calcareous Tumour of the Uterus, communicating with the Bladder.

GEORGE SOUTHAM, Esq.—On Three Cases of Spontaneous Fracture of Urinary Calculi in the Bladder.

Sir J. Y. SIMPSON—On the Cephalotribe.

Dr. RINGLAND—Cases illustrating the Use of the Cephalotribe.

Mr. BRAXTON HICKS exhibited a cephalotribe, and explained its uses; after which the meetings in the several sections adjourned till nine o'clock, when the various members of the Association were received by the President and Fellows of the King and Queen's College of Physicians, at a grand *conversazione*, held in the magnificent rooms of the College in Kildare-street. For three hours a constant stream of visitors flowed in, till at one time not only were the halls and library filled, but the grand staircase was most extensively occupied by those unable to gain even standing-room elsewhere.

During the evening, the President, Dr. STOKES, conferred the honorary distinction of Fellowship of the College on the nine gentlemen, whom he named in his observations:—Having congratulated the College on the fortunate state of events by which, within a few hours of the bi-centenary of the institution, they were entertaining the British Medical Association, which they all so much admired—the objects of which were to elevate their common profession—an Association having followed two definite objects—the path of science on the one hand, and on the other the path of love, respect, and confidence, induced by mutual friendship and intercommunication of the members of the profession. It was a matter of enormous pride to learn that that College of Physicians had recognised the importance of the visit of this great body for the first time in Ireland, and in doing so did him the honour of placing him during the year of the intended visit in the chair of the College. Of all the circumstances of his professional life this had been the most gratifying to him, and the most honoured of all. The College was originally commenced during the life of Charles I.; but it received its first Charter from Charles II. Aug. 8, 1667. They were now, as he had said before, within a few hours of the bi-centenary of the College, and they believed that could not have been better marked than by the circumstance that within the walls of the College as at present, and recently erected, thanks to the energy of the late President, Sir Dominic Corrigan, they received the members of the British Medical Association. This College, which originally formed part of the University of Dublin, was determined to follow the example of that great seat of learning, which to-day would confer its highest honour on some of the members of the Association. As a child of Trinity College, the College of Physicians was not forgetting its traditions in doing honour to strangers. Therefore it was determined to elect a certain proportion of the Association into its list of honorary Fellows. This to him, as temporary head of the College, was a gratifying circumstance, and he begged to assure them that there was not a single Fellow of that College, or a single Licentiate, numerous though they were, who did not heartily and faithfully participate in the feelings which he had expressed. They were determined on honouring nine of the most distinguished physicians; and when he said honour he should have added that it was mutual. It was an honour to receive the diploma from the College of Physicians, and it was an honour to the College to have such recipients on its roll. The latter, he should say, was by far the greater. Those who were to be so honoured were the following:—Professor Hughes Bennett, of Edinburgh, one of those men of progress who sought to place medicine on some secure foundation. Dr. Waters, the ex-President of the Association. The same principle that actuated the heads of the Dublin University were adopted here, both at the same time wished to honour the individual for his scientific merits, and to honour the association in its general character. They had Dr. Falconer, whose contributions to medicine as well as those of Dr. Waters, had done so much credit to the British Association; they had Dr. Stewart, of London, the zealous worker in the great field of sanitary science, and he would say the representative in England of that branch of research which was, day after day, assuming greater proportions; they had Dr. Markham, whose high tone of feeling had done so much to uprise the profession; they had two members who were unavoidably absent—Dr. Gream, of London, and Mr. Spencer Wells; next, they had the celebrated Professor Polli, of Milan, a man also remarkable in the progress of medicine; and, though last not least,

that arduous worker in the promotion of physiological pathology, Mr. Jacob L. Clarke.

The applause having subsided,

Dr. HUGHES BENNETT briefly returned thanks, and the proceedings terminated.

THURSDAY, AUGUST 8.

The address in the Surgery Section was listened to in the Examination Hall of Trinity College by a very large and enthusiastic audience, who manifested their appreciation of the eloquence and ability of Professor Smith by frequent bursts of applause. After the conclusion of the address, which we publish in another column,

Professor SYME expressed the satisfaction he felt in listening to an address which was not one of abstract ideas and vague sentences strung together, but Dr. Smith had directed their attention to a special subject of surgical practice, and brought to bear upon it the lights of his long and large experience. He hoped that what had fallen from Dr. Smith would not be without its results to the profession at large. He begged to propose what he was sure they would all most cordially agree in, namely—

"That the cordial thanks of this meeting be given to Professor Smith for the very able and valuable, and—I shall beg leave to add—most eloquent address."

Mr. WILLIAM BOWMAN, F.R.S., hoped in seconding the resolution, he might be permitted to say a few words. He was sure they would all agree with him that few had ever listened to an address more eloquent. He should say, as an exposition of the tone and spirit which ought to influence all as members of the Medical Profession, than that which they had listened to, to say nothing of the very interesting practical remarks which had formed the staple of the address. Professor Stokes said a few words to the effect that thirty years ago an eminent member of the Profession spoke very disparagingly of the state of surgery at that time. He remembered that just thirty years ago, spending a few weeks in Dublin amongst the hospitals and museums, and he would say that from what he saw there in the clinical wards of Collis, of Cusack, of Robert Adams, and of Porter, and in the splendid museums, which were then already great and noble, and which are now infinitely greater, he saw nothing to bear out the character of that lowering remark. He could not forbear, remarking on the excellence of those observations which were made with reference to the neglect of the classic and older authors of our Profession, not only by students, but by those who by their more mature experience are more able to appreciate the value of the remarks of those older writers. We did not see anything of the ordinary minds of past centuries. We saw amongst ourselves, no doubt, the whole of our present contemporary literature, and in that there was much, no doubt, to be regarded; but he did not believe at all that the present day was more prone to the weaknesses and follies which were so eloquently exposed than past ages. He believed that if they were then living we should have had just the same cause for complaining that much was to be deprecated in the practice of the Profession, and which belonged not so much to the Medical Profession as to human nature itself. It must always be that of those who have not yet obtained experience, and who are anxious to acquire notoriety, some must act upon lower motives than others; and he thought they must look charitably always at the efforts of younger men who were endeavouring to promote science, and at the same time to further their own prosperity and progress in the world. They must both look charitably and endeavour themselves to act upon a higher standard. He would not detain them longer than by making those very few remarks, which arose in some measure out of the eloquent and burning address which they had heard, and which they should, no doubt, have the pleasure of reading and of doubly and trebly enjoying.

After a few complimentary remarks on the ability displayed by Dr. Smith in his address from Dr. Wharton, Professor Acland, and the President, the resolution was put and carried with acclamation.

In this section during the day, papers were read by

Dr. GEORGE BUCHANAN.—On the treatment of Elephantiasis by Ligature of the Main Artery of the Limb; with a Case in which cure was effected by Ligature of the External Iliac Artery.

Dr. RAWDON MACNAMARA.—Ligature of the Femoral Artery according to the Plan of the late Professor Porter.

Dr. MAPOTHER.—Treatment of Aneurism; advantages of completely arresting the Current through the Sac.

Mr. J. Z. LAWRENCE.—On a Case of Traumatic Aneurism of the Orbit, in which the Common Carotid Artery was successfully tied.

Dr. W. MURRAY.—Report on Two Cases of Aneurism cured by the rapid Pressure treatment.

The discussion on the papers read was taken at the four o'clock P.M. sitting, and were taken part in by a number of gentlemen, including Sir James Simpson, Dr. Macnamara, Dr. Byrne, Mr. Meade, Dr. Mapother, Dr. Geoghegan, &c.

Dr. MORGAN invited Professor Pirrie to give a practical demonstration of acupressure, which would be better than any lecture.

Professor PIRRIE said he should be most happy to do so.

It was then arranged that gentlemen should meet Professor Pirrie at the College of Surgeons at seven o'clock, on Friday morning, for that purpose.

In the section devoted to contributions to and discussions in medicine, a paper was read by Dr. S. Gordon, on "Cerebro-Spinal Fever." This contribution produced a very lengthy discussion, and much valuable information on the subject was adduced.

Papers were also read by:—

Dr. LEARED.—On the successful use of arsenic in certain painful affections of the stomach.

Dr. POLLI (Milan.)—Treatment of Zymotic Diseases with Sulphites.

Dr. PATON.—On researches on the action of the heart.

Dr. GEORGE H. KIDD.—Exhibited a cephalotribe; with remarks.

Dr. GREENHALGH.—Cæsarean section.

Dr. AVELING.—Pelvi-uterine mensuration, by means of combined sounds.

Dr. PROTHEROE SMITH.—To exhibit inhaler, speculum, and other instruments.

Dr. PROTHEROE SMITH.—On the mode of detecting impurities in tetra-chloride of carbon.

At three o'clock Professor HUGHES BENNETT, M.D., delivered his address, which was on the subject of "The Effects of Mercury." He stated that in an address delivered last year at Chester he urged upon the Association the propriety of doing something in its collective capacity towards solving one or more of those doubtful points in practical medicine connected with the action of particular medicines in the treatment of disease. A sum of £25 was granted for the purpose, and a committee appointed, under his direction, and they decided upon investigating the action of mercury in animals. The learned professor's paper was of a purely scientific and medical character, and detailed the results of various experiments made on dogs and other animals, with a view to throwing light upon the action of mercury.

Dr. WATERS, Ex-President, pointed out that the researches in which the committee presided over by Dr. Hughes Bennett had engaged were of so important a character that they ought to be persevered in. It was impossible that this could be done unless the requisite funds were provided, and he, therefore, moved—

"That this meeting approves of the grant already made by the Council, and desire that the Committee may be yet further assisted by such grant as the Council may consider themselves justified in giving."

Dr. RADCLYFFE HALL seconded the resolution, which passed mously.

Other gentlemen expressed their concurrence in the necessity of raising a fund to defray the cost of the investigation, and provide a suitable remuneration to the gentlemen who were obliged to devote time, labour, and scientific knowledge to them; and

On the motion of Dr. MARKHAM it was resolved that the Committee of Council be instructed to raise a fund in what way they may think best for the purpose.

Rev. Professor JELLETT exhibited the Saccharometer, his own invention, of which he gave an admirable explanation.

Dr. LOCKHART CLARKE read a paper on "The Pathology of Loco Motor Ataxy," and Dr. Bateman on "The Localisation of the Faculty of Speech." Some extraordinary cases of the sudden loss of speech and the intellectual results that followed were given during the discussion that followed.

THE COMMENCEMENTS.

At an extraordinary meeting of the Members of the Senate of the University held in the Examination Hall of Trinity College, Honorary Degrees in Medicine were conferred on the following distinguished members of the profession:—

Acland, Henricus Wentworth, Soc. Regiæ Soc. Med., Prof. Reg. Univ. Oxon.

Bowman, Gulielmus, Societatis Regiæ Socius.

Paget, Georgius E. Lector Linacriensis in Med., Univ. Cantab.

Rumsey, Henricus Wildbore.

Sibson, Franciscus.

Syme, Jacobus, Chirurgiæ Professor Edinensis.

Simpson, Jacobus Y., Baronettus.

Teale, Thomas Pridgin, Soc. Regiæ Socius.

The Right Hon. Judge Keating, as Provice-Chancellor, presided.

Dr. STOKES, in introducing Dr. Acland, said—Right Hon. Provice-Chancellor and Members of the Senate, I have to present to you Dr. Henry Wentworth Acland, Regius Professor of Medicine in the University of Oxford, Fellow of the Royal Society, and many other learned bodies, and a gentleman who has done great things for the profession by his genius. It is to his deeds that we owe the great establishment for the cultivation of the physical sciences in Oxford, and in a great measure the introduction of those physical sciences into the arts course in general at that great seat of learning.

In introducing Mr. Bowman, Dr. STOKES said, the name of that gentleman had been long known in the annals of science as a great physiologist. He also was a Member of the Royal Society, and he was a gentleman of excellent parts, and admirable tastes, and unspotted character.

Dr. Paget, Professor of Medicine in the University of Cambridge, was next introduced to the Senate by Dr. STOKES, who said that Paget's contributions to medical science entitled him to the gratitude and respect of all who cultivated or loved learning.

Mr. H. W. RUMSEY was next on the list.

Dr. STOKES said that Mr. Rumsey had for many years devoted all his spare time to the furthering of the cause of State Medicine, a subject which was assuming very great importance now throughout the civilised world, and more especially in England. His writings had received the highest attention, and were considered by his own profession, and the profession of the law, as likely to lead to the best possible results.

Dr. STOKES next introduced Dr. Francis Sibson, of London, who was, he said, a Graduate of Medicine in the London University. He was the President of the Council of the British Medical Association, which that University has done so much to honour. As he was President of the Council of that Association it was hardly necessary for him (Dr. Stokes) to say another word in his behalf. He was member of many bodies who were employed by the Government in all matters connected with sanitary science, and he had been lately Secretary of the Committee for Promoting Uniformity in Medical Nomenclature, which would greatly subserve the cause of the public registration of deaths and the general health of the country.

Dr. STOKES said the name of Sir J. Y. Simpson was so well-known that he should abstain from making any observations respecting him. He presented him as one of the greatest benefactors of suffering humanity.

Dr. STOKES said he had then to introduce Professor Syme of the ancient University of Edinburgh, and in doing so he would only borrow the words of one of their own professors, which were uttered a short time ago in that hall, that "he was a gentleman to whom might be attributed that he bore the sceptre of surgery in Edinburgh."

Dr. STOKES said he had next to present to the Provice-Chancellor, and to the University, Mr. Teale, whose writings had obtained for him a world-wide reputation in the healing art. Mr. Teale might safely be said to be one of the most leading surgeons in England, and he might add to that one of the leading surgeons in the world.

As each gentleman came forward to receive the honours from the hands of Judge Keating, the greatest enthusiasm on the part of the Fellows, and Members of the profession assembled was displayed.

The Royal College of Surgeons also bestowed honorary diplomas of Fellowship in the course of the afternoon. Two recipients, however, Professors Syme and Bowman were the only members of the profession on whom the honour was conferred.

On presentation of the same by the President, Dr. Adams, (the seals being enclosed in handsome silver cases),

Mr. SYME replied in a suitable speech, expressing his entire satisfaction at the great efficiency and celebrity of the Dublin School of Surgery. Thirty years ago, when he came here first, he formed the highest opinion of the School, and the progress of years had not induced him to change it.

Mr. BOWMAN made a speech similar in effect, and the proceedings terminated.

FRIDAY, AUGUST 9.

This was the last day of the meetings, the whole four sections being carried on simultaneously in different parts of the building. As there were a great many papers to be read, and much business to be got through, but little time was allowed for discussion.

Dr. MAPOTHER read a paper on "The Topography of Cholera," in which he sought to show the dependence of that disease upon the dampness produced by old streams and pools in Dublin, London, Liverpool, and other cities. He also adduced evidence to show that the poison of cholera was of cryptogamic origin, and arose from a parasitic plant, a conclusion which was supported by the analogy of what had been found true of other zymotic diseases.

Dr. P. C. LITTLE also read a paper on the same subject, the views taken by the latter gentleman differing almost entirely from the former. He maintained that the disease was a contagion, probably communicated through the medium of water, air, or food; that its development and diffusion depended upon certain atmospheric, hygienic, and bygienic conditions; that the chief effects of this condition were produced upon the sympathetic system, especially those presiding over the gastro-intestinal tract; that these nerves were powerless to discharge their functions while in contact with the morbid products of the diseased; and that the proper treatment was, therefore, to remove those products and give tone to those nerves.

A somewhat lengthy discussion took place on the relative merits of the two papers, in which the following joined:—Dr. Moore, Dr. Hewitt, Dr. Davis, Dr. Wharton, Dr. Martin, of Portlaw; Dr. H. Kennedy, Dr. Protheroe Smith, Dr. Steele, of Liverpool; Dr. Popham, Dr. Day, of Stafford; Dr. R. Byramjee, Assistant-Surgeon, Bombay Army; Dr. Camps, London; Dr. Shinkwin, and Dr. Tibbets, of Bristol.

Dr. LORY MARSH'S paper on "Idiopathic Abscesses of the Brain," was next read by Dr. Jacob, Dr. Lory Marsh being absent through illness.

Professor GAIRDNER'S communication was on "The Fever Dens of Glasgow," and which, unfortunately, existed in every large town. He spoke of the means employed for the better accommodation of the poorer classes in Glasgow, and mentioned that whenever fever commenced its ravages in that city, hospital carriages were immediately put in use, the sick taken from their wretched hovels, and their clothes sent to wash-houses erected for the purpose, for disinfection. He recommended that everything should be done to enlist the sympathies of landlords of house property in any arrangements that were made for its sanitary improvement.

Dr. ACLAND said it was intolerable that in any town whatsoever, at the present day, any habitations should be allowed to be erected which were unfit for human habitation. There were parts of the east end of London in which the mischief in question could not be equalled by anything existing either in Glasgow or Edinburgh.

Dr. MAPOTHER mentioned that the Corporation of Dublin lately erected in this city, at a cost of £303, a disinfecting-chamber on the plan of that in Liverpool, which had succeeded so well in Liverpool. In this the temperature was ordinarily raised to 300°, and frequently 350° F.

The other papers communicated in this section were by Dr. Joseph Lalor, on Epidemic Fever; and two by Dr. Kennedy, on Types of Fever, and on Puerperal Purpuric Fever.

In the Section on Physiology, the following papers were read:—

Dr. Lockhart Clarke, on "The Pathology of Locomotor-Ataxy;" Dr. Bateman, on "The Localisation of the Faculty of Speech;" Dr. Sibson, on "Movements, Rhythm, and Sounds of the Heart," and on "The Cardiograph;" Dr. Hayden, on "The Pathology and Diagnosis of Inorganic Mitral Regurgitant Murmurs;" Dr. Cruise, on "The Endoscope," with experiments.

Dr. MacDonnell exhibited a Microspectroscope; Dr. O'Leary on "The Thermal Value of Food, and on the Application of Food for Calorifying Purposes and Work Done;" Dr. Cameron, on "The Assimilation of Gelatin;" Mr. Tichborne, on "The Nature and Examination of the Organic Matter found in Potable Water;" Dr. Z. Johnson, "A Suggestion for the Sanitary Improvement of Towns and Private Dwellings;" and "A Case of Singular Cardiac Derangement."

In the Section on Surgery, papers were read by—

Dr. JULIUS ALTHAUS—"Electrolysis of Tumours."

Mr. M. H. COLLIS—On "The Treatment of Tumours by Electricity."

Dr. MORELL MACKENZIE—"On the Use of Electric Cautery in the Treatment of Laryngeal Growths."

Dr. HINGSTON (Montreal)—"An Operation for the Relief of Deformity from Disease of the Hip-joint."

Mr. JOSEPH LISTER—"On the Antiseptic Principle in the Practice of Surgery."

SECTION D.—MIDWIFERY.

Dr. BEATTY presided.

Papers were read by—

Dr. DENHAM—"On the Use of Ergot of Rye."

Dr. HARDY—"On Hysteria Treated by Strychnia."

Dr. F. CHURCHILL—"Granular Endometritis."

Dr. EVORY KENNEDY—"Extra-uterine Fœtation, detected at an Early Period of Gestation."

Dr. J. A. BYRNE—"Case of Purpura Hæmorrhagica.

Sir J. SIMPSON, Bart., exhibited a variety of instruments, on which an interesting discussion followed.

FIFTH GENERAL MEETING.

At five o'clock the closing general meeting of the Association was held in the New Museum Buildings.

The chair was taken by the President, Professor Stokes.

Dr. WATERS, ex-president, said—Mr. President and Gentlemen, at the close of the thirty-fifth anniversary of the British Medical Association—the meeting which is now at an end—I am able justly to say that, though great things were expected, the results have far transcended our most sanguine expectations. The resolution entrusted to me is, that the cordial thanks of this meeting be given to the writers of papers. It does not devolve on me to say one word in regard to the addresses in medicine and surgery delivered by Sir Dominic Corrigan and Professor Smith. They have already, in the Examination Hall, met with the warm approbation of the Association, as well they might, for on no previous occasion has such energy characterised the addresses on the other side. The thanks I have to propose are to the writers of papers. On this occasion the communications have been more numerous than on any previous meeting of the Association. Not only have they been more numerous, but on no occasion have they attained a higher degree of interest, and on no occasion has the attendance at the reading of papers been so general. And, owing to the division into sections, an amount of work has been got through which has previously been found impossible.

Dr. MARKHAM seconded the resolution, which was carried unanimously.

Dr. SIBSON then said that it was his pleasing duty to move a vote of thanks to the Provost and Senior Fellows of Trinity College for the admirable arrangements made by them for the various meetings, general and sectional, and the generous hospitality shown by them. He was quite certain he had but to read this motion for an unanimous expression of true feeling on the part of that meeting to be shown. There could be no question, as far as he knew, with the exception of their meetings at the two sister universities of England, that there had not been a meeting at which any one institution afforded such facilities for the work of the Association, and at the same time bestowed upon them such splendid hospitality. In fact, he could not but feel that much of the great and signal success of this meeting was to be attributed to the fact of their labours having been centered in this University. But it is not only the fact of this being done by the Provost and Senior Fellows, but it is the mode and spirit in which they have done it—the mode in which they have thrown open the whole of this magnificent institution to them, and carried them as if they were of themselves into that most honoured body, who received and conferred upon them the highest degree of medicine. He could but express the deepest possible feelings of gratitude which animated his mind, and, if he might be excused for mentioning a personal reason for that, it was that they had done him the favour of showing him the name of his father, written down in the list of students in that University in 1795. It might be right or wrong to mention that, but it showed how the great men who had charge of that place thought of their sympathies, although they were merely there as casual visitors. He entertained the warmest sense of the goodness and kindness of the heads of that institution, and, therefore, he had great pleasure in moving that vote of thanks.

Dr. STEWART, in seconding the resolution, said that he had scarcely anything to add to what his friend, Dr. Sibson, had said. He regarded it as of the greatest importance for their young and vigorous institution to be brought into contact and friendly relations with the vigorous and venerable institutions of the past. They felt that very much when they last met at Cambridge—the same sentiments prevailed at Oxford, and now that they had met in that great institution of Ireland they felt it more strongly than ever, for they felt that that meeting would be one of the most remarkable meetings in the existence of the Association, and that they would from that time take a great start forward, and he hoped that the benefits would be equally extensive to the Profession in Ireland.

The resolution was unanimously adopted.

Dr. FALCONER said it was individuals who gave the impress to the operations of committees. There was one individual in particular who gave expression to all their good wishes, and without whose aid and kindly co-operation their meetings, on the whole, would not have been brought to so successful an issue as they had been. He believed they were greatly indebted to Professor Haughton for having given such perfect expression to the wishes of the authorities of the College, that no person was brought into contact with him without receiving from him every assistance in his power, which was rendered in an admirable and affectionate manner. The resolution he had to propose was: "That the special thanks of the meeting be given to Professor Haughton, Medical Secretary to the School of Physic, for his unwearied exertions in promoting the success of the meeting."

Mr. CEELY, of Aylesbury, seconded the motion, which was adopted.

The PRESIDENT said Dr. Haughton had devoted much labour in the promotion of these meetings.

Rev. Dr. HAUGHTON said he felt highly complimented by the vote which had just passed, on his own behalf as well as on behalf of the Provost and Senior Fellows of the College, who did him the honour of asking his assistance in this matter. They had on the board gentlemen who had acquired a reputation in various branches of literature and science second to none in the world. They felt that the Medical Association was working to carry out the ends for which Queen Elizabeth founded this college. He did not know what was in store for the college, but as a Tory he did not like changes; but whatever changes might come about, and whatever the aspect of their ancestors in that respect might be, he trusted that when an educated and cultivated body such as the British Medical Association might come to Dublin, the Provost and Fellows would permit none in Dublin to take precedence of them in the matter of a welcome. He was requested by the Provost, Dr. Lloyd, to express to the Association his extreme regret that his almost necessary absence from Dublin rendered it impossible for him to maintain the hospitality which had always characterised the Provost's House.

Dr. BEATTY said he felt pain in bidding this Association farewell; but everything should have an end, and it was tantalizing to have only a short week's enjoyment of the friendship of men who were respected wherever the English language was spoken. The best of friends should part, and in that parting he looked forward to a happy meeting at Oxford. He moved the thanks of the meeting to Mr. Tufnell, Dr. Cruise, and Dr. William Stokes, for their very valuable services as honorary secretaries to this annual meeting. He bore testimony to the great exertions made by these gentlemen.

Dr. HAMILTON seconded the motion, which was unanimously agreed to.

On the motion of Dr. CHARLTON, seconded by Dr. SIBSON, a vote of thanks was also passed to the Presidents and Secretaries of the various sections for their efficient services. In seconding the motion, Dr. Sibson said he was happy to know that the sectional system, which had worked so well, originated in Dublin.

On the motion of Mr. WILLIAMS, Secretary, Dr. Stokes left the chair, and Dr. Sibson was called thereto.

Dr. ACLAND then moved "That the very warmest thanks of this meeting be given to Professor Stokes, Doctor of Medicine and Doctor of Civil Law, for the very able and courteous manner in which he has conducted the business of this annual meeting." He spoke of the great scientific acquirements of Dr. Stokes, and also of his courteous conduct towards every member of the Association.

Dr. BEATTY, in seconding the motion, said that when it was made known in Ireland that this great Association had been pleased to select this part of her Majesty's dominions for meet-

ing in 1867, he confessed he felt the greatest pleasure when he found it was to be presided over by his friend Dr. Stokes. He felt that Irishmen were put on their trial, but he also felt that their honour and reputation were safe in the hands of Dr. Stokes—he felt all doubt disappear when he heard he was to be the President of that great Association, and he was quite pleased to find that his merits were appreciated by the Association.

The CHAIRMAN, in putting the motion, said it was Dr. Stokes's happy privilege to be the founder of a new era in the history of the Association.

The resolution was carried with acclamation.

Dr. STOKES, in reply, said—I feel very much moved by your kindness. I have done my best. I am quite sure I might have done better. I feel with Dr. Beatty great regret at parting with you, hoping, however, we may meet again before long. All I can say is, that from the bottom of my heart I thank you.

This concluded the business of the Association.

THE CONVERSAZIONE AT THE ROYAL COLLEGE OF SURGEONS.

In the evening the members of the Association were entertained at a grand conversazione, by the President and Council of the Royal College of Surgeons. The arrangements were perfect, and gave universal satisfaction. The attendance was scarcely so large as at the two previous soirees, many members having left Dublin during the early part of the day.

Messrs. Weiss & Sons' instruments were much admired, especially those for the operation of lithotomy; as were also those exhibited by Dr. L'Estrange.

The museum, library, examination hall, and all the other apartments of the College were thrown open for company. A highly interesting collection of instruments and objects of scientific and philosophical interest were exhibited. Amongst these were many rare specimens illustrative of natural history. Much admiration was excited by some beautiful casts of fish, painted from recent specimens under the direction of Dr. Carte, and by a process invented by him, representing fish in their natural colours, and with the fresh and glistening appearance which they present on being taken out of the water. Dr. Barker, the Curator of the Museum of the College; Dr. Mapother and Dr. Richardson, exhibited some most interesting microscopic preparations.

Altogether it was one of the most successful and best arranged meetings of the week, a worthy finale to a noble and magnificent reception.

SATURDAY, AUGUST 10.

About fifty-six members enjoyed the Boyne excursion under the leadership of Sir William Wide; and a large number went on the Wicklow excursion under the conduct of Dr. Darby.

SOIREE, NINE P.M.

Lord Talbot de Malahide, President of the Royal Irish Academy, gave a conversazione to the Members, at the Academy Buildings in Dawson-street. It was numerously attended by ladies and gentlemen, who, with much interest, examined and admired the antiquities and objects of art belonging to this distinguished body.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

THE President, Vice-President, Council, and Fellows met on Thursday last, at three o'clock, for the purpose of conferring on Mr. Syme and Mr. Bowman, F.R.S., the Honorary Fellowship of the College.

The President having entered the Board-room, and taken his seat, Mr. Syme and Mr. Bowman were presented to him.

The PRESIDENT (Dr. Robert Adams) then said—

Mr. Professor Syme and Mr. Bowman—You have been made aware of the circumstance that on the 1st of August you both have been unanimously elected Honorary Fellows of the College, by a resolution of Council. We now avail ourselves of your presence in our city to put into your hands our diploma. We feel that in this place it would be quite unnecessary to state our reasons for so acting, or to add what you have done for the advancement of the science and art of Surgery. Both of your names are interwoven with the progress of surgery, and the shelves of the library of our College have long contained your several works. By handing to you these diplomas, and adding your names to the scanty, or rather *recherché* list of honorary fellows, we give the best proof of the estimation in which you are both held in this College. By so acting we express a wish to do you an honour, and cannot doubt but, at the same time, the College itself will be really honoured by having added to its list of honorary fellows the names of two such men as those of Professor Syme and Mr. Bowman, in the eminent position ye have both attained, the one in Edinburgh, that revered seat of medical learning and of scientific education, and the other in London, the capital of the world. Lastly, I congratulate myself upon the circumstance of my being President of this College, and that I have been thus the medium of communicating to two of my valued friends the greatest distinction the Royal College of Surgeons in Ireland has to bestow.

The Diploma of Fellowship, enclosed in handsome morrocco case, was handed to Mr. Syme and Mr. Bowman, amid loud applause.

Mr. SYME then said—Mr. President and Gentlemen,—Many years ago, when little more than a student, I happened to be present when the foundation stone of this magnificent building was laid by the Marquis of Wellesley, and then very little anticipated that within its walls I should now receive such a distinguished honour as that which you have been pleased to confer upon me. I fully appreciate its value, and beg you will accept the assurance of my deepest and sincerest gratitude.

Mr. BOWMAN said—How can I express my grateful feelings on receiving so unexpected an honour from this great College, representing Irish Surgery, and in the presence of so many distinguished men? I am reminded by the place in which I stand, and by your honoured presence, sir, in that chair, of days long since passed, when you, and others of your colleages in the great clinical school of Dublin, inspired a young student with sentiments of admiration which the lapse of time has only served to strengthen; and when you admitted me to your friendship, what I then saw of the system of teaching pursued in the wards of the great hospitals of your city, and the careful study I made of the stores accumulated in your museums (and I referred to my notes of them but yesterday), convinced me that the Dublin School of Medicine and Surgery—eminently honest, scientific, and practical—was second to none in Europe, if, indeed, it did not in some respects surpass most. I found Collis, Cusack, yourself, sir, Carmichael, Porter; with Graves and Stokes in Medicine, laboriously and richly turning to the best uses of science and of instruction the great opportunities you possessed—exhibiting yourselves to your students as students yourselves in the great field of nature, and imbuing them thus with your noble spirit as well as with your doctrines. The eminent merit of Dublin as a Clinical School of Medicine and Surgery has been, perhaps, less appreciated than it deserves by the world at large, owing to its geographical position, somewhat aloof and insulated from the ordinary tracts of travel. The more it is known by personal inspection, the more highly, I am certain, will it be esteemed; and I am conscious that no reward which so humble an individual as myself can possibly receive for professional labours, could be more flattering than spontaneous and honourable testimony of the good opinion of such a corporation as yours. I may be permitted to say that its value is enhanced by the circumstance that, in receiving it, I stand by the side of one of the most distinguished men that any age of great Surgeons has produced. I hope I shall not be considered out of order if I add my grateful acknowledgments, as an individual member of the British Medical Association, for the grand hospitality with which it has been received by the profession in Ireland. How auspicious, in all respects, the present meeting appears, and how calculated to promote that unity of sentiment, of thought, and action, so necessary to be fostered through the whole body of our profession in the present day. Our Association is growing more and more into harmony with the spirit of the age in which we live; may all its wise purposes be accomplished. May it be a bond—it, or something like it, must apparently be the main bond of the future—between all our members, if all are to be brought truly into one community and fellowship. For local colleges and corporations which have a local origin and seat, must ever remain more or less local and restricted—must have local duties, local interests, local sympathies. That only can bear an universal character which is migratory, finding its home everywhere in turn; which is willing to embrace and include every honest earnest member of our profession, wherever his lot may chance to lie, wherever his field of honourable toil, whatever the style or title by which he may be addressed. Gentlemen, I thank you. (Applause.)

The College then adjourned.

ANDERSON'S UNIVERSITY, GLASGOW.

THE MEDICAL SESSION will be opened on Tuesday, the 29th of October, 1867

Chemistry	10 A.M. ...	Dr. Penny.
Practical Chemistry ...	11 A.M. ...	
Surgery	11 A.M. ...	Dr. G. H. B. Macleod.
Institutes of Medicine ...	12 noon ...	Dr. E. Watson.
Anatomy Lectures ...	5 P.M. ...	Dr. George Buchanan.
Demonstrations on Practical do.	1 P.M. ...	
Materia Medica	3 P.M. ...	Dr. Morton.
Practice of Medicine ...	4 P.M. ...	Dr. J. McCall Anderson.
Midwifery (in Summer) ...	... ...	Dr. J. G. Wilson.
Medical Jurisprudence (in Summer)	... ...	Dr. Leishman.
Botany (in Summer) ...	... ...	Mr. Hennedy,

CLASS FEES.—For each Course, £2 2s.; Second Session, £1 1s.; afterwards free. Anatomy (both Courses), £4 4s.; Second Session, £4 4s.; afterwards free. The fees for *all* the Lectures and Hospital Practice required for a Diploma amount to £40.

A Syllabus, with full particulars, may be obtained from Dr. George Buchanan, 193, Bath-street, Glasgow.

ST. BARTHOLOMEW'S HOSPITAL MEDICAL COLLEGE.

WINTER SESSION, 1867.

THE INTRODUCTORY LECTURE will be given by Dr. ODLING, F.R.S., on TUESDAY, OCTOBER 1st, at Five P.M.

COLLEGIATE ESTABLISHMENT.

Students can reside within the Hospital Walls, subject to the College Regulations.

Further information may be obtained from Mr. THOMAS SMITH and Mr. CALLENDER, and at the Museum or Library.

LONDON NURSES' INSTITUTE, 42, South Audley-street, Grosvenor-square, W.

TRAINED NURSES (Medical, Surgical, Mental, and Monthly), can at all times be obtained from this Institute.

Hospital Appointments by special arrangement.

Letters and Telegrams should convey the nature of the case to be attended.

Apply to the Manager or Matron. T. HAMILTON, Manager.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

NOTICE is Hereby Given, that the next QUARTERLY EXAMINATION for the DIPLOMAS in MEDICINE and MIDWIFERY will be held in the COLLEGE HALL, on TUESDAY 27th, and WEDNESDAY 28th AUGUST, prox.

Candidates qualified as follows are required to undergo the second day's Examination only, viz.:—

1. Graduates in Medicine of a University recognised by the College.

2. Fellows, Members, or Licentiates of the Royal Colleges of Physicians of London or Edinburgh, who have been admitted upon Examination.

3. Members or Licentiates of the Royal Colleges of Surgeons of London, Edinburgh, or Dublin.

Candidates for Examination shall return their Names to the Registrar of the College, and lodge their Fees and Certificates, on or before the 24th day of August, prox.

LOMBE ATTHILL, M.D., Fellow and Registrar.

July 31, 1867.

Apothecaries' Hall of Ireland, 40 Mary-street. The following new Medicines and Preparations are manufactured in the Laboratory on the premises, and a supply constantly on hand:—

THE NEW PREPARATIONS OF THE PHARMACOPŒIA, 1867.

TICHBORNE'S VESICATING COLLODION.

Dr. Richardson's Styptic Colloid; Syrup of Phosphate of Iron, Quina, and Strychnia; Chlorate of Quina; Perchloric Acid; Carbolic Acid, pure and crude (the latter free from Sulphuretted Hydrogen).

WOODHALL Spa and Hotel, near Horncastle, Lincolnshire.—This well-known Mineral Spa, which has been for many years highly recommended by the Faculty for the cure of Strumous Complaints, Tumours of various kinds, Rheumatism, Gout, Epilepsy, and Specific Constitutional Diseases, especially those of the Skin, is now in first-rate order. The Hotel replete with every comfort, and the charges moderate. Hot, cold, shower, and hip-baths always ready. This Spa contains more Bromine and Iodine than any known water; and its curative powers are unsurpassed.

The Woodhall Spa Station of the Great Northern Railway closely adjoins the beautiful grounds of the Hotel. The water will be supplied bottled, or in jars, on application to the Bath-man.

June 1, 1867.

APOTHECARY WANTED.

SKIBBEREEN DISPENSARY.—Salary, £20.

SALE BY TENDER.

TO MEDICAL MEN AND THE CHARITABLE.

THE COMMITTEE of the LONDON SURGICAL HOME HOSPITAL for WOMEN, Notting-hill, have determined to receive Tenders for the purchase of the Ground Leases of Nos. 17 and 18, Stanley-terrace, the Lease of No. 35, Ladbroke-gardens, together with the whole of the Furniture and Fixtures contained in the houses now in the occupation of the Home. The Committee are desirous, if possible, of perpetuating an institution where so much good has been done, and which is likely to receive the support of, and yet to prove a great boon to the neighbourhood. The Committee do not bind themselves to accept the highest of any tender, but avow that a preference will be given to Medical Men and the Charitable. Particulars of the Leases, and detailed lists of the Furniture, &c., may be seeen at the Home, and premises viewed, by application to—

WOLLASTON F. PYM, Secretary.

By Order of the Committee.

Stanley-terrace, Notting-hill, August 7th, 1867.

Tenders to be delivered at the Home on or before the 19th instant.

ACCIDENTS WILL HAPPEN!!

EVERYONE should therefore provide against them! £1,000 IN CASE OF DEATH, or £6 Per Week while Laid up by Injury, caused by ACCIDENT OF ANY KIND (Riding, Driving, Hunting, Shooting, Fishing, &c.), May be secured by an Annual Payment Of from £3 to £6, 5s. to the RAILWAY PASSENGERS ASSURANCE COMPANY, CORNHILL, AND 10, REGENT-STREET, LONDON.

WILLIAM J. VIAN, Secretary.

LECTURES ON

Experimental and Practical Medicine. By BENJAMIN W. RICHARDSON, M.A., M.D., F.R.C.P.

Dr. Richardson delivers a lecture on Experimental and Practical Medicine on the first Tuesday of every month (except during the months of July, August, and September), at the Laboratory, 12, Hinde-street, Manchester-square, W. The lecture hour is from 4.30 to 5.30 P.M.

The Lectures treat on such new subjects in the advance of medicine as admit of demonstration and of useful application in daily practice; but they in no way interfere with the systematic teachings of the Medical Schools, and Students of any school may enter for the Course.

Fee for the annual Course of Nine Lectures, with certificate of attendance if wished, £5 5s.

The Course will recommence on the 4th of October.

Applications for admission are to be made to Mr. John Skinner, 12, Hinde-street, W.

HEDGES AND BUTLER

SOLICIT ATTENTION TO THEIR

PURE MONTILLA SHERRY,

Free from Spirit; strongly recommended for Invalids. This wine is extremely delicate, and to those requiring tone to the system, but who cannot drink the ordinary strong wines of Spain, will be found invaluable.

PURE ST. JULIEN CLARET,

At 18s., 20s., 24s, 30s., and 36s. per dozen.

Choice Clarets, of various growths, 42s., 48s., 60s., 72s., 84s., 96s.
Good Dinner Sherry, 24s., 30s., and 36s.
Choice Sherries, 42s., 48s., 54s., 60s.
Port, from first-class Shippers, 30s., 36s., 42s.
Very choice Old Port, 48s., 60s., 72s., 84s.

List of all other Wines and Liqueurs on application.

HEDGES AND BUTLER,

London, 155, Regent-street, W., and 30, King's-road, Brighton.
Originally Established A.D. 1667.

Langdale's Ethyl C4 H5 and Cantharidine will positively reproduce, thicken, and prevent the HAIR falling off, also rapidly promote the growth of Whiskers, Moustaches, &c, Dr. C. J. B. Williams, F.R.S.: "I use and recommend your Cantharidine for restoring the hair." D. W. Roberts, M.D.: "The best stimulant for the hair that can possibly be invented." Sir W. J. Hooker, F.R.S., Royal Gardens, Kew: "Scientific, ingenious, and useful to mankind." Viscount Arbuthnot, Fordown, N.B.: "Gives me very great satisfaction." The late Earl of Limerick: "A most valuable chemical compound." J. G. Stoddart, chemist. 5, Grass Market, Edinburgh: "I never saw anything bring out the young hairs on the face so rapidly." The late Earl of Eglinton: "I am well convinced of its efficacy." J. C. G. Tice, Esq., M.D., C.B.: "I find it the best preparation for the hair I ever used." Mrs. Park Pittar, 16, Kensington-park-gardens: "At once stopped her hair from falling off." Post free, 3s. 6d. and 5s.—Laboratory, 72, Hatton-garden, London.

ABSTRACT OF A PAPER ON "STATE MEDICINE,"

By J. W. RUMSEY, F.R.C.S.

(Read before the Thirty-fifth Annual Meeting of the British Medical Association, held in Dublin, August 8, 1867.)

Mr. Rumsey said—Not many years ago, state medicine in England was treated, even by well-informed persons as a mere idea—a speculative theory—or, at best, a German innovation. Its objects were not understood; even the very meaning of the word was dark. His present purpose was to call attention to some of the more remarkable effects and anomalies of our public arrangements, and then to show how the primary objects of preventive and legal medicine might be attained. The first point to which he would refer, and which he believed to be at the very root of the matter, was our public system of inquiry into and the causes of mortality. The two great branches of state medicine sprung from the same root—scientific inquiry. If the results ascended through a well-organised stem of record, they would expand into a noble tree of knowledge, the fruits of which might be safely used to amend the administration of justice, to improve the social condition, and to prolong the lives of the people. After reviewing the growth of vital and medical statistics during the last forty years, he proceeded to say that the simple fact of death was not accepted by the Court of Chancery or the Bank of England as legal proof of any reported death, while as to the so-called "cause," the greatest possible discrepancy existed as to the matters reported, the persons who reported, the nature of the report, and the subsequent use made of it. In a multitude of cases neither the cause nor even the manner of death was returned. As to medical duties and liabilities, there was an almost entire absence of necessary safeguards in signing a medical certificate; and there was reason to believe that the cause of death had sometimes been certified by a too confiding practitioner when the patient was still alive. In his opinion it was the duty of all members of the profession to refuse to certify any facts which they had not ascertained on clear undisputable evidence. He would now pass on to the second branch of his subject—the medico-legal—that touching coroners' inquests, and that which might be more strictly called forensic medicine. While he had no desire to undervalue those legal verdicts in cases of sudden, doubtful, or violent deaths, he thought investigations of the kind were far more perfect and trustworthy under the Scottish system, in which an official inquiry, initiated by the Procurator-Fiscal, took the place of our coroners' inquest. The recent alteration in the law tended to diminish the number of necessary inquiries; and Dr. Taylor was of opinion that the system afforded no certainty for the detection of crime, no protection to those who were wrongly accused, and that, in some cases, it screened a criminal by a verdict based on an imperfect inquiry, in which the important medical facts were misunderstood or misinterpreted by the jury. The additional expense for a post-mortem examination led to the refusal of the order for such inspection. Cases were recorded in which deaths by poison or violence were thus concealed, the facts coming to light some years afterwards. They might conclude with Dr. Taylor that every inquest in which there had been no medical inspection of the body was a vain mockery. If an inspection was not required, an inquest was unnecessary. Many persons who held the office of coroner had neither medical nor judicial qualifications for the proper discharge of its duties; no preliminary test of ability or special qualification being required. These abuses could not remain unremedied by Parliament without degradation of this ancient office. No provision was made for the employment of skilled witnesses or assessors, the usual practice in England being to select the nearest medical practitioner, and it was not uncommon for the coroner to summon his personal medical friend, whether he had forensic experience or not. He next referred to the anomalous position occupied by the members of their profession, when subpœnaed to give evidence in courts of justice, where, unfortunately, from the circumstances in which they were placed they became partisans, and while they desired to state the truth they did not do so in one point of view, their testimony being such as to serve the cause of their patients. In the next place, the lecturer alluded to the sanatory department of public medicine, adding that comparatively few officers of health who were appointed for this purpose to English towns and parishes beyond the metropolitan boundaries, rarely, if ever, found any correspondence between the limits of their districts and the territorial divisions of the country, in which the great facts of population, mortality, and reproduction were collected and returned under the Census and Registration Acts. This was not the case in Ireland, where the organisation for medical relief was made the basis of areas for sanitary administration, and these again identified with registration districts. There was an utter absence of any check against the appointment of imperfectly qualified persons as officers of health, nor was any special qualification prescribed for this officer, and there was a total absence of any general regulations for defining the duties, terms, conditions, and relations of the medico-sanitary appointment. Adverting to the remuneration of those officials, he observed that Dr. Mapother received for his arduous and valuable labours the munificent remuneration of four-sevenths of a farthing per head on the population of his district; yet, if his advice were utilised, as it deserved, not less than ten years would be added to the average duration of life of every inhabitant of this metropolis. In his opinion the amount of salary in each case should be subject to general regulations, or to the approval of a certain authority. In conclusion, he drew attention to the result of the late attempt to report on the question at Birmingham, where a number of resolutions were passed, and urged the adoption of some decisive measure in support of the proposition then brought forward by Dr. Farr.

ON IDIOPATHIC ABSCESS OF THE BRAIN.

By LORY MARSH, M.D.

(Read before the Thirty-fifth Annual Meeting of the British Medical Association, held in Dublin, August 9, 1867.)

Instances of abscess occurring within the substance of the brain are sufficiently rare, under any circumstances, to claim our careful consideration. Cases in which the abscess has resulted from constitutional causes, altogether apart from external injury, are still more rare; and the case which I shall have the honour to bring before the Association presents many points of special interest.

The patient was a gentleman, thirty-five years of age, engaged in extensive practice as a solicitor, very regular and temperate in his habits, whose family were remarkable for longevity, and amongst whom there was no trace of any hereditary predisposition to strumous or other constitutional disease. Two years after his death his mother became the subject of cancer, of which I counted 150 tumours on her body at one time, varying in size from an egg to a small pea. She died from the effects of internal cancer, at the age of seventy-two.

Nothing further occurs in the family history of this particular case about which it will be necessary to occupy the time of the meeting. The personal history of the patient claims a little closer attention. He was, from boyhood upwards, a hard-working, plodding fellow, who, at the age of twenty-seven, had by his own exertions placed himself at the head of a very large practice as a lawyer. In his progress nothing particular was observed pointing to any injurious effect on his mental or physical condition. He had done above an average amount of honest hard work, had lived temperately, and was remarked upon as a man who had engaged in the battle of life more vigorously and

with less injury to himself than the generality of his fellows. In June, 1863, a circumstance occurred which for the first time caused him to consult me respecting his health; the only occasion on which he had previously required medical attendance during his recollection was several years ago for an attack of ophthalmia. When he consulted me he stated that a few weeks previously he had taken his brother-in-law to London for the benefit of his health, and, whilst away at an hotel, his relative was suddenly seized with symptoms of insanity, and in the middle of the night he burst into my patient's room in a condition of raving madness. Assistance was obtained as soon as possible, and he was removed to an asylum, where he died in the course of a few days. My patient sustained no physical injury of any kind from his brother-in-law except the severe shock which such a frightful circumstance was calculated to produce. If he evinced one mental qualification stronger than another it was a remarkable self-possession, the exercise of which enabled him to control his own feelings whilst he kept a check upon the maniacal frenzy of his relative.

It was after the funeral of his brother-in-law, and on his return home, that he requested me to visit him. He complained of feeling completely "unstrung;" had no relish for his business, in fact, felt an incapacity to engage in it; whereas, formerly, the more intricate and complicated the business, the more pleasure he had in grappling with it; whilst now, the thought of a difficulty frightened him, and he became nervous and excited at every little disturbing cause. His temper, usually wonderfully under command, was noticed to have become irritable. His sleep was broken, and he was often obliged to get up in the night and walk about his bed-room, to relieve the restlessness in his legs, which he described as "bone fidgets." He made no complaint of pain either in his head or any other part of the body. No alteration was observed in his general health, except that his appetite was not quite so good, and he complained a little of occasional nausea. In appearance he was greatly changed; he was pale, his eye to some extent had lost its lustre, and he had an anxious and careworn expression, at the sametime, he expressed a conviction that he had never been the same man since the occurrence of his brother-in-law's insanity.

Looking upon his condition as due to severe mental shock and subsequent exhaustion, I prescribed a tonic and restorative treatment, and ordered him away from home for change and rest. Acting upon my advice, he went with his family to the sea-side, from which he appeared to derive some slight temporary benefit. On his return, I continued occasional attendance upon him. He complained more or less of a continuance of the same symptoms; and, fearing he was becoming somewhat hypochondriacal, we endeavoured to rally him as much as possible, and tried to induce him to take a hopeful view of his case. The effect of the treatment and general management was so far successful that he was able to apply himself to the duties of his profession, until March, 1864, on the 24th of which month, whilst settling some law business, he was suddenly attacked with the following symptoms:—Slight numbness down the right arm, and a sensation as though a piece of leather was interposed between the fingers, slight faintness, and an inability to articulate distinctly. A glass of wine was given him, and in a few minutes he recovered sufficiently to complete the business upon which he was engaged. The next day, whilst engaged at his office, he had two more attacks, the same as the one above described, and, on the second day, whilst similarly engaged, he had a much more decided one. He was, as before, slightly faint; complained of numbness down the right arm, with the leathery feeling between the fingers, and was also unable to articulate or write distinctly. For instance, he wanted some water, and failing to be able to pronounce the word, he tried to express his wants in writing, and was unable to spell the word water correctly, or even his own name. About ten or fifteen minutes after the commencement of the attack, he was apparently quite well, and I accompanied him home to his house, a distance of about a mile. He did not again return to his office, but employed himself about his garden, and drove out every day, seeming thoroughly to enjoy the relief from business. His health appeared to improve, and his spirits became much more buoyant. It was arranged he should go on the Continent for six months, to try the effect of a long period of rest, combined with entire change.

On the 15th of April, whilst arrangements were being made for his leaving England, he had another attack, which occurred under the following circumstances. He was talking to his gardener respecting the removal of the trunk of a tree, and having got half through his instructions, he was unable to complete the sentence. Mortified and annoyed at what he described as so much like the act of a fool, he returned to the house, (a distance of about 100 yards), by which time the attack had entirely passed away, and he could talk as fluently as ever. I saw him shortly afterwards, and noticed, for the first time, that the upper lip on the right side drooped a little, and that the saliva collected slightly in that angle of the mouth. It is worthy of remark, that up to about twenty years of age, he was such a fearful stammerer, that it was almost impossible to hold any conversation with him. This defect, however, he had entirely overcome, and had not, for many years, shown the least disposition to a return of it. At first it was suggested that the difficulty he experienced in articulating during the attacks to which he had recently become subject, might depend upon a temporary arrested nervous power, similar to that which caused him to stammer, especially as he had no impediment in his speech, except when the attacks were upon him. Although he only had four attacks during the same number of weeks, and these of so slight a character, the symptoms nevertheless acquired importance from the fact of their progressive character.

On the 23rd of April, just one month after the first attack, he was seized whilst in bed, with the most fearful pain on the left side of the head I ever witnessed. The pain was somewhat paroxysmal in its character, though never entirely absent. It was accompanied with rigors, vomiting, and the ordinary symptoms of irritative fever. The right arm lay comparatively motionless by his side, and ultimately the paralysis extended to the right half of the body. The pupils, especially the left, were dilated and fixed. The urine was passed at longer intervals, but was never found to be saccharine in character. His symptoms gradually deepened in intensity, and he died in a state of profound coma, on the 30th of April, thirty-four days from the commencement of the attacks. The case was attended with me, during a portion of its progress, by Dr. Ransom, and Mr. Joseph Thompson, and two days before his death Dr. Gull joined us in consultation.

A post-mortem was made thirty hours after death, in the presence of Dr. Ransom and Mr. Joseph Thompson, and the following notes were taken at the time:—Weather mild; body commencing to be decomposed; very slight vascularity of the scalp; calvarium healthy; dura mater externally healthy; on being removed, and the pia mater exposed, the surface of the brain was observed to be drier than usual, and the convolutions a little flatter and paler on the left side than on the right. Pia mater more vascular on the right than on the left side; very slight sub-arachnoid effusion on the left side, which was softer than the right, having an obscure feeling of fluctuation. On removing the upper portion of right cerebrum, the grey and white matter was found normal as regards colour and consistency. A horizontal section on the left side, three-quarters of an inch thick, exposed a slight prominence in the substance of the brain, near the surface, about the junction of the posterior and middle lobes, having a layer of yellowish softening around it, a part of which was removed by the section. On cutting a little deeper there exuded a dirty yellowish-green puriform fluid (not fœtid), which was evidently contained in a cavity having well-defined vascular walls. On making a deeper section there flowed out a good deal of clear fluid from the right lateral ventricle, about three or four drachms

in quantity. The plexus choroides and inner surface of the right ventricle were natural in appearance. The internal convolutions extend over towards the right side in a bulging manner. On opening the left lateral ventricle, its contents were less in quantity than on the right side, but similar in character. The corpus striatum and thalamus were pushed rather more towards the centre. External to these ganglia there is a trembling of structure, probably indicative of some fluid or softening. No further disease on the right side. On removing the brain and examining its base, the vessels and membranes seem healthy. An average quantity of bloody serum remained in the occipital region after the removal of the cerebrum, cerebellum, &c. The cerebellum, pons varolii, and medulla oblongata healthy. There is absolutely no trace of scrofulous or other deposit at the base of the brain, on the membranes, or elsewhere. A transverse vertical section was made across the abscess and junction of the corpus striatum and thalamus, when it was found that there were two or more irregular sinuous abscesses near each other, surrounded for a considerable distance by pale yellowish softening; the softening approached very near the surface of the convolutions. All the abscesses put together were about the size of a walnut. The substance of the corpus striatum and thalamus was not involved in the abscess, although the softening, the limits of which were not well defined, probably was. The total area occupied by the softening was about the size of a hen's egg.

Careful examination of the bones and membranes covering the base showed no trace of disease. The dura mater was stripped from the temporal bones, which were found to be healthy. Sections through the pons and medulla showed no disease. The lungs were full of air and did not collapse, everywhere crepitant, soft, and elastic, not a trace of consolidation or deposit anywhere; some effusion, about half a pint. The heart was soft and flabby, the valves were healthy, the muscular walls of an average thickness, and the cavities of normal dimensions. The liver healthy. No enlarged mesenteric glands discoverable, or any along the spine. The kidneys, and rest of the viscera, perfectly healthy. Nothing further was observed upon the most careful examination.

The portion of the brain in which the abscess was situated was sent to Dr. Gull for examination, who concurred in the opinion as to the nature of the case.

All pathologists agree in the extreme rarity of abscess within the brain, apart from physical injury, and not the result of secondary deposit. Dr. Gull, in an elaborate paper upon "Abscesses of the Brain," in the third volume of the third series of the Guy's Hospital Reports, says—"a recent writer admits the occurrence of idiopathic cerebral abscess;" in reference to this opinion Dr. Gull remarks, "I suppose he (alluding to Lebert in his Archives of Pathological Anatomy) means no more than abscess whose origin is unaccounted for, since we have no evidence of any such intrinsic perversion of the nutrition of the brain as leads to suppuration. The nearest approach to such a result is in scrofulosis, but then only where the scrofulous deposit acts as an extraneous substance upon the tissue in the same manner as an hydatid cyst; in neither of which cases can the suppuration be considered idiopathic." In another part of the same paper Dr. Gull adds, "If it be true, as I believe it is, that with the exception of suppuration produced by scrofulous deposit, idiopathic abscess of the brain does not occur, and that with the exception of that which follows direct injury, it is a secondary result of the suppurative process in some distant part, or of chronic disease about the head, then it is obvious that a scrutiny of every organ is the first step in the diagnosis, or that, at least, without which the diagnosis cannot be completed."

Undoubtedly secondary abscess of the brain, when met with, is frequently associated with disease of the ear or nose, or with scrofulous deposit in some part of the body, in which latter case, by a species of metastasis as it were, suppuration is observed to take place in the cerebral substance.

Dr. Gull mentions a case, as having occurred in the practice of Mr. Bottomley, of Craydon, in which an abscess the size of a small orange was found in the posterior part of the middle lobe of the cerebrum on the right side. This case cannot be admitted as one of idiopathic abscess, because the patient was subject to nasal polipus with a mucous discharge from the nostrils, and unfortunately no examination of the interior of the nose or of the viscera of the thorax or abdomen was made at the time of the post-mortem, consequently it is but right to infer that this was a case of secondary abscess.

Keeping these facts carefully in mind, and fully recognising their important bearing on the present case, our search during the post-mortem was of the closest and most careful character, still not a trace of anything pointing to a primary cause of the abscess could be discovered. I am bound, therefore, though opposed to so careful and close a reasoner as Dr. Gull, to regard the case I have described as one of idiopathic abscess, dependent upon perverted nutrition, originating in the mental shock sustained by the outbreak of his brother-in-laws insanity.

At the consultation, which took place upon my patient, two days before his death, I expressed the opinion that he was suffering from an abscess somewhere in the left hemisphere of the brain. I was led to arrive at this opinion, unsupported as it appeared to be by facts, and, indeed, opposed to experience, from a consideration of the following circumstances. The paralysis is of the right arm, to a great extent indicated the locality of the disease, which might have depended upon a diseased condition of the blood-vessels *per se*, resulting in subsequent rupture, or might have been due to the presence of a tumour making its way towards the surface.

The early history of the symptoms could not be explained satisfactory upon the supposition of disease in the blood-vessels, neither could the suddenness and violence of the pain, the severe rigors and irritative fever that followed, be accounted for to my mind by the presence of a tumour with surrounding softening. The only remaining conclusion was, that acute suppuration was the cause of the mischief.

I have purposely avoided occupying the time of the Association with any account of the treatment adopted in the case under consideration, for a Lebert says, "There is no recorded case of cerebral abscess undergoing the process of cure." It becomes, therefore, a matter of but slight importance what form of treatment is adopted in a case so hopelessly certain in its results, so long as that treatment is in accordance with the recognised principles of our art. Exploration of the substance of the brain, even though a tolerably accurate diagnosis could be arrived at, would not offer a sufficient chance of success to counteract the uncertainty which must at all times surround a case enshrouded in such great obscurity. Even could we succeed in striking the abscess, its progress would necessarily add to the fatal character of the disease. All cerebral abscesses take the direction through the organ where the least resistance is opposed to their progress, and thus establish a labyrinthal maze into which the recourses of our art can find no entrance.

TREATMENT OF DISEASED JOINTS BY ESCHAROTICS.

By FREDERICK KIRKPATRICK, M.B., F.R.C.S.I.

(Read before the Thirty-fifth Annual Meeting of the British Medical Association, held in Dublin, August 9, 1867.)

I AM permitted the honour of addressing you, sir, and the Members of the British Medical Association, upon the subject of diseases of the bones and joints, principally with regard to a new mode of treatment by incision, and the deep introduction of caustic, (the potassa c calce,) into the cancellated structure of the articulating extremity of the bone in the incipient stage, or that of inflammatory congestion, and into the joint itself in the very advanced

periods. I believe that the present era of the Profession is peculiarly apt for the consideration of this subject, inasmuch as the literature of this portion of surgery is daily becoming more and more unsettled and contradictory, some surgeons of highest authority advocating early operative interference, whilst yet the constitution is unimpaired by the exhausting progress of disease; other distinguished men putting their faith in rest, with proper mechanical adjustment, and advising that patient trust should be placed in the healing operations of nature.

Between those contrasted extremes every variety of opinion and practice may be found to prevail, as boldness excites to action, or caution inclines to delay.

The statistics of conservative surgery, more particularly of the great revived operation of excision of the knee-joint, are the reverse of satisfactory; the high expectations formed from the successful cases have not been fulfilled by a sufficient percentage of cures, and in many instances the reported cures have not been permanent.

In the last work on joint diseases, published this year by Mr. Holmes Coote, of Bartholomew's Hospital, the following conclusions are arrived at, based on the statistics of Dr. Hodges, of Boston:—"Considering the mortality after the operation, excision for hip disease does not merit a very favourable verdict. Excision at the knee, although occasionally yielding brilliant results, is an operation to be practised with great reserve. Excisions at the wrist-joint being followed by a large proportion of failures, and when successful, the usefulness of the hand being so limited, are operations not sanctioned by sound judgment or conservative surgery. Operations on the foot for strumous disease, usually yield unsatisfactory results."

Dr. Hodges, of Boston, in his "Essay on the Excision of Joints," observes:—"Out of a considerable number of cases, one-third died, and more than one-third are known to have failed." I repeat then that a period has arrived when doubt and uncertainty pervade this most important department of surgery, and it has become a question as to whether there was not a greater saving of human life, when early amputation was the rule, than in the interval that has since passed over. It is also especially worthy of remark, that excision has rarely, if ever, been performed in private practice.

At the commencement of his magnificent address at Chester, Mr. Bowman, that great benefactor of his race, called surgery "the hands of God, the human hands." I may be permitted to add, hands never to be put forth to the execution of any operation, but when their possessor can say he would himself consent to its performance were he the patient. I believe that the rigid application of this golden rule in surgical ethics, would very much limit the future performance of operations for excisions, save only at the elbow-joint.

In the surgical charge of the North Dublin Union, the largest chronic hospital with one exception in this country, I have had, during the last twenty-five years, ample opportunity of judging of the effects of rest in the treatment of those affections, and the result of my experience has been most unfavourable.

A certain amount of success may be looked for in the treatment of the upper classes, where the purest air, the best nourishment, the most approved mechanical appliances, together with the means of easy locomotion, can be commanded; but, with the lower classes, I have found that the treatment by rest has been a history of failure; disease spreading from bone to bone in the smaller articulations, and before the consolidation of a large joint could be completed, organic disease having, in general, invaded the liver, or some of the other internal organs.

This unsuccessfulness forced me some years ago into the discovery of this treatment by cauterization which, I propose. Having often remarked the healthy reparative action that followed the use of the potassa c. calce in sinuses in the groin, neck, and axilla, I began to introduce it into fistula leading down to diseased bone, at first with caution, then more boldly, and finally disregarding Sir B. Brodie's strong injunctions against letting potassa fusa enter a sinus, I proceeded to carry its action deeply down, converting the small contracted painful orifices into large funnel-shaped openings, and bringing the carious bone into view, and within reach of the further application of the caustic. In this manner, several cases of disease of the carpus and tarsus, and of the flat and superficial bones, were successfully treated, the caustic being reapplied at intervals of a few days, to keep the orifices freely open until the carious bone had disappeared, or was covered over with firm granulations.

In a similar manner, several cases of chronic necrosis were treated, the caustic being very freely used, destroying all foul undermined integument, and leaving, after the removal of the sloughs, large clean circular openings, more than an inch in diameter, and extending deeply down to the sequestrum, into contact with which the caustic, in stick and powder, was freely brought.

In this manner, two cases of necrosis of the fibula, very similar to each other, in which numerous openings led down to diseased bone, and where the patients were reduced to the lowest state by years of suffering, were perfectly cured within six months.

In a case of necrosis of the heel in a delicate lad, who was deformed by the effects of an old hip disease, a caustic perforation was made at each side of the heel, and the powder was brought into contact with the dead bone, until it was so removed that a catheter was passed quite through the heel, no inflammation or constitutional disturbance having been caused or excited.

I can speak with the utmost confidence of the application of this remedy in all such cases of caries affecting the superficial bones.

The caustic perforations may be multiplied in proportion to the extent of the disease, respect being paid to important nerves and vessels, and care being taken not to destroy sound structure, or periosteum beyond the limits of the diseased surface of the bone. Before I speak of the application of this remedy to the arrest of the early stage of joint disease, I may be permitted to allude to the important question as to the structure which is first attacked.

My own opinion accords with those authors who believe that in the great majority of cases the disease commences in the cancellous structure of the heads of the articulating bones. That there are rare cases where it begins in synovial membrane or cartilage, and mixed ones which, seen at a late period, may perplex diagnosis, I fully believe; but I consider that those instances where the fons et origo maliarises in the bone, preponderate so enormously that, as a rule of practice, it cannot be too strongly insisted upon. My own opportunities of obtaining pathological evidence have left me without a doubt on the subject, and the practice which I propose is based upon that conclusion.

In Sir B. Brodie's great work on the joints, he recognises the fact of the frequent origin of disease in the cancellous structure, and he describes the heads of the bones as distended, with a reddish medullary fluid, then softening of the tissue, and finally suppuration—the matter either forcing through to the cavity of the joint, or reaching the surface at some position more or less remote; but whilst he thus clearly recognises the cause, and graphically describes the disastrous effects, he forbids the remedy, and strongly cautions against an early or premature opening, although he had himself with success trephined the heads and shafts of the long bones in cases of painful and circumscribed abscess.

That he attempted to give relief in a similar manner in those cases of acute articular osteitis which he so circumstantially describes, is more than probable; and I therefore infer that his caution against the early opening of an inflamed bone, was founded on his experience of ill consequences that followed such a proceeding.

Notwithstanding the teaching of this great authority, I venture to propose interference by operation at the very earliest moment that congestive inflammation of the head of a bone can be fairly diagnosed; and I state with confi-

dence that a perforation made into the cancellous structure, if freely cauterised with the potassa c. calce, will be followed with relief from pain, and that the inflammation which ensues will be only such as is attendant on and accompanies reparative action.

The caustic tunnel may be made at once by cutting down on the bone and piercing the compact tissue with a strong knife, trochar, or small trephine, and then freely cauterising the full extent of the perforation ; or, in less acute cases, a small eschar may be first made, the centre of which being incised, the caustic can be introduced, and, by combining its action with the knife, the tunnel can be carried deeper, from day to day, in a gradual manner. By means of this combined caustic perforation, I succeeded in arresting disease in its first onset in the head of the radius in the case of a young man, aged twenty-four, in the year 1861. Since that time I have tried it with success in several cases of incipient disease, in carpal, tarsal, and other superficial bones.

I perforated the tibia above the internal malleolus in several instances with curative results, also the great trochanter, in cases where its structure, or that of the head and neck of the femur, was the seat of osteitis, the cavity of the joint being yet unaffected.

On the 26th of last April I exhibited a young man at the Surgical Society of Ireland, into whose trochanter a caustic tunnel had been inserted on the 22nd of March preceding, and which was still freely open. The wasted buttock, obliterated fold of nates, and emaciated state of the entire limb, still existed to proclaim the nature of the disease ; but all pain had ceased, the motions of the joint were in a great measure restored, and he walked about before the members of the society without lameness, although for three months previous to the operation his thigh was flexed, he had constant pain in his hip and knee, and he could not admit abduction or any extended motion of the limb. This patient took his discharge to work on the 11th of May, the contour of the limb being almost restored to its natural fulness, and his general health quite recovered.

Although strongly recommending this treatment for the early stages of acute articular osteitis, and also for the very advanced periods when caries is established, or when a whole joint is converted into a foul suppurating cavity, my experience does not warrant me in advising the practice so strongly in the intermediate periods, where the head of a bone may be the seat of a diffused suppuration, possibly communicating with the joint itself. The caustic, I fear, in this condition of parts could not extend sufficiently to protect from the constitutional disturbance and risk of pyæmia that might follow.

The principal merit I claim for this caustic treatment is, that it is a powerful, and, at the same time, the safest means of correcting nature where she is manifestly in error, and of assisting her operations where they are directed aright. And here, sir, I have the boldness to start from out the well-worn professional groove of bestowing a blind admiration upon the proceedings of nature, as seen in her efforts to restore and repair diseases of bone. Instead of the vis mediatrix, which is so perfect, and to be relied on in many of our ills, I assert that she exercises in those affections a vis inimica, a vis perniciosa.

From the first onset of inflammation within the cancellous structure, all through the various destructive processes that ensue, she is engaged in hemming up, and confining the engaged bone, and perpetuating its diseased state, and her reparative operations only commence and become effective when, either by man's art, or by her own late remorseful ulcerations, this imprisonment at the surface is interfered with, and in a greater or less degree removed.

The highest art then of the surgeon is demanded to counteract and remove her mischievous operations from without, and to hasten, open up, and make way for her all powerful reparative actions from within. I am fully convinced that this interference can be more safely and effectually attempted by the combined action of the knife with cauterization, than by the knife alone, and I commend the treatment to my professional brethren with the greatest confidence, earnestly hoping that they will give it a fair trial, and that it may be attended by the same measure of success in their practice, that it has been in my own.

PAPERS ON DERMATOLOGY—No. VIII.

SCABIES.

By T. W. BELCHER, M.A., M.Ch., and M.D. Dub., B.M. and M.A. Oxon.

FELLOW AND CENSOR OF THE KING AND QUEEN'S COLLEGE OF PHYSICIANS; PHYSICIAN TO THE DUBLIN DISPENSARY FOR DISEASES OF THE SKIN; &c.

(Continued from 7th August, 1867—page 128.)

CASE 1.—M. M., a healthy-looking girl, aged 14, was admitted at the Dispensary for Diseases of the Skin on the 30th of July, with scabies of a vesicular character on various parts of the body, but particularly on the hands, and between the fingers. She had all the well-known symptoms of scabies, and attributed the attack of that disease to the cause almost invariably assigned as an excuse for its appearance, viz., sleeping with some one "from the country." The girl was tolerably clean in her clothing and personal appearance, and the disease was only of a few days' standing.

Treatment.—I desired her to take a hot bath ; to wash the body all over with soft soap while in the bath ; to rub in for half-an-hour a sulphuret of calcium lotion, which I shall notice more particularly below ; to wash off the residuum of the lotion, and put on clean under-clothing. This she did, and at her next visit she was, to all appearance, perfectly cured.

Case 2.—J. M., sister of the preceding, and about four years her junior, appeared at the Dispensary for Diseases of the Skin on the 2nd of August, affected with the same disease as her sister, but in a lesser degree. She contracted it by sleeping with case 1.

Treatment.—The same as in Case 1, and with a like result.

I shall now make some remarks on the disease itself :—

The word *scabies*, derived from the Latin *scabo*, is believed to be the *psora* of the Greeks ; is the *gale* of the French ; *kratze* of the Germans ; "the itch" in English ; Scottice *the yuck*; and popularly in Ireland " the Scotch fiddle." What may be its supposed connection with that prince of musical instruments, the violin, it is not easy to determine, nor is it evident why our Scotch brethren should be supposed to be particularly devoted to music of this description. It seems, however, to have been bestowed on them by "the finest pisantry in the world," as Daniel O'Connell was in the habit of calling his and my own fellow-countrymen, at a time when the semi-savage Highlandman of one-hundred and fifty years ago, as described by Sir Walter Scott, was usually presented to ignorant outsiders, as the typical Scotchman. I think scabies is the "*nethek*" mentioned in the original Hebrew of the thirteenth chapter of the book of Leviticus (verse 30.) The corresponding word in the venerable Greek of the Septuagint translators of the Levitical canon is *Thrausma.*

I shall not enter into any discussion about classifying scabies. By various authorities it is held to be vesicular, or papular, or pustular. It is by all held to be contagious —not infectious. All agree in the ordinary presence of the *acarus scabiei*, or itch insect, but some look on this as the cause, others as the effect of the disease. Some think it is always visibly present ; others that it is not always present ; others, again, that it is always present but not invariably visible.

For information on these questions, and also as regards the acarus scabiei, I must refer the reader to my edition of " Neligan on the Skin," pp. 157, &c. In Neligan's Atlas will be found good illustrations of the male and female acarus, respectively.

I may observe that, practically speaking, itch is vesciu-

lar, papular, and pustular. Neligan was of opinion that, originally, the disease was vesicular, and that papules and pustules sometimes appeared as it progressed; also, that while the occurrence of the itch insect is very constant and easily demonstrable, its presence is not necessary to or pathognomonic of the disease.

Most practical men will agree in Neligan's view. Cases of itch do not often occur except in the lower strata of society (though I have known not unfrequent exceptions to this statement); and for the most part, when the aid of a medical man is sought, the patient has so scratched and torn the disease as to render any such thing as regular classification next to impossible.

That eminent writer, Mr. Erasmus Wilson, has stated that the pruritus of scabies is a kind of tickling itching, which is said to be *pleasurable*. I have never met with, or heard of, any one who could say this from practical experience, except "the British Solomon King James I." That monarch had delicious experience of scabies, and he gets the credit of having said "that none but kings and princes should have the itch, for the sensation of scratching was so delightful." However, Lorry, the Parisian, in his great work, "De Morbis Cataneis," was not of King James's opinion, for, on p. 225, he graphically describes the itching as "pruritus enormis et scalpendi desiderium immane."

Diagnosis.—In some cases this is not so easy as might be supposed, and the distinction is important, because the treatment which will cure scabies will very much aggravate affections for which it may be mistaken. Sometimes it is mistaken for eczema, and I have seen that disease in conjunction with it; but in general, eczema does not present the conical-shaped vesicles of scabies, the discharge from eczema is more watery (unless it be eczema impetiginodes), and is accompanied by a mealy desquamation. The papular form of scabies is occasionally mistaken for *lichen;* but the absence of vesicles, and sero-purulent discharge in the latter, make the difference. In lichen, moreover, the eruption does not spread to the most common seat of itch—the flexures between the fingers. *Prurigo* also may be mistaken for scabies; but beside the difference of locality,—prurigo generally affects the trunk, shoulders, and thighs—the small black crusts produced by the scratching in prurigo are characteristic of that disease. Pustular scabies may be mistaken for *ecthyma;* but besides other distinctions, ecthyma is not usually attended with itching. The presence of the itch insect, and the contagious nature of the disease, specially distinguish scabies from all the affections just enumerated, but it may be complicated with any of them.

Prognosis.—Favourable, if well treated; if left without treatment, it shows no tendency to self-cure or wearing out.

Treatment.—Beyond all controversy sulphur, in some shape or other, is *the* means of cure. A reference to my edition of Neligan on the Skin will show the great variety of ways in which the acarus is sought to be destroyed; but to my judgment no plan is at all equal to that adopted for some years in our military hospitals. During the Russian war I served as surgeon of a militia regiment, and had a large experience of the old and new plans of treatment of this disease. Numbers of half-starved, dirty, recruits were daily joining my regiment; and were at first subjected to the old plan of being stripped naked, obliged to lie for days on the floor covered by a blanket, and greased all over with sulphur ointment. The wretched men were at the same time cut off from all communication with the outer world as effectually as the lepers of sacred history.

Soon, however, I tried the new plan, and gave some cases in point in the thirty-third volume of the *Dublin Quarterly Journal* (p. 474). The cases were uniformly successful with me, as they were with Dr. Frazer, who subsequently tried it, and bore testimony to its merits in his work, published in 1864 (p. 68).

The preparation in question is composed of a penta-sulphide of calcium, and a hypo-sulphite of lime, as expressed in this formula:—

$$3\,Ca\,O + 12\,S = 2\,Ca\,S_5 + Ca\,OS_2\,O_2$$

It is made and used as follows:—One part of quick lime, and two of sublimed sulphur, are boiled in ten of water, until the lime and sulphur are perfectly united, stirring meanwhile with a piece of wood, and decanting the mixture into a well-stopped bottle. The patient takes a hot-bath, wherein he may, but need not necessarily be, washed with soft soap; has some of this fluid rubbed diligently into his skin for half-an-hour; takes a second hot bath; comes out cured, and dresses in fresh clothing.

The last part of the process—fresh and clean clothing—is *essential*, for as the disease is notoriously contagious, it is obvious that unless this direction be attended to the patient will, almost to a certainty, contract it afresh.

PURPURIC FEVER, OR FEBRIS NIGRA.

By T. PUREFOY, M.D., Lucan.

During the Spring season of 1867, a vey remarkable, novel, and fatal form of disease occurred in different parts of this county, perhaps appearing first in Dublin. The cases, at the beginning few, subsequently increased, so that the disease assumed the character of an epidemic.

A somewhat similar form of epidemic has already been described by former writers.

The symptoms of this malady have been already so fully and accurately described, that I shall not weary my readers by a repetition of them here, as my chief object is to bring before the Profession some suggestions with regard to the origin and true nature of this epidemic, which has given rise to so much diversity of opinion amongst medical men. Fortunately, all observers seemed agreed in opinion as to the necessity of a strictly conservative and stimulating plan of treatment.

It is a remarkable fact that this new form of disease was, from its first appearance, in many instances complicated with an eruption, declared to be measles by intelligent observers, which disappeared early, whilst the livid dotting of the skin, prostration, and death quickly followed, with or without convulsions or spasms.

In one most remarkable case a young lady about eleven years of age, underwent a continued succession of symptoms, indicating alternately febris nigra, rubeola, arachnitis, and paralysis, yet finally recovered, after severe suffering during a period of several weeks.

This fatal epidemic, now best recognised by the name purpuric fever, declined in frequency and fatality in May and June, but only to usher in a very general and severe outbreak of measles, to hold, as it were, undisputed possession of the field, thus affording subject-matter for serious thought and sober conjecture or speculation as to the true nature of this epidemic.

We find records of a very similar form of disease amongst the older medical authorities, and a modern writer describes a very similar visitation which devastated the western parts of Ireland above a century ago.

All observers seem agreed that it is not identical with the "Black Death" of the middle ages, as described by Heckar.

Two leading questions here present themselves:—

1st. Is the present anomalous and fatal malady a new disease?

2nd. If so, how is it to be classified?

Want of time and ability utterly preclude the possibility of my entering into any prolonged disquisition upon this most important subject, therefore I must be content merely to record my own notions, just as they have resulted from experience and observation, to be canvassed and, as I hope, improved upon by others. During an experience of thirty-three years, wholly limited to this country, I have repeatedly observed anomalous forms of disease, sporadic in character, to precede the appearance of some coming epidemic.

These *precursors* of the epidemic, if such they be, exhibiting with more or less accuracy the leading and prominent symptoms of the supervenient malady.

About two years since, some children, in my Dispensary District, were cut off in the early summer season, by a disease which in its symptoms and progress—fever, pain of the head, vomiting, delirium, early prostration, and coma—clearly pointed out some grave affection of the brain and nervous system, very possibly cerebro-spinal arachnitis.

Upon this occasion I was led to anticipate the approach of scarlatina, and a very severe and fatal visitation of this disease quickly followed.

My experience in reference to cholera is similar.

Various anomalous forms of hepatic, and gastro-intestinal disorder, preceding each return of this fearful malady, yet betraying in their progress, some one, or more, of true choleraic symptoms—as retching, diarrhœa, cramps, spasms, and early exhaustion. The purpuric fever, or, as it is pathologically designated, cerebro-spinal arachnitis, presented, in its progress, some symptoms so much in common with these of rubeola, that the unprofessional and unbiassed observers, have, in not a few instances, set down the disease as simply measles.

In a fatal case of purpuric fever, in the child of a poor woman, lately attended by me, the mother stated that the early stage of her child's illness led her to believe that he had an attack of measles, nor was she alarmed for his safety, until the eruption disappeared, and livid spots upon the surface, cold clammy sweat, and rapid sinking, unexpectedly appeared. This boy of ten years survived about thirty-six hours. His sister, some years younger, took ill on the day of her brother's burial; the measles did not appear; retching, diarrhœa, headache, intolerable thirst, and complete prostration, constituted the early stage of her illness; rapid sinking and livid spots the second stage. Towards the close of life, restlessness was uncontrollable—the head was slightly thrown backwards, but convulsions did not occur, intellect seemed perfect, till death, which took place in twelve or fourteen hours, from the invasion of the illness.

Reasoning upon facts such as these recorded so briefly, I am led to conclude:—

1st—That every epidemic visitation is preceded by constitutional predisposition to disease upon the part of the individuals attacked, similar to the epidemic constitution of Sydenham; and

2nd—That this predisposing cause is always directly depressing in its agency. Hence, one severe epidemic, as fever, or cholera, is very likely to be followed by some other of quite a different character from its precursor, and for the spread of which the population of the infected district have, as it were, been fitted or predisposed.

May not this unusual form of disease, which has trodden in the footsteps of cholera, have been merely an abortive effort in the constitution of the sufferer to pass through the several stages of one of the exanthemata, as measles, the failure of the constitutional powers, and alarming train of symptoms, being the result of some unknown contamination of the system by the preceding epidemic.

The epidemic visitation of measles in the months of May and June has never been equalled in extent or severity since 1849, the period just following upon the widespread and devastating famine-fever of 1848. Some cases of measles were at that period complicated by cancrum oris in a very unmanageable and fatal form. I am aware of the slippery foundation upon which all conjectures and theories stand; yet I do not think that the theory now put forward to elicit the discussion of a most important subject is groundless, or altogether unworthy of consideration.

Death of Two Physicians.—At Penrith, a retired physician, Dr. Allinson, shot himself in his library, and was found lying dead on the floor. Another physician, Dr Jackson, residing in the same town, when informed of the occurrence, threw up his arms in astonishment, fell back, and expired in the arms of a visitor. Both deaths occurred in the same day.—*Standard.*

Hospital Report.

SPECIAL REPORT ON THE TREATMENT OF UNUNITED FRACTURES.

II.*

At the conclusion of our former article, which contained a general preliminary sketch of this subject, we gave a table of the results of operations performed by Dr. Bigelow, Professor of Surgery at Harvard University. The unusual success that has attended this gentleman's practice, entitles his method to further consideration than it has yet obtained in this country. We, therefore, proceed to a description of his usual mode of operating prior to furnishing farther details of the cases already tabulated.

Operation.—The extremities of a false joint should be attacked where they approach nearest to the surface, unless vascular or nervous trunks are in the way; for example, in the arm, upon the outside; a free incision being contrived in each case with especial reference to the ready exit of pus. In the arm, the musculo-spiral nerve, which is often displaced and tied by the lymph, is to be carefully looked for and avoided, and were it not for the care here requisite the bone might be exposed by a single incision. The principal bony extremities being found, the interval, which is sometimes quite irregular and interlocked, is gradually divided, and the ends turned out, the dissection being materially aided by an assistant powerfully flexing the false joint. Care must be taken to prevent the muscles being stripped from the periosteum. When one extremity is fairly exposed, a crucial or other regular incision is made in the ragged callus overlying the periosteum at its tip, which should be then seized by strong-toothed forceps, and efforts made to tear it out of the rugous inequalities of the formerly inflamed bone. As the flaps begin to yield, the terminal adhesions are detached, and the sound bony shaft is reached, where the periosteum is easily stripped from the bone, requiring great care lest the shaft should be denuded higher than the intended section.

The soft tissues being now protected by spatulæ, or flexible strips of copper, the end of the shaft is removed by a common saw, the length of this fragment being determined by the amount of periosteum it has been necessary to detach. Half an inch of good cylindrical periosteum, with half an inch more of ragged tissue hanging at its extremity, has usually covered from three quarters to an inch and a half of bone. Perhaps half an inch of sound shaft, with an irregular or conical extremity varying in extent, is a good rule for the excised piece in most cases. The other extremity is now to be turned out and treated in the same way, and this terminates the dissection.

There now only remains the wire to be inserted. For this purpose holes are bored in each extremity with a good bone drill, larger than the wire, at a little more than half an inch from the end, and through one wall only. A pure silver or plated copper wire is inserted from without inward in one end, and inversely entered in the medulla from within outward in the other. The ends are brought together accurately, and the wire twisted long enough to protrude at the external wound. It is now only necessary to bring the edges of the wound together, leaving an aperture large enough to allow of the free escape of pus, and then to apply a suitable apparatus for retaining the proper position of the parts.

The apparatus for the humerus used by Professor Bigelow, consists of a firm concave splint of iron and leather, made to fit the top and outside of the shoulder as low as the axilla, and thence horizontally to the neck. This is secured by a strap around the opposite axilla. A similar gutter receives the elbow and fore-arm flexed at a right angle; the two are united by a narrow iron strap on the

* Gentlemen who may be willing to furnish reports of cases of ununited fracture to be included in this special report, will oblige by forwarding them immediately to the Editor of the Hospital Report Department, 20, King William-street, Strand, London, W.C.

back, and another on the front of the humerus, adjustable as to its length. The splint can be thus shortened when in place, so as to keep the extremities of the bone in contact, and nearly immovable, in spite of the great leverage of the arm upon the wire, while the dressing can be readily applied in the open interval, without disturbing the apparatus.

For the thigh, a pasteboard splint is moulded to the anterior aspect of the thigh and leg, and then stiffened with dextrine, an interval for the wound being left. The whole limb is then secured to this by bandage ; and surmounting the whole, a Smith's anterior splint is applied, by which the leg is suspended from a railway on a framework over the bed.

Professor Bigelow employs water-dressings at first, and poultices or oakum to absorb the discharge afterwards. He keeps the patient in bed for several weeks, in fact till some stiffening has taken place, after which he prescribes fresh air as an invigorating and osteoplastic agent, together with a diet as generous as the appetite will bear, and not unfrequently the use of phosphates.

The wire is allowed to remain in place until the bone is firmly united, generally during several months ; in no case has evidence of any ill effects from its presence been observed either in producing necrosis or undue inflammation. In some cases it has remained quietly in its place after the arm was in use. In one instance it remained for two years.

To remove the wire, the loop is divided with cutting pliers, and forcibly drawn out ; hence an advantage in flexible wire. This loop is sometimes quite superficial, but in other cases is so deep as to require an incision to reach it.

It has been observed that a partial stiffening, dependent on the inflammation of the soft parts, sometimes takes place in a few weeks, but the bone afterwards becomes gradually loose if the periosteum fails to do its duty.

The one great point in treatment, on which Professor Bigelow has uniformly insisted in his Lectures, is the prevention of abscess, or, in other words, the early and free evacuation of imprisoned pus, by large and dependent incisions, which here, as elsewhere, are less injurious to the tissues than the burrowing of pus. Again, the formation of an abscess is always attended with a certain amount of fever, and the consequent loss of appetite and debility, may materially interfere with the reparative process.

From this circumstance the first signs of inflammation should be vigilantly watched for, and an opening should in all cases be made as soon as any evident pointing occurs.

The most favourable cases for the operation are those in which the patient is in vigorous health, and the bony extremities are of the natural size. In chronic cases the ends of the bone are often tapered from a sort of local atrophy. On this account the incisions may have to be longer, and the whole operation more formidable.

Softening of the bone from interstitial absorption may be looked upon as contraindicating the operation, since we find that the only case in which Professor Bigelow has completely failed, is one in which that unfavourable condition existed, and could not be removed by any treatment, including of course, the free use of phosphates. There is one accident incidental to some of these operations which occasionally supervenes and demands a moment's consideration. We allude to the supervention of paralysis from division of, or injury to, the musculo-spiral nerve. The paralysis will, of course, be more or less complete according to the extent to which the fibres of the nerve have been severed. As the nerve winds around the outer side of the arm it is difficult always to avoid it, and this difficulty is increased in those cases in which deformity has to some extent displaced it. Masses of indurated lymph may also enclose the nerve. It may also be inadvertently injured where so much congestion exists that the wound cannot be kept dry during the dissection. It has further been found at times concealed in a groove of new bone, in separating which it must be divided. This accident has occurred to Professor Bigelow twice. In both cases the power of the paralysed muscles was ultimately restored. It is but fair to remark that this same accident may equally occur in the course of the other operations that have been recommended for the cure of this lesion. In cases of gun-shot wound so much damage is often done to the bone that necrosis is almost inevitable. In reference to this we may remark that Professor Bigelow seems to consider his operation as almost contraindicated where there is complete necrosis, and most surgeons will probably consider other methods of treatment more appropriate to such cases.

We have now cleared the ground of the preliminary matter, and shall be able on a future occasion to enter into the details of the cases we have tabulated.

THE INFLUENCE OF WATER ON THE PUBLIC HEALTH.

ABSTRACT OF EVIDENCE GIVEN BEFORE ROYAL COMMISSION APPOINTED TO INQUIRE INTO THE CONDITION OF THE WATER SUPPLY OF LONDON.

We offer no apology for devoting a large portion of our space to the following very valuable testimony of Dr. Letheby on the "water" question. There are few towns in the United Kingdom of any numerical importance to which the purity of their water supply has not been more or less a matter for earnest consideration. In London several leviathan schemes for water supply, for the consideration of which the Royal Commission have been proposed, and in Dublin a sum of nearly half a million has already been spent in obtaining water on the advantages of which Dr. Letheby's evidence throws much light and no little doubt.

We may shortly summarize Dr. Letheby's opinions as follows: —*Firstly*, he is of opinion that peaty water is not objectionable in any respect but colour, which, however, will prevent its use for drinking purposes ; *secondly*, that the most sparkling and agreeable waters which have been drunk with avidity, in spite of all remonstrance, are generally the most dangerous ; *thirdly*, that there is no evidence whatever that the present London supply is any way objectionable ; *fourthly*, that water contaminated with one-twentieth of its weight of ordinary sewage, becomes, after twelve miles transit in a river bed, as far as can be ascertained, perfectly innocuous ; *lastly*, that the outbreak of cholera in the east end of London was totally irrespective of the water supply.

3859 (*Chairman*). I am Professor of Chemistry in the London Hospital, and also Medical Officer of Health to the Corporation of the City of London.

3863. Do you know the general properties of the water supplied by the metropolitan companies, first, from the Thames Water-works above Hampton, the West Middlesex, the Grand Junction, the Southwark and Vauxhall, the Lambeth, the Chelsea, the New River (Lea springs and wells), and the East London ?—Yes, that comprises all except the Kent Water Company, which supplies a very small portion of the metropolis ?

3864. Is that water taken from the Ravensbourne ?—It was formerly, it is not now, it is taken entirely from wells, not a drop is taken from the Ravensbourne.

3865. You think there is none of the Ravensbourne water in it ?—None whatever. I suppose they have eight or nine wells, and they take the whole of their water from them.

3866. The degrees of hardness of the several waters range from about 13 to 14½ degrees. It will also show the quantity of gases dissolved in the water, the object of that being to ascertain whether the waters are well ærated or not, which is a very important consideration, in a sanitary point of view. The proportion of gases dissolved in water ranges from about 13 to 14 cubic inches, and the most that water can take up is 15 cubic inches. That shows also that the proportion of oxygen contained in the water is very large, considerably more than is necessary to oxidise the organic matter. The water is remarkably well ærated ; in fact, it is so exceedingly well ærated that we find in its passage along the public pipes or mains the atmospheric oxygen dissolved in it really does effect the oxidisation of organic matter, though the water is shut completely out of the atmosphere, which is a proof of the good æration of the

water. The quantity of ammonia in a gallon of water comes to 0·003 of a grain, which is further proof that there is no organic decomposition in the water.

3867. The total quantity of solid matter in a gallon of water ranges from 19¼ grains in the Thames at Hampton to nearly 24 grains which we find in the East London water, and of this proportion the organic matter, as determined by the process called incineration, ranges from about three-tenths of a grain in the East London water to about 1¼ grain in the Lambeth water. But this matter called "loss by incineration" represents other things besides organic matter. The conclusion from it is that the waters are not overcharged with saline matter, for the proportion is no more than is generally found in river waters running from a chalk district.

3869. There is no standard with regard to the quality of the water. It is scarcely possible to take any water which can be regarded as a standard; generally speaking, we may say that a water of over 10 degrees of hardness may be regarded as on the side of a hard water, and when below 10 degrees of hardness it may be regarded as on the side of a soft water, and so on in proportion to those degrees.

3870. Loch Katrine water is undoubtedly very soft water, but on considering a great number of circumstances connected with Loch Katrine water, as the liability of it to organic contamination, and the tendency of it, like all such waters, to act upon lead, and the circumstance that it is so frequently tainted with peaty matter, there are very important objections to its use in such a city as London.

3871. Do you think that peaty water is objectionable to health?—No, but it is so objectionable on account of its colour that Londoners would not drink it. I am satisfied, from my own experience and from the reports of Commissions appointed on the continent with regard to the water supply of Paris and Vienna, that the inhabitants of a large capital, using water for domestic and not for manufacturing purposes, would not drink such water.

3873. The last table of this series shows the composition of the pump waters of the City of London, and you will notice how much saline matter is in them, and yet so strong is the public instinct for waters containing saline matters that we could scarcely keep people from drinking those waters during the time of cholera, when such water was considered to be very dangerous, for the pumps were close to the sewers, and when to prevent their being used the handles were taken from the pumps, the outcry was so great that we were obliged to restore them.

3874. The saline matter which is contained in such waters has a tendency to give them an agreeable taste, and moreover they are generally well ærated waters; they are also free from colour, and are cool and grateful to the palate, and on that account there is as it were an instinctive liking for such water.

3876. Notices have been put upon the pumps stating, "This is a dangerous pump, and the water ought not to be drunk," and indeed the greatest pains have been taken to inform people of the fact that those pump waters ought not to be drunk, but nevertheless they will drink them.

3877. The quality of the water itself as regards its agreeable appearance, its sparkling character, its cool taste, and so on, is what gives to them a liking for such water, but notwithstanding that we have informed them of the danger of using such water, they will still drink it. Four times have I reported, and my reports have been pretty well circulated, as to the danger of the pumps of the City, and yet the public continue to use them.

3879. Having regard to those waters, and the several tests which you have yourself made, what is your opinion generally of the water supplied to this metropolis?—My opinion is founded in the first place upon the actual analysis of the waters over a long period of time, monthly analysis; it is founded in the next place upon an observation of the use of those waters very extensively, and I am bound to admit that there is no evidence whatsoever that those waters are in any way objectionable as a public supply. I am now speaking of the whole of the metropolitan waters.

3880. Notwithstanding the amount of organic impurity that is your opinion?—The organic impurities are not large in the London waters. The loss by incineration, although a grain, is not regarded as a serious quantity, because the loss by incineration represents a great deal more than the organic impurities.

3881. Have you any means of contrasting those tests which you have made with the tests made prior to the companies going up to take their supplies at a higher point?—Yes, I have. In 1851 the total quantity of solid matter in a gallon of water, taking the average of all the Thames Companies was 21·43, in 1856 it was 21·04, and in 1867 19·48. The next set of facts are the most important with regard to the organic and other volatile matter per gallon. In 1851 the chemical commission reported that the average proportion of organic and other matter per gallon was 2⅛ grains as nearly as possible. One of those chemists was again engaged in the inquiry in 1856, viz., Professor Hofmann, and he reports the quantity to be 1·31.

3882. It had improved in five years from 2·46 to 1·31?—Yes, and Professor Hofmann in commenting on that fact, and perceiving that it was common to every one of the water companies, says it is a proof beyond all question of the water having improved in that interval, and that it is not an accident-for the experiments were made on both occasions in the same laboratory and by the same people, and therefore there was nothing in those results that could vitiate or in any way affect the conclusion, viz., that those waters had notably improved between those two periods. The diminution of the organic matter cannot therefore be due to the influence of the season, nor can it be due to any difference in the mode of determining the organic matter in 1851 and 1856. The hardness is reduced also but not much. In 1851 the degree of hardness of Thames water was 14·4, in 1856 it was 13·5, and in 1867 13·3. We have therefore in this table a comparison of the analytical results on the three several occasions when there have been inquiries into the water supplied to the metropolis.

3883. You will observe that the Lambeth Waterworks water contained a larger quantity of organic matter in the year 1867 than in the year 1856?—Yes, in 1856 it was 1·03 and 1867 it was 1·24.

3884. (*Mr. Harrison.*) The East London water from being 4·12 in 1851 was reduced to 1·14 in 1856 and 0·30 in 1867?—Yes.

3891. (*Chairman.*) At the present moment I cannot perceive through the most refined chemical processes the existence of a particle of sewage in the water at Hampton where the Thames Companies take their supply.

3892. You have had your attention directed, have you not, to the fact that the river running through the town of Leicester some years ago was greatly polluted from the discharge of sewage, and that the plants and fish were destroyed for three or four miles down the river. At the end of the third or fourth mile plants began to revive, fish were seen active, and the water appeared in its normal condition?—I have examined most of the rivers in England, and this is the conclusion that has been come to not only in my mind but in the minds of all the engineers who have devoted their attention to the subject, that if ordinary sewage containing we will say nearly 100 grains of solid matter per gallon, such as our London sewage, out of which probably something like 14 or 15 grains are organic, be mixed with twenty times its bulk of the ordinary river water and flows a dozen miles or so, there is not a particle of that sewage to be discovered by any chemical processes.

3896. (*Col. Harness.*) If it did not flow at all what would the effect be?—That does not seem to make much difference. If we place water in a laboratory and stand it in an open vessel in which it is not moving at all we find, in the course we will say of something like twenty-four hours, that oxydization has taken place, and we cannot then discover it.

3898. (*Mr. Harrison.*) Taking the case of the cholera disease and the discharges from the human body being mixed up with the sewage, do you consider that any germs of that disease would be carried down in the water?—At the present moment we do not know what the germs of the disease are. If the germs of the disease be decomposing matter then I do not think that they would exist in the water; but if the germs of the disease be living matter then it is possible that they may exist in the water, but as nobody as far as I am informed can tell us what the germs of cholera are it would be premature for me or anybody to theorize as to the probability or the possibility of their existing in the water.

3900. Have you heard the opinion stated that in the case of the cholera at Southampton the disease had been conveyed by means of the sewage water?—I think it is very likely indeed, my own impression is that the matter discharged from cholera patients is the immediate agent of infection, that if you will take pains to destroy it you will prevent the disease from progressing.

3901. (*Chairman.*) You are aware that it has been alleged that the main cause of the cholera in the east of London was due to the water supply, do you entertain that opinion?—No, I entertain the opposite opinion. It was a matter of duty with me to investigate the whole of the circumstances con-

nected with the East London supply. In the first place it was supplied to the hospital to which I am attached, in the next place it was supplied to the eastern division of the city, where, as officer of health, it was my duty to look well into the matter, and in the third place I had a general interest in it scientifically, apart from any official connexion with the subject, and I was very desirous to ascertain whether or not the water had been in any way concerned in the propagation of the disease. I therefore investigated it very fully.

3902. Are there two distinct waters supplied to that district?—Yes, but I will tell you this with regard to it, there is hardly anybody who can say, except in certain parts of the East London Companies district, whether the water had come from the reservoir at Old Ford or whether it had been received from the filter beds at the Lea, which is considered to be a good water, for the water was oscillating backwards and forwards in the mains in such a manner that the engineer himself had no knowledge what water was in any main at any particular time. But on the other hand there are places at which Old Ford water, and that water alone, is supplied, namely, Stamford Hill, Upper Clapton, Walthamstow, Woodford, Wanstead, Leytonstone, North Woolwich, and Silvertown, and excepting the two last-named places there was no cholera in any of them; there was a little in Silvertown towards the end of the epidemic, but the other places were free from it, and those were the only places where we actually knew that that water did go.

3903. Dr. Farr gave evidence before this Commission to the effect that wherever this particular water was supplied, the cholera was most prevalent in that district, and that they could mark it even to the centre of the street, one side of the street being supplied with one water, and the other with another, and that the bad water was marked by the progress of cholera most distinctly throughout the district? I do not concur in that opinion.

3906. *(Sir B. Phillips.)* You do not think that the cholera was induced by the water supplied to the people at the east end of London?—I am sure it was not. I am satisfied from my inquiries that it did not do so, that it had no more to do with the propagation of cholera than the commercial gas had.

3907. You visited that particular district, did you not?—Yes, I went into it all. In one division of the City there were 62 deaths in the district supplied by the East London and the New River Companies. Now the New River Company's water is above suspicion, nevertheless, of those 62 deaths in that district, there was only a single house in which the East London water was taken; all the rest were supplied with New River water. At my own hospital, the London Hospital, we had nearly 500 people in the hospital, and they drank nothing but East London water. Those patients may be looked upon as people most susceptible of disease, but we had not a single case of cholera arising in the hospital, though we had such a large number brought in as patients.

3908. *(Chairman.)* I will take another instance, which is a very strong one, I think, in proof of the non-connexion of the water with the cholera epidemic. If this water had been charged at any particular time, with this cholera poison, supposing, for one moment that that poison were arsenic or alcohol in the water, distributed over the district, there would be some uniformity in the time of the outbreak, or manifestation of its action over the district, but a month elapsed in several of the districts and no outbreak appeared where this suspected water was being supplied. There is no coincidence of time in the outbreak, and there is no coincidence in the intensity of the disease or in its duration along that district. In the next place, people taking that water and drinking it in its unfiltered state did not get the cholera, while the cholera affected people in that district who did not take that water. At one of the city of London workhouses, the City of London Union Workhouse which is in the Bow Road, they did not take a drop of the East London water, but drank the water from their deep well. I receive, and did receive every week, a return of the progress of disease in that workhouse, and they were decimated by the cholera. Another workhouse, namely, the East London Union, has its workhouse at Hackney where they do take that water, there was not a case of disease there; and then at Stamford Hill, and those places where no other water but the Old Ford reservoir water was pumped—for they have a special power to send it to those places—there was no cholera. I say, therefore, it is a very hasty conclusion, because of the coincidence of the outbreak of disease in that locality with a certain water distribution, to say that the water has been the cause of the disease.

3909. You are not connected, are you, with any water company?—Not at all.

3910. *(Mr. Harrison.)* In the case of the previous outbreak of cholera, in 1854, was there any distinct connexion between the cholera and the water supplied then?—There was, as it appears from Dr. Snow's investigations, and those investigations were, I admit, to my mind so conclusive, that I had no doubt that the foulness of the water at that time had a good deal to do with the propagation of the disease. But it has been found since that the company's pipes were running in such an intricate manner in the district that the companies themselves did not know which houses they supplied with water.

3913. There can be no doubt that the constant supply is a very advantageous thing to the public, chiefly because they would get their water cooler, more grateful, less liable to the pollution to which it is now subject after it is delivered by the water companies.

3915. Soft water is very prone to the absorption of gases, almost immediately, but hard water is not, from the circumstance that hard water contains such a large quantity already dissolved in it that it shuts out, as it were, the other foul gases.

3918. *(Chairman.)* Where the water supplied to the towns is over 10 degrees of hardness, which I look upon as on the side of a hardness, the mortality is only 22·2 per 1000 of the population, whereas in all the towns with soft water, that is with water under 10 degrees of hardness, the mortality is 26 per 1000, and with the metropolitan water it is 23 per 1000. I do not pretend to say that the quality of this water has had anything to do with the mortality, but there is this important fact, which comes from the examination of the table, that certainly soft water does not improve the health of the people, and that many of those towns are very comparable. I take Sheffield and Birmingham to be very comparable with regard to the character of the inhabitants, but look at the mortality in the two places. Birmingham has nearly the hardest water that we have in England, and Sheffield has one of the softest waters, nevertheless the mortality of Birmingham is only 24 in the 1000, whereas you will find that the mortality of Sheffield is 26·2 per 1000. I do not mean to say that the water has anything to do with it, but it shows that there is no evidence of soft water so benefiting the health of the people as to reduce the death-rate.

3921. *(Sir B. Phillips.)* The smallest amount of mortality in this table appears to be at Croydon?—Yes; and it is a hard water they have at Croydon.

3927. *(Mr. Prestwick.)* What do you consider to be a sufficient supply per head of the population?—I think that the experience of engineers generally accords with my own experience of the matter, and I should say that 20 gallons per head for all purposes is a very good and sufficient supply.

3928. *(Chairman.)* Do you mean for all purposes other than manufactures?—No; I mean for all purposes. Taking an average town, taking London for instance, where manufacturing operations are not large, 20 gallons per head is sufficient for London, including everything.

3931. *(Mr. Prestwick.)* For drinking purposes, a moderately hard water is best.

3932. I will take the case of Paris. The commission appointed a few years ago had opportunities of gathering water from granite districts and from millstone grit districts, I believe, as well as from hard chalk water districts; and upon investigating the facts of the case very carefully the French commission concluded that the evidence went to show that the men were finer grown and that less conscripts were refused upon the ground of insufficient stature or something of that kind in the hard water districts than in the soft water districts; and after much consideration of the subject, they recommended the municipality of Paris to take a water which is almost identically the same as the water of London. Very recently I have received from the government of Vienna the report of a commission appointed to investigate the distribution of water in Vienna, and there again they have abandoned soft water, and have taken to a moderately hard water for two reasons, first, that the evidence goes to show that the men are better formed, that the bones are stronger and better formed, and that there is better health in moderately hard water districts than there is in soft water districts; and, secondly, that the public prejudices against water tainted with peaty matter are so great that a large city should never draw its supply from a soft water district.

3933. *(Chairman.)* Lime is not necessary in water to supply bone, is it?—You cannot say that it is not; probably there is

no evidence to show that it is, but there is no evidence certainly to the contrary. Our bones must be made of lime. It is true that milk and the common articles of diet contain generally speaking enough lime to form the young tissues in that respect, but you cannot say how much a hard water or the lime of a moderately hard water contributes to it. And if we are to be guided by what may be termed the Providential evidences with respect to it, four-fifths at least of the earth's surface being calcareous districts, that is to say, districts supplying hard water, one would think that if it had been the case that soft water was better than hard, we should have had it more abundantly distributed to us than it is. There are notions abroad that hard waters have a tendency to produce gravel, but I have investigated that subject and there is not an instance of gravel or any surgical affection of the same kind that I can trace to hard water. My own opinion is that water of between 10 and 15 degrees of hardness is in every respect the most proper water for the supply of a city.

3937. *(Mr. Harrison.)* You would not consider it necessary according to your view to apply Dr. Clark's process to this water?—I should not for I think it would be injurious. If the water were softened by Clark's process, it is not only an expensive process, and as far as I know a very difficult process to carry out on a large scale, for I know of no instance in which more than half a million gallons a day have been softened, but apart from all that the softening process renders the water very liable to attack lead. It did so at Plumpstead to such a degree that they were obliged to replace I believe the whole of the cisterns or nearly so at Plumpstead, at the cost of the Local Board. The carbonate of lime that was in the water was thrown down in the pipes by a process of crystallization afterwards so as to block up the pipes for miles in length.

3945. We have made some careful inquiries upon the proportions of water used in the better classes of houses as well as in the houses of the poorer classes. In fact it was an inquiry instituted by Mr. Simon and Mr. Heywood, the engineer to the Commissioners of Sewers, and this is the result of their inquiries which helps me in my conclusion upon that point. In first-class houses with from 12 to 20 rooms, with good cisterns and baths, and water supply, and waterclosets, and everything, they take upon the average 12·87 gallons per head. In second class houses, belonging to the better class, but still with good cisternage and waterclosets they take 7·41 gallons per head. Then we come to the poor with their bad receptacles, and they take about three gallons per head. Model lodging houses come next, where every appliance is used, and where the water is not stinted, and in those cases it is exactly 6½ gallons per head for domestic purposes. Then as to our workhouses, in the Holborn Union, which is more liberally supplied with water than the other workhouses in London, 5 gallons per head is the quantity, in St. Martin's workhouse 3·68 gallons per head, and in the Clerkenwell workhouse 3·1 gallons per head. We did upon that recommend that in the city of London 24 gallons should be supplied to every room upon the supposition of four people in a room, which is 6 gallons per head. Lately I thought it right to advance it to 30 gallons per room. I believe that engineers even in large manufacturing towns consider that scarcely ever does one half of the water go for manufacturing purposes. Therefore taking all those facts together I think that 18 gallons per head seems to indicate a very good supply for all purposes.

The witness withdrew.

Reviews.

SANDOWN AS A RESIDENCE AND AS A HEALTH RESORT. By H. Maund, M.D. London: Jas. Walton.

In the month of August a pamphlet devoted to one of the most rapidly-rising resorts of the Isle of Wight must have an interest for hundreds who at other seasons would pass it by unnoticed. Those who have never paid a visit to that lovely island should avail themselves of their first opportunity to do so, and not forget to take in their route Sandown, with its fine bay and sands, and its many facilities for yachting, fishing, and bathing. The grand open sea is at this spot unpolluted by the abominations which are so constantly seen in other sea-side resorts, and we learn from Dr. Maund's work that the rate of mortality of the town is exceptionally low—so low as to demand an investigation into the reasons why there have been so few deaths. We do not propose to inquire into these. We are content to find that no local or avoidable cause of disease exists, and that both water and drainage systems are perfect. The climate of Sandown is the most bracing of the southern division of the Isle of Wight. It is not sheltered like the Undercliffe, and is therefore more a summer than a winter resort. Nevertheless, Dr. Maund regards it as the best place in the kingdom for a residence all the year round. Admitting, further, that it has not much *immediate* protection from easterly winds, he believes that the elevated grounds of Kent and Sussex do to some extent protect it. He says in a foot-note at p. 24—

"I once had occasion to make a rapid professional journey from the coast of Kent to Sandown. When I left Kent, one of the most harsh, cutting east winds I ever experienced was blowing, seeming to dry up the hair, and every pore of the skin, and penetrating through the thickest overcoat. When I arrived at Sandown the same wind prevailed, and the residents called it very cold; but to me, it seemed positively warm, and I gladly dispensed with my overcoat. On my return to Kent, the next morning, I was received with the same bitter wind, and I was informed that the weather had been unchanged during the whole time I had been absent. This was one circumstance that strongly influenced me in fixing on Sandown as a residence. The east wind is most certainly modified, either by passing over the comparatively warm waters of the Channel, or some other cause. This difference is also proved by the vegetation, which, at Sandown, extends quite down to the beach; while on the east and south-east coast of England nothing will grow near to the sea."

We should have been glad, had space permitted, to enter on some other inducements to a visit to Sandown. These, however, are all to be found in this pamphlet, which will be very pleasant reading on the sands of that lovely bay, or in the train on the journey thither. We accordingly commend it to those who are anxiously inquiring where to go, merely adding, that the town is a good specimen of the good effects of efficient drainage and plentiful water supply. As the subject of drainage is of such importance, and practical results are so much more valuable than theories, we will conclude with an extract, showing what has been done at Sandown, and what is our author's estimate of the value of the system there adopted.

"Great credit is due to the inhabitants of Sandown and to their representatives, the Local Board of Health, with the limited means at their disposal, for draining the town in the way they have done. They set out with the determination that *no house shall drain into the sea.* The constant system at sea-side towns, of carrying the drainage into the sea, (Sandown stands nearly alone in this respect), is most reprehensible; nothing but custom could induce one to tolerate so filthy a practice. The bather is obliged to bathe in a weak solution, or, in some cases, a tolerably strong one, in more senses than one, of sewage in sea-water; and at low water, when children delight to dig and form mimic castles, forts, gardens, and puddings of sand, and when they ought to be taking in life and health with the pure sea air, they are enhaling the emanations from sand saturated with sewage. Can anything be more intolerable?

"Many towns have gone to a great expense in carrying their sewage in long pipes to low water mark.

"'Those long dirty tubes which crawl over the sands as the tide goes down, like vast unclean centipedes, are an essentially nauseous spectacle, and when the wind sets on the shore, the sea breeze is often anything but salubrious.'—*Times.*

"And now they must undo what they have done, if they mean to keep up their reputation as health resorts. Dr. Brochard, in his work on 'Sea Bathing and Sea Air,' says—

"'In this case, when the tide is out, we may see the filthy tracks meandering slowly along the sand, whilst the sun's rays exhale the stench into the atmosphere, to be drifted back by the breeze, which it pollutes for the delectation of the bathers and promenaders. Now, what is it to have this filth driven back upon the beach with every tide, and the exhalations from it borne in upon the houses with every breath of wind? Is it equalled by the canopy of smoke which innumerable chimneys, steam-boats, and manufactories, cast into the atmosphere of a great city like London? Not at all. *That* is carbon, comparatively harmless; *this* is carbon in combination with the foulest and most poisonous gases, and intensified by the emanations from thousands of men and animals. Upon such a beach it is impossible that little children should enjoy those walks upon the sands, or those paddlings in the water when the tide is out, which, I have already stated, are so eminently profitable for them. Upon an entirely rural beach, far from any considerable

town (a rare case now-a-days), the air possesses the most positive purity anywhere to be found. Entirely exempt from any pollution by the exhalations from living beings, it fulfils all our requirements.'

"The system of drainage at Sandown is double; large drains carry off the surface water, which is harmless. These have outlets on the shore. The sewage is taken by smaller pipes, and is conveyed clear of the town into cess-pits where it is filtered and deodorized by a chemical process. The clear portion finds its way into the sea, miles away from any town; the solid residue, after being thus deprived of its deleterious properties, is mixed with ashes, the sweepings of the roads, &c., and forms a valuable manure, which, doubtless, some day will prove a considerable source of revenue to the town. Sandown may well be proud of her system of drainage."

THE DUBLIN QUARTERLY JOURNAL OF MEDICAL SCIENCE. No. LXXXVII. August, 1867.

We are glad to see that the current number of our respected contemporary, maintains the high reputation of the *Dublin Quarterly*.

The reader will find in it several Reviews, written in its usual able and critical style; as well as reports of several of our professional societies, and information under the head of "Clinical Records."

The "Original Communications" are various and well-selected. Dr. Popham, of Cork, gives an essay on Aphasia; Mr. Wilson, a Paper on the Opthalmoscope; Mr. Kelly, of Milltown, County Westmeath, one on Maxillary Dislocation; Dr. Cummins, of Cork, one on Cholera; Dr. Kidd, one on Chloroform; Dr Purser, one on the Identity of the Fungi of Favus and Tinea Circinata; Dr. McVeagh on cases of more than ordinary interest in private practice; Dr. Belcher on the use of Iodide of Lead in Cutaneous Diseases; and Surgeon Haverty, 52nd Regiment, on the Recent Epidemic.

EDINBURGH MEDICAL JOURNAL. No. CXLVI. August 1867.

Our able contemporary furnishes us with much readable matter, under its usual heads, "Reviews," "Meetings of Societies," "Perioscope," and "Medical News."

It contains the following good "Originals":—

Dr. John Duncan—Treatment of Aneurism by Electrolysis.

Dr. Thomas R. Frazer—Action of Galvanism on Blood and Albuminous Fluids.

Mr. Annandale—Circumscribed Tubercle in Bone and Muscle.

Dr. Davidson—Choreomania, especially as observed at Madagascar.

Dr. Hjaltelin—Treatment of Hydatid Disease in Iceland.

Dr. T. J. Maclagan—Typhus in the Dundee Infirmary.

Registered for Transmission Abroad.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 21, 1867.

Writers who indulge in slander against individuals are liable to a sudden interruption to their career by the injured person's attorney, who frequently threatens, and sometimes succeeds in making them pay heavy damages. Not so they who confine their libellous statements to whole classes. It is a tolerably safe amusement to people of a cynical turn of mind to sneer at their neighbours in the several groups in which society divides them, while those more malignantly inclined have always at hand a method of indulging their spleen by representing as springing from evil motives all the good deeds of the race. A knowledge of this may well incline us to consider of little importance the attacks of those who abound in unfounded assertions. Our profession is continually the butt of every kind of weak ridicule; nor are our foibles, as a body, so few as to incline us to resent as unkind the wit so constantly directed upon them. In fact, we yield to none in our hearty enjoyment of that wit whenever it is of a nature to provoke innocent mirth, and is calculated to incline us to avoid some weakness, or give up something that diminishes our just influence. Far otherwise must it be with an attempt to fasten on our noble profession a charge which, if it could be justified would expose us all to the merited contempt of every other class in society. We believe that, as a whole, there is no body of men more honourable, upright, and self-denying than the Medical Profession. It is on our unrequited labours that the poor depend and their patrons calculate. Charity without us were helpless, withdraw our aid from the magnificent Hospitals, Dispensaries and Infirmaries, of which the great public boasts, and where would they all be? Beyond their range—in districts where they have no existence—on the barren moor where the cottager's nearest neighbours are miles away—in the attic or cellar of crowded cities, beneath the notice of charitable ladies and gentlemen—who but the doctor, faithful to his mission of healing, is seen in every hour of pain, pouring the balm of comfort into the heart of his suffering brothers and sisters, and giving freely to those who have not the wherewithal to pay for it all that long devotion to science has enabled him to bestow? We believe that, as a whole, the public are not insensible to the disinterested nature of our ministrations, and when education shall have spread to the lowest depths of society, and the waifs of humanity shall have learned to reflect, there will be no lack of gratitude in the ranks in which we do not even look for it now.

But, while conscious of all this, it must ever be painful for such a Profession to be denied the respect to which it is entitled by those who, from education, should be leaders of correct opinion. We cannot, then, as jealous guardians of the honour of our Profession, pass by, without indignant denial, a libel on our body that has just been perpetrated by a respectable and usually moderate organ of opinion. The *London Review*, in commenting upon the case of Mrs. Thwaytes, has printed the following unfounded statement:—

"She need not go mad in order to make a ridiculous use of her power. Without the help of monomania, she might have been led into the belief that Dr. Smith was essential to her existence, was her staff and her prop, her wisest councillor, her staunchest friend. He might have persuaded her that he alone possessed the knowledge of her constitution and the secret of her health; and that if she fell into other medical hands, she would presently be involved in incalculable woes. *It is a trick common amongst medical practitioners of the general class to produce this impression on the minds of their patients, especially when they are women;* and Dr. Smith is either to be blamed or commiserated, according as he encouraged Mrs. Thwaytes's hallucination, or combated it in vain. It would have been infinitely better for him and his brother had his patient not conceived that dreadful idea of false identity which has put the well-meaning but unfortunate Smiths out of court."

We have placed in italics the phrase upon which we rely to show that the writer had no intention of conveying an imputation on any individual, but deliberately and intentionally gave expression to what we have no hesitation in pronouncing a most wicked slander upon a most noble and unselfish body of men. We repudiate the accusation on the part of the Profession we represent. We defy the writer to produce the shadow of a foundation for the baseless assertion he has had the hardihood to propagate, and we call upon him in the name of truth and justice to retract the most uncalled-for imputation on the honour of our Profession that has recently sullied the pages of English journalism.

A DISPENSARY ELECTION.

The last election of a Medical Officer for the Ballinakill Dispensary, appears to us worthy of notice as a proceeding, happily hitherto unprecedented, and to be avoided for the future.

The members of the committee met in the Dispensary House, Ballinakill, on the 26th ult., for the purpose of proceeding with the election of a medical officer. The vacancy occurred by the death of Dr. Walsh in February last, and the duties have been discharged since that time by Dr. Fitzpatrick of Ballinakill, who was now a candidate. He was opposed by Dr. Carey. The committee had met several times without being able to come to a decision, but it was believed that an election would take place at Saturday's meeting.

The first fact elicited was, that by order of the Committee the vacancy had not been advertised in any paper except the *Freeman's Journal*. The object of this course will be understood when it is stated that the *Freeman's Journal* is the chief organ of Roman Catholicism in Dublin, and is seldom read by persons of any other religion. The advertising of the vacancy in its columns, was equivalent, therefore, to the exclusion of candidates of any other creed, and is altogether out of the usual course.

"The Chairman said that was a special meeting for the election of a medical officer for that dispensary district; that being so, they would not transact any other business.

"He believed the diplomas of both gentlemen were very good in all respects.

"Mr. Fleming said those of Dr. Fitzpatrick were far superior to those of Dr. Carey. He thought it very wrong that men should come there to oppose a man who had been chosen by the priests, the farmers, and the people, because he was not of their creed. It was a shame that when men of his class had supported gentlemen who were then present in high positions, they should turn round and oppose them in a matter of £100 a year.

"Mr. Fleming—They are against priests and people.

"The hon. secretary (at the Chairman's request), read the list of each candidate's diplomas and testimonials.

"Mr. Marum—Dr. Fitzpatrick has had far more experience in my opinion, although I know Dr. Carey was successful enough in Castlecomer. He would at once take leave to propose Dr. Fitzpatrick as a fit and proper candidate to discharge the duties of Medical Officer in that district. He did so not only in his own name, but as the mouthpiece of the Roman Catholic clergy, and guardians and people of that district, who had testified their anxiety to have Dr. Fitzpatrick. He was very sorry indeed that a religious element had been imported into this election. He repudiated any such feeling on his part; he was actuated by no sectarian motives; and he would put it to those gentlemen even at the twelfth hour, was it worth their while, in a matter of this kind, to oppose the choice of the people, and refuse them the gentleman they themselves had selected?

"Mr. Fleming seconded the nomination of Dr. Fitzpatrick.

"Mr. Brownlow said he had proposed Dr. Carey so recently it was not necessary he should do more than formally propose him again.

"Mr. Bland said he had no objection to second Mr. Brownlow's proposition, and at the same time to reply to some observations that had been made. A correspondence had been printed in the press asserting that they came forward and, actuated by bigotry and dictation, used their privilege to oppose a man because of his different religious belief. From the beginning, he had disclaimed everything of the kind; his aim and object had been to secure the best man not only for themselves, but for the people of the district—to have the candidate best qualified by experience and capacity. As to sectarian feeling, he would remind the meeting that on two occasions he had proposed Dr. Walsh, a Roman Catholic, in that room; and his vote had turned the election in favour of a Roman Catholic in Ballyroan."

By a majority of seven to three Dr. Carey was elected.

The *Leinster Express* informs us that—

"In the street in which the dispensary house stands there were in different positions four batches of constabularly, in all thirty men, with rifles and side arms. Sub-Inspector Tilly was present; and Mr. Rogers, R.M., Tullamore, remained at the dispensary during the sitting of the committee. At the conclusion of the meeting, about 100 young men or more had gathered in the street, and as the members passed out they groaned or cheered as they thought fit. Viscount Ashbrooke, whose way was in an opposite direction from the crowd, was loudly groaned; while Messrs. Domville, Moore, Bland, Cooper, Brownlow, and Edge, as they quietly walked up the street together were vociferously hooted. A number of the constabularly with Mr. Rogers and Mr. Tilly, joined round them and escorted them up the town."

The transaction which we have narrated above is the first attempt to introduce publicly and openly a system of religious coercion into the election of Dispensary Medical Officers in Ireland, and we trust it will be the last. An effort, so scandalous to the system of representative guardians, to pervert the trust which has been misconfided to them, would, in our opinion, fully justify the Poor-law Commissioners in refusing their assent to the election.

From whatever creed the attempt may emanate our condemnation equally applies, and a repetition of this scene would almost justify the Government in transferring to other hands the trust which is so flagrantly misapplied.

THE ENGLISH VACCINATION ACT.

This important measure, which we have several times commented upon during its progress through Parliament has at length received the Royal assent, and will take effect from the first of January, 1868. By it all former statutes on the subject are repealed from the day in which the new

Act will come into operation. The Poor-law Guardians are directed to divide unions and parishes into vaccination districts, or to consolidate or alter them, subject to the approval of the Poor-law Board. The qualification of a vaccinator is to be prescribed by the Lords of the Privy Council, and their Lordships may order, in addition to the fees allowed by the parishes, a further payment not exceeding 1s. for each child whom the vaccinator has successfully vaccinated during the time to which the award of the Lords of the Council relates. The vaccinators are to be paid by the Guardians 1s. 6d. each child, 2s. at a certain distance, and if over two miles, 3s. each. When the birth of a child is registered, or within seven days, the registrar is to deliver a notice of vaccination, and the child is to be brought within three months, and on summary conviction for not bringing the child to be vaccinated, or afterwards to be inspected, the offender to be fined 20s.

Before the Act is in actual operation, our readers will have had full opportunities of studying and discussing each of its provisions. Of these, the first in importance to them, and the only one to which we shall this week refer, is that relating to extra payments—the system of "payment for results," as it has been sometimes styled. This principle was sanctioned by Parliament last year, a grant of £5000 having been devoted to these extra payments. The Act, therefore, which last week received the Royal assent, in this particular only perpetuates a plan that has been already tried. The intention of the grant has been so variously represented, that we cannot better serve our readers than by placing before them the account given by the Medical Officer of the Privy Council, in his report, which has just been presented to Parliament, and which may, therefore, be looked upon as the official statement of the reasons that have led to its complete adoption. He says :—

"The intention of this grant was not to relieve local rates of a part of the costs already chargeable on them for fees to public vaccinators, but to provide, independently of local rates, that meritorious public vaccinators should have their earnings by vaccination increased. There had always been a great deal of complaint from the Medical Profession that public vaccination was not sufficiently paid for. Against this complaint it was argued that guardians had no better means of determining what price to pay for public vaccination than by adopting the minimum price for which duly-qualified local practitioners were willing to contract to furnish it; and that, a certain market price for vaccination being thus fixable, practitioners could not reasonably complain of terms which they had voluntarily accepted, nor guardians properly be coerced by legislation into paying an artificial, protective price for the service. And of course on all sides it would be recognised that, however poor might be the remuneration under contract, the practitioner who had voluntarily made the contract could not plead the poorness of payment as an excuse for imperfectly fulfilling his engagements. Yet, on consideration of the whole case, Parliament, in 1853, had determined that the price to be paid for public vaccination could not, with due regard to national interests, be left an entirely open question between guardians of the poor, on the one hand, and competing members of the Medical Profession on the other. It had fixed a minimum price of 1s. 6d. (with additional rate for distance), below which it should not be lawful for guardians to pay. But the fixing of this minimum (which in practice guardians were very apt to regard also as their maximum) did not satisfy the Medical Profession; and always, when consideration was being given to proposals for amending the vaccination laws, question arose whether the provisions of 1853 as to payments for public vaccination could be so changed as to remove that dissatisfaction. It was found, however, that any statutory fixing of a higher minimum rate for vaccination contracts would be strongly resisted on the part of local authorities; and apart from this kind of opposition, doubts were entertained as to the propriety of pressing any further a principle of legislation so evidently exceptional as one which aimed at protecting the medical profession from the ordinary consequences of competition among its own members. On the other hand, no sensible person could avoid seeing that the national defences against small-pox might be of a most untrustworthy sort, if the business of seeing to them for each locality were virtually assigned by the guardians to the lowest professional bidder. The mischief of such a system would not lie so much in those extreme cases (which I trust would be as rare as they would be scandalous) where a contractor, poorly paid for prescribed duties, might deem himself free to neglect them: it would consist far more in the very extensive unwillingness, which would be engendered, to incur trouble beyond the letter of the contract. And this kind of feeling, as I endeavoured ten years ago to express, would, in my opinion, be the worst of dangers to public vaccination. The national utility of public vaccination depends, to a degree which unskilled persons can hardly imagine, on the condition that its local administrators shall work, not merely as competent perfunctory performers of prescribed tasks, but thoroughly with zeal for their work. And in this point of view it becomes an important public object that the scale of payment provided for their service shall be such as they can accept with satisfaction.

"My Lords, after considering all the circumstances of the case, determined that the best course for them to take was to ask authority from Parliament to give to public vaccinators, under certain regulations, gratuities in excess of their contract receipts. The contract rate might, they thought, remain as heretofore, to be adjusted between guardians and medical practitioners, subject only to the actual statutory provision of a minimum; and they would assume (as indeed no other assumption is practicable) that the contract rate represents a payment which the contracting medical practitioner deems sufficient for his prescribed duties. But, inasmuch as the thoroughly well vaccinated state of the population of a place indicates, almost of necessity, that the contractor exerts himself in various ways which lie beyond the definite obligations of his contract—exerts himself with zeal both to optimise the quality, and also to maximise the quantity, of the local vaccination, therefore my Lords would ask Parliament to allow an annual sum out of which extra remuneration for this zealous work might be awarded under their Lordship's direction."

Notes on Current Topics.

THE HEALTH OF LORD BROUGHAM.

THE various reports that prevailed during the winter as to Lord Brougham's health, at his villa at Cannes, attest the interest that still centres in the veteran President of the Social Science Association. His safe return to England will everywhere be hailed with lively satisfaction. We regret that he should not be so strong as might have been hoped, but, considering his advanced age, there is, perhaps, on the whole, but little cause for disappointment, as the journey from the south of France could not fail to considerably fatigue his lordship.

The *Carlisle Journal* says:—"His Lordship appeared to be in a very feeble condition, considerably more so than on his visit last year, and it seemed to require all his exertions, with the assistance of his valet, to get out of the carriage. Having descended to the platform he sat down in a chair until the train passed on, his only inquiry being as to the state of the weather, and he was then carried across the line to another chair brought for the purpose. With the assistance of his valet he walked the short distance to his carriage, which was in waiting for him, and, having been assisted inside, he was driven to Brougham-hall. We are informed that his Lordship was in as good health as could be expected, but he was suffering from the fatigue occasioned by his journey from London. Lord Brougham will attain his ninetieth year on the 19th of September next."

GREENWICH HOSPITAL.

IT is not improbable that Admiralty will grant the use of the *Infirmary* to the Seamen's Hospital Society, and that thus the contention as to the future Dreadnought will be

brought to a close. There is an idea with many that even this portion of the mass of buildings will be much less useful than a new hospital. We doubt not an appeal to the public would have enabled the Society to erect a good hospital on their own site, though there is no denying that money thus spent might be better employed.

We are glad to observe that the notion of a good Naval Medical School at Greenwich, which we have so often urged is beginning to take root, several of our contemporaries having endorsed our opinion. With such a pile of buildings to dispose of, a noble Naval Hospital and a creditable Naval Medical School might easily be organised, and soon be in good working order, conferring the same benefits on the navy that the army school does on that branch of the public service.

INTERNATIONAL MEDICAL CONGRESS IN PARIS.

A VERY large number of medical men from different parts of the world met, on Friday last, in Paris in the large amphitheatre of the Academy of Medicine, at the first *séance* of an international medical congress. The Minister of Public Instruction has deputed M. Denonvilliers, the Inspector-general of the university, to represent his department, and many of the foreign governments have sent special delegates, *e.g.*, Professor Fréricks represents Prussia ; Dr. Seitz, Bavaria ; and Dr. Barbosa, Portugal. Several important subjects have been placed upon the programme for discussion. On Friday last the president of the executive committee, Professor Boulland, delivered an address, the delegates from learned societies presented their credentials, and lectures were given upon the subject of consumption by Professor Langalli (Pavia), Dr. Villemin (Paris), Professor Crocq (Brussels), Professor Lebert (Breslau), Drs. Maronisse and Sarramea (Bordeaux), Dr. Ullerspergen (Munich), Dr. Homan (Christiania), and others. On Monday the congress was occupied with deliberations upon the subject "Of the conditions which cause death after surgical operations ;" on Friday it will consider "The Prevention of enthelic diseases ;" on Monday (26th), "The acclimatisation of European races in hot climates ;" on Wednesday 28th, "The influence of common aliments in different countries in the production of special diseases ;" and "The influence of parasites that flourish on man." A large number of English medical men have gone to Paris to attend the meetings of the congress.

THE HEALTH OF LONDON.

THE deaths from diarrhœa registered last week were 189, as against 217 in the week preceding. Of these, 177 were deaths of children, and only 12 those of adults. 26 took place in the western districts, 46 in the north, 30 in the central, 44 in the east, and 43 in the south. Besides these, 13 deaths were recorded as from cholera or choleraic diarrhœa. There are no other facts of importance, and these figures therefore supplement the remarks we made on this subject last week. The following fact reported by the Registrar-General is not devoid of special interest:—

"The London sewers will carry off, according to the computation of Mr. Bazalgette, in addition to the sewage, ¼ inch of rain in 24 hours ; but between midnight and 9 o'clock of Friday morning, July 26, 3¼ inches of rain fell, not like a thunderstorm, but by a uniform downfall extending over the whole metropolitan area. London was covered with 26 million tons of water. The tide rose as the storm fell, so that the discharge of the waters by the sewers into the Thames became impossible; and the lower parts of South London were flooded, where at high water the river is 6ft. or 7ft. higher than the streets, and 12ft. higher than the basements of the houses. (See Report of Engineer to the Metropolitan Board of Works, Aug. 9, 1867.)

THE METROPOLITAN RAILWAY.

THE underground railway, or, as it is named, "The Metropolitan," has so long become an established fact, that it is now quite indispensable. Its connections and use have rendered it one of the best paying lines in the kingdom ; but whether it is the most healthy, whether its close and suffocating air may not render it prejudicial to the respiratory organs, if they at all show a tendency to disease, has yet to be ascertained. An inquest was held on a woman who died at the Bishops-road Station. She complained of difficulty of breathing and great pain, and before she could be conveyed to the hospital she was dead. It seems from the post-mortem examination that bronchial disease existed, and it was considered that the impurity of the air on the line had hastened death. If such is the fact, some mode of ventilation ought to be devised immediately, especially as it is well-known that there are escapes from the sewers passing under it and by its side, which render the air more noxious than it would otherwise be. It appears to us, however, that the verdict in this case is little better than the echo of the coroner's opinion, and until some more reliable basis for the statement be produced, the public will pay little attention to it. The statement that the atmosphere of the Metropolitan is dangerous to persons with delicate chests, is of too serious import to the public and the proprietors of the line to be determined by the *ipse dixit* of the coroner, and we suggest that that gentleman, or the company itself, should set public doubts at rest in the matter.

RESCUE FROM FIRE.

LATELY the Royal Society for the Protection of Life from Fire, held their anniversary meeting in the Council Chamber, at Guildhall, when the managing committee resigned their charge, and transferred their plant to the Metropolitan Board of Works, under the provisions of the Fire Brigade Act, 28th and 29th of Victoria. The Lord Mayor presented the prizes to those who had distinguished themselves in saving life from fire during the past year. Since the establishment of this society in 1843 down to the present year, when it relinquishes its functions, 9299 fires had been attended, and 1150 lives rescued. The plant is worth £9000, and has been presented to the Board on behalf of the subscribers, the society receiving only £1414, for the purpose of compensating the society's men who retire. The committee recorded their sincere acknowledgments to their able and zealous secretary and other officers, for the faithful performance of the arduous duties that had devolved upon them.

ACCIDENTS IN THE STREETS OF LONDON.

As conservators of human life and safety, we have, on different occasions referred to the street traffic of London. We have urged the necessity of adopting some regulations by which the serious injuries that are constantly taking place in our public streets might at least be lessened if not altogether avoided. Hospital reports and coroner's inquests are witnesses to the accidents which are repeatedly occurring. On the day of our last issue, an inquest was held by Dr. Lankester, at the Royal Free Hospital on the body of Mr. J. Colton, 86 years of age, who was knocked down and run over at King's Cross. A discussion took

place on the danger of crossing the road there, and after the verdict a resolution was adopted to remind the local authorities of the necessity for regulating the traffic at that place. This is only a specimen of what is taking place in all the crowded road-ways of our metropolis. It is estimated that on an average three lives are sacrificed, and thirty-six injuries, more or less severe, inflicted every week by the manner in which the public traffic is conducted in London. We are glad, therefore, to find that the Metropolitan Traffic Regulation Bill was read a second time in the Commons before the separation of Parliament. It contains a variety of useful regulations, and we hope to see it come into full operation early in the next session.

THE LATE DR. VICTOR BAZIRE.

On the 11th inst., suddenly, died this accomplished young physician, only thirty-two years of age. He had already achieved considerable distinction, and by his qualities of head and heart alike, had endeared himself to a large circle of Professional friends, numbering amongst them the very foremost names. As a graduate, both of the London and Paris Universities, he had obtained at each the highest distinctions, and he might have been reckoned as one of the most rising men in the metropolis. It would have been difficult, indeed, to point out a more promising physician, and we know that he was looked upon as a most desirable addition to the staff of one of the principal hospitals, and it was earnestly hoped he would come forward at the next vacancy. He had for some time been on the staff of the National Hospital for Epileptics, and had formerly been Registrar of the Westminster Hospital. He was, during the current year, the author of a number of Hospital Reports in the *British Medical Journal*, and had formerly contributed to the same department of the *Lancet*. His more valuable literary production was the "Translation of Trousseau, with Notes," one volume of which we received but a few months ago, and another of which had just come to hand. Death has cut short his brilliant career at an early age, and, therefore, what he had already accomplished, can only be regarded as the bud of promise. What might not the full blown flower have been?

SANITARY STATISTICS OF LONDON.

Dr. Letheby's report for the quarter ending June, 1867, has reached us, from which we select the following quotations :—There were 591 births and 478 deaths registered in the city of London during that quarter. These numbers are geatly below the average for the corresponding period of the last ten years, the average proportion of births in the quarter being 755, and of deaths 670. In the East London Union the births were 250 ; in the West, 156, and 185 in the city proper. The deaths were distributed as follows: 170 in the Eastern division of the city, 150 in the Western, and 158 in the Central. In the corresponding period of the last ten years the average mortality in the city has been at the annual rate of 21·9 per 1000 of the population. In the whole of England it has been 21·8 per 1000. The mortality in the city, therefore, during the quarter has been remarkably small, less in fact than that of the small towns and country districts of England. Of these 478 deaths, 152 were of children under five years of age, 40 of persons from five to twenty, 63 from twenty to forty, 89 from forty to sixty, and 134 at sixty and upwards. The chief causes of death are as follows :—78 from phthisis, 20 from tabes and scrofula, 8 from hydrocephalus, 74 from pneumonia and bronchitis, 18 from continued fever, 2 from scarlet fever, 9 from small-pox, 3 from measles, 21 from whooping-cough, croup and diphtheria, 5 from erysipelas, and 9 from diarrhœa—of which 6 were deaths of infants. Most of these are greatly below the average for the season; phthisis, for example, has declined from 91 to 78, tabes and scrofula from 41 to 20, hydrocephalus from 22 to 8, alvine disorders of adults from 10 to 3, continued fever from 26 to 18, scarlet-fever from 18 to 2, measles from 21 to 3, whooping-cough, &c., from 48 to 21, and bronchitis and pneumonia from 104 to 74. The sanitary condition of the city, therefore, as indicated by these returns, has been remarkably good, better, in fact, than in any preceding quarter. The meteorology of the quarter, Dr. Letheby remarks, will hardly serve to explain this improved condition of the public health ; and after stating the proportionate degree of temperature, the atmospheric pressure, the large amount of rain, and the humidity of the air, he observes, "the season, therefore, has been wetter and a little warmer than usual, and this perhaps has had a salutary effect." He states also that the work of sanitary inspection has been pursued with unusual vigour ; no less than 6547 houses have been inspected during the quarter ; numbers of them have undergone sanitary improvement. There have been notices for cleansing and lime-whiting, cleansing and repairing privies, amending drains, improving the water supply, supplying water to closets, abolishing cess-pools, the disposal of waste water; and for other sanitary defects, as overcrowding, accumulation of dung, bad paving of cellars and yards, &c. The markets and slaughter-houses, and cow-houses of the city have also been inspected, and no less than 98,728 lbs., or rather more than 44 tons, of meat condemned as unfit for human food, besides game and poultry, and fish. These are labours which cannot be too highly prized, and which, no doubt, have contributed largely to lessen the mortality of the quarter. The city cannot be too proud of an officer so capable, and whose duties are so indefatigably performed.

UNIVERSITY OF EDINBURGH.

The annual ceremony of capping the graduates took place on the 1st of the month at Castle Hill, when Sir D. Brewster presided, and Professor Syme, the promoter, addressed the students. This address, which we regret not to have been able to report at present, urged upon those who had attained one object of their ambition—the possession of a degree—the pursuit of their profession so constantly and zealously as to maintain the position they had won, and entered further upon their several social relations and duties in a manner that is not likely to be readily forgotten. We trust the lessons inculcated by the learned professor may be carried into practice by the numerous gentlemen who, on that occasion, received the degree of the Edinburgh University.

VIVISECTION.

The prevalence of operations of this kind in France, and the extent to which they have been carried, have excited attention, and led to remonstrance in this country. A strong feeling has been awakened against the cruelty which has been inflicted on the victims of such practice. The answer is, that it is justified on the ground of its necessity in the interests of science. Without stopping to decide on the morality of this plea, we simply insert the following from the report of the international congress for the protec-

tion of animals, held at Paris this year—"Dr. Richardson gave a short lecture on local anæsthesia in veterinary operations. He performed a number of experiments with rapid and entire success, in illustration of his argument, passing a small seton needle through the arms of Dr. Fraser and M. Decroix, and making a very large surface of his own arm insensible. The experiments created quite a enthusiasm. The author stated, finally, that there was no justifiable operation on an inferior animal which could not be performed painlessly by the local method—an announcement which was received with a general expression of approval."

THE FATE OF A PAUPER.

An inquest has been held on a pauper of the advanced age of seventy-four, the verdict of which we commend to the attention of every one. It is in the following terms :—

"That the deceased died in Bethnal-green Workhouse from the effects of acute inflammation of the lungs, and the said jurors do further say that the death was caused or accelerated by putting him to work in the cold and rain ; and they do lastly say that the superintendent of labour is highly censurable for putting him to work when the medical officer said he could not work."

The cause of the sick poor is evidently not yet triumphant. A question in the House of Commons has elicited the fact that the Poor-law Board have sent an inspector to report on the case, but that the officer implicated had resigned. If the Poor-law Board should suffer any resignation, or any other act, to interfere with a thorough investigation and a publication of the facts, it will be guilty of a gross dereliction of duty.

THE FAMINE IN ORISSA.

The evidence taken by the Commission of Inquiry in reference to the effects of this famine, discloses the most distressing and, in some instances, the most horrifying state of things. The mortality was fearful. Corpses by hundreds were found lying in the field, sometimes the jackals eating them. Men and carts in large numbers were kept to collect the dead bodies, which were first cast into a pit, but afterwards thrown into the river, and floated out to sea. Some idea may be gained of the misery inflicted by this scourge from what is reported by Dr. Jackson, Medical Officer of Balasore Civil Station. He says :—

"People used to lie down under the trees at night to sleep, and to be found dead there in the morning. Cases occurred in which people fell into the water from debility when they went to drink. I saw a woman lift up her arm and let it drop while a dog was pulling at her entrails and eating them. People died in the roads and fields all about. Many died without being seen. Latterly we discovered that a great part of the famine mortality was due to an extraordinary tendency to frightful worms, which produced false appearances of cholera and other diseases. At the hospital, the mere occupation of throwing the dead bodies into a pit and covering them with earth was more than enough to employ every mehter we could get, the mehters being the only caste in the district who would touch dead bodies." Our Calcutta correspondent mentions three instances in which human flesh was eaten.

Legal Intelligence.

NORFOLK CIRCUIT—CROWN COURT.

(Before the Lord Chief Justice, August 13.)

ILLEGALLY RECEIVING A LUNATIC PATIENT.

Frederick Willis Hone Milburn was indicted for receiving and taking charge, as a patient, of the Reverend James Alexander Barnes, a lunatic, not having legal authority to do so.

The prosecution was instituted by the Commissioners of Lunacy, under the 8th and 9th Vict., c. 100, s. 90, which provides that no person shall receive to board or take charge of any patient as a lunatic, without order or medical certificate.

The defendant was in the year 1860 living in London, being engaged in the business of receiving lunatic patients. In consequence of an advertisement inserted by him in the papers, a communication was entered into that year between him and some members of Mr. Barnes's family, and the result was that Mr. Barnes was put under his care. Mr. Barnes, who is the rector of Gilling, a living belonging to Trinity College, Cambridge, of which College he was once Fellow, is brother to the late Mr. Keith Barnes, member of the firm of Lyon, Barnes, & Ellis, now Ellis & Ellis (of Spring-gardens). Mr. Keith Barnes, from a correspondence that was put in and read, arranged with the defendant that he should take charge of his brother at a stipend of £500 (which was afterwards increased to £600) per annum ; and Mr. Barnes having been removed to the defendant's house, the defendant left London and went to Aldringham. By some means, which did not exactly appear, the attention of the Lunacy Commissioners was directed to the defendant's house. They sent down one of their members, Mr. Cleaton, who, with two other gentlemen, visited the place and had an interview with Mr. Barnes, which left no doubt on their minds that he was quite insane. There seems to have been not the least doubt that Mr. Barnes was insane at the time he was received by the defendant into his house, and that he was treated with proper care, consideration, and kindness while under his hands ; but as it was proved that no licence to hold a house for lunatic patients had been granted by the magistrates of the district in which Aldringham lies, nor any certificate forwarded to the Commissioners of Lunacy, this prosecution was instituted.

These facts being established, the jury found the defendant *Guilty*.

His Lordship, taking into account that there was no doubt about the insanity of Mr. Barnes at the time he received him, and that the family were anxious that he should be put under the defendant's care, said that he should pass a sentence which would meet the justice of the case. The defendant had broken the provisions of a statute which was of a most wise and salutary nature, though there was no doubt that he had treated his patient with care and humanity. He must therefore pay a fine of £100, and be imprisoned until it was paid.

The fine, which was afterwards reduced to £50, was paid early next morning.

Summary of Science.

(Specially Edited and Compiled for the Medical Press and Circular.)

By CHARLES R. C. TICHBORNE, F.C.S., F.R.G.S.I., &c.

[The Editor of this Summary wishes it to be understood that he is not responsible for the ideas, theories, or the correctness of the statements made in any of the papers quoted in this Compilation.]

"THE CHEMISTRY OF THE FUTURE."

Sir Benjamin Brodie's discourse "On the Mode of Representation afforded by the Chemical Calculus as Contrasted with the Atomic Theory."

The following notice is an epitome of this communication. Although the production of one of our most eminent chemists, it is doubtful if Professor Brodie's chemical calculus will be of much practical use to the science, but we should be wanting in our duty to our readers, if we omitted to give a report of this important paper. The author said that he was about to speak of a method of representing the facts of chemistry in a manner fundamentally different from the method at present in use. He then passed in review the different theories of chemistry. First, we had Phlogiston. Lavoisier, however, shattered Phlo-

giston. For no inconsiderable period after this, chemists appeared to have worked without a theory, that is to say, that as, during the long alchemical ages, chemists were occupied in collecting together those facts which were afterwards to be embodied in the theory of Phlogiston; so for a period of thirty or forty years—from the time of Lavoisier to the time of Dalton, chemists were employed in collecting together that exacter system of facts which was to form the basis of a far wider and nobler theory—the great atomic doctrine. Davy appears to have worked, and to have made his discoveries without a theory. He would never admit the atomic theory, but rested content simply with the facts of numerical analysis. In the atomic doctrine which appeared in "A New System of Chemical Philosophy" (1808), Dalton took up the conception of combination which had been introduced into the science by means of the theory of Phlogiston.

From the point of view of the atomic theory, chemists have worked for more than sixty years. "I cannot say," continued the lecturer, "that this has been an unremitting progress. It has rather been a succession of events." He then referred to the symbolizing of chemical combinations by balls and wires, &c., and "said that chemistry must have got upon a wrong track, and that it really could only be a series of errors and misconceptions which could have landed us in such a bathos as this." Now, any person who seriously attacks these ideas is bound to show some better way of representing the facts.

In constructing any calculus or method, the principle to be observed, in regard to the symbols, is by no means to give them their arithmetical meaning or interpretations, but simply to construct them properly according to the laws which they obey in arithmetic and in Algebra.

The introduction of symbols of operations into chemistry was a distinctive feature of the author's method which he had accordingly termed "calculus of chemical operations." His object was to express, by means of symbols, the operations by which chemical substances were made, or rather those by which gaseous matter was made.

The fundamental conception of his ideal chemistry, was that all chemical substances were brought into the gaseous condition. The simple relation existing between the combining volumes of different gases had, of course, suggested this foundation for his system. Every gas was measured at 0°C, and at 760 mm pressure. The two units employed in his system were thus defined—

A unit of ponderable matter was that portion of ponderable matter which, in the condition of a perfect gas, at the temperature of 0°C, and under the pressure of 760 mm occupied the space of 1000 C C.

The unit of space was 1000 C C, divested of all matter whatever. It might be represented by symbol 1, and the matter in it was, of course, 0. Hence the paradoxical expression 1=0, but this meant simply that the unit of space was space, and contained no matter. We next required a symbol to represent putting matter into the unit of space; let the symbol be x—x 1 then represents the operation of putting matter of a certain density into the unit of space at 0°, and 760 mm. The same kind of matter at double the density, and contained within the same space, but still, under the same conditions of temperature and pressure, would be represented by x x 1, or $x^2 1$; of three times by xxx 1, or $x^3 1$. Again, another kind of matter might be represented by y, then y^1, $y^2 1$, or $y^3 1$, would signify the unit of space filled with matter of y under its ordinary density, or double, or three times this density, but always under the same conditions of temperature and pressure. These symbols might be combined thus—x y 1 would mean the unit of space filled with x and y at the same time, but under the normal conditions. The symbols, then, representing weights and kinds of matter—x and y—might be said to be operations of combination.

Let A be the matter of x, and B the matter of y, then x would mean the operation of combining A, and y would mean the operation of combining B—x 1 then would mean, "combine A with the unit of space;" and y x 1 would represent, combine A with B in the unit of space.

By this mode of constructing symbols, we might represent such facts as the following:—

2 vols. of hydrochloric acid contained the same ponderable matter as 1 vol. of hydrogen and 1 vol. of chlorine; or to express similar facts in the language of the calculus—*2 units of space of ammonia contain the same ponderable matter as 3 units of hydrogen and 1 unit of nitrogen.*

It is necessary to start with some hypothesis on which to found symbols. The hypothesis is that the unit of hydrogen was a simple weight resulting from one operation. Taking a as the symbol of this unit, then oxygen would have to be represented by a symbol indicating that it was found by two operations thus, ξ^2, water $a\xi$; chlorine was made by three operations, $a\chi^2$; nitrogen, $a\nu^2$, was made by three operations; ammonia, $a^2\nu$, by three. These symbols were in fact condensed equations.

The following formulæ are selected from a long list given by the lecturer to illustrate his subject—

Symbols of the Units of Chemical Substances.

Unit of space	1	Chlorine	$a\chi^2$
Hydrogen	a	Hydrochloric acid	$a\chi$
Oxygen	ξ^2	Iodine	$a\omega^2$
Peroxide of hydrogen	$a\xi^2$	Carbon	κy
Sulphur	θ^2	Alcohol	$a^3\kappa^2\xi$
Sulphuric acid	$a\theta\xi^4$	Tetrachloride of carbon	$a^2\chi^4\kappa^2$

The discussion that followed this paper contained some points worth noticing.

Dr. Frankland remarked that he did not believe in atoms, "nor do I believe in the existence of force." The speaker went on to remark that we do not express in our chemical formula, and in our chemical symbols, the idea of the *force* which has been involved in the operations expressed in those chemical compounds to which we apply the formulæ. He was of opinion that we might seek in vain for this element in the new development (Sir B. Brodie's.) "If we take two well-known chemical compounds, viz:—nitric and sulphuric acid," said Dr. Frankland, "we know with certainty that in the case of nitric acid the hydrogen present can be taken out of it in one piece only, whilst in the sulphuric acid you can take out the hydrogen in two pieces. Now, when we look at the formula, $a\nu\xi^3$, and sulphuric acid $a\theta\xi^4$, we find in both these the same expression for the hydrogen, so that there is not contained in this the same amount of information contained in the old notation. Dr. Odling remarked that some do, and some do not believe in atoms, but that it still remained true that our notation was based upon the atomic theory, and that without the atomic theory our language had no meaning whatever. One of the advantages of the new method was that it was not inconsistent by any means with the atomic theory, but at the same time was not based upon it. The new system is the first in which all prime factors can be written by an integral number. Mr. Foster said he thought the point which must strike chemists at first sight as the most interesting results of Sir. B. Brodie's method was that it enabled them to arrive at the conclusion that some elements were compounds. This, however, was not the first time it had occurred in the history of the science, that chemists had arrived at the conclusion by reasoning that some substances whose elements they did not know were compounds. For instance, before it was known that the alkalies and the alkaline earths could be separated into oxygen and a metal, the majority of chemists were pretty well convinced that they were compound substances. With regard to chlorine itself (hydrogen would appear to be contained in all the haloid elements, according to the formulæ of Sir B. Brodie), that substance was at its very discovery viewed in a manner which was analogous to, if not in point of fact, identical with the views which were indicated by Sir B. Brodie's notation. Hydrogen, hydrochloric acid, and chlorine, were regarded in early times as bodies which formed a series with each other—hydrochloric acid being exactly halfway between hydrogen and chlorine.

Mr. F. O. Ward, in a letter since published in the *Chemical News*, attacks Sir Benjamin Brodie's position. He questions whether the volumetric relations of bodies are so symmetrical as is our present disposition to suppose. As regards the new method, he says the chemical world is invited to embrace a new theoretical system, which incorporates, as an essential part of its fabric, the affirmation that several bodies not yet decomposed, are compounds of a known with an unknown element; and further, as regards the known elements themselves, that they are the results, some of one, others of two or more "operations," strangely likened to so many "strokes on a bell." "It would ill befit a mere student like myself, of some of the simpler parts of chemistry, to criticise proposals brought forward by a recognised master of the science. Yet my admitted inferiority leaves me all the freer to confess that my dim conceptions of elementary matter, derive no light from the suggestion that in a 'chemical operation,' the evolution of hydrogen is attended, as it were, with one sound, and that of oxygen with two." "So, again, I may frankly avow, that to me the proposed

substitution of Greek for Roman letters in our chemical symbols and formulæ, seems likely to impart to our hitherto attractive science, an abstract of abstruseness uncompensated by any real addition thereby made to the profundity of our knowledge. If symbols of chemical combination and severance be needed, why not devise some simple forms of expression for the purpose, as, for example, marks of parenthesis, ordinary and reversed, the former for combination (H A), the latter for decomposition, H)(A. Surely this, or some equivalent expedient, would be more philosophical than the forcing into an artificial quasiconnexity of facts and conceptions so utterly incongruous as to be absolutely incomparable. As for the new fundamental definition of a chemical phenomenon, it is "an operation on the unit of space, the result of which is a weight." I confess that for me the play of words throws not the faintest ray of light on any of the familiar marvels of chemistry, such as solution, effervescence, crystallization, explosion, and all the numberless transformations of form, colour, combination, properties of which collectively make up our astonishing science.

In what sense is the above definition more luminous, more explanatory of the wonders amidst which we move, than if one should say conversely that a chemical phenomenon results from the operation of a weight (or weights) within given limits of space (and time). There is no limit to the multiplication of such abstractions, and if that now propounded gains acceptance I cannot see why to-morrow a new transcendental school may not be started, with a modified "fundamental definition," declaring a "chemical phenomenon" to be an "operation upon the unit of time, the result of which is a force."

Like my chemical betters, however, I wait, before finally judging the new system, its full and complete development; and I shall be found amongst its first and most grateful devotees, should it open up new spheres of really positive reasoning and research, and tend to facilitate "thought associated with experiment" (Faraday's pregnant phrase).

CHEMICAL COMPOSITION OF THE MUD FROM THE STREETS OF THE CITY OF LONDON, BY DR. LETHEBY.

It was first ascertained that the amount of moisture in the street-mud varies to a considerable amount according to the state of the weather, but it is rarely less than 35·3 per cent. of the weight of the mud in the driest weather—the average of ordinary weather being 48·5 per cent, and in wet weather it ranges from 70 to 90 per cent.

It is very probable, says Dr. Letheby, that the average proportions of horse-dung, abraded stones, and abraded iron, in the mud from the stone-paved thoroughfares, is about as follows:—

Horse-dung	57
Abraded Stone	30
Abraded Iron	13
	100

The mud was in every case so finely comminuted that it floated freely away in a stream, and the inference is that it would not subside to any great extent in a sewer with a moderate flow of water.—*Chemical News.*

CONSTITUTION OF THE PHOSPHITES.

Phosphorus acid was discovered by Sir H. Davy in 1812, and its salts (the phosphites) have been examined by Berzelius and H. Rose. Some papers were also published by A. Wurtz in 1842 and 1843. A. Wurtz asserts that the salts contain only the elements of one atom of water. M. Berzelius and H. Rose said that many, at least, contained the elements of two atoms. Mr. C. Rammelsberg (*Journal of the Chemical Society*, July) has examined the properties of phosphorous acid and the phosphites with a view to the solution of these and other questions. He has examined the following compounds of that acid:—

Phosphite of Barium.—Trichloride of phosphorus mixed with chloride of barium gives a precipitate of this salt on the addition of ammonia. Composition—$H_4 Ba_2 P_2 O_7$.

Phosphite of Strontium is a white crystalline powder containing two molecules of water which are given off at 200°. Composition $H_4 Sr_2 P_2 O_7 + 2aq$.

Phosphite of Calcium.—Same as the preceding salt, except that when dried at a gentle heat it loses one molecule of water.

Phosphite of Magnesium.—Is more soluble in cold than in hot water, therefore must be precipitated by boiling. Composition $H_4 Mg_2 P_2 O_7 + 12aq$. The twelve equivalents of water are expelled at 200°.

Phosphate of Nickel.—Green precipitate, $H_4 Ni_2 P_2 O_7 + 6aq$.

Phosphite of Cobalt.—Fine red precipitate, which becomes blue on drying at 250°. Composition of red precipitate $H Co PO_3 + 2$ aq.

Phosphite of Zinc.—$HZn PO_3 + 4$ aq.

Phosphite of Cadmium.—$3H Cd PO_3 + 3$ aq.

Phosphite of Copper.—Blue crystalline salt, $HCa PO_3 + 2$ aq.

Phosphite Iron.—(Ferric phosphite) a diluted solution of trichloride of phosphorus mixed with a convenient quantity of carbonate of soda, but still acid, is precipitated by iron alum. Composition $H_3 Fe P_3 O_9 + 9$ aq.

Phosphorous acid, therefore, forms two series of salts. 1st, Sodium, ammonium, cobalt, manganes, zinc, cadmium, copper, lead, iron, and magnesium ($H Mg PO_3$), which correspond with the potassium salt $HK_2 PO_3$). 2ndly. The barium, strontium, calcium, magnesium, nickel, and zinc salt [$H_4 Zn_2 P_2 O_7$]. The hydrogen of these salts cannot be replaced by a metal, they are not acid salts.

"I find it," says the author, "more accordant with the observed facts to assume that all phosphites contain their hydrogen combined with oxygen in the form of water, thus:—

$$\left\{\begin{matrix} R_2 P_2 O_5 \\ H_2 O \end{matrix}\right. \quad \text{and} \quad \left\{\begin{matrix} R_2 P_5 O_2 \\ 2H_2 O \end{matrix}\right.$$

The water existing in an intimate or intrinsic connection with the molecules $R_2 P_2 O_5$"

FORMATION OF ORGANIC ETHERS.

It has been known for some time that chloride of tin ($Sn Cl_4$) combines with alcohol, and on heating forms ether and chloride of ethyl.

If alcohol is mixed with an equivalent of acid, and if chloride of tin is then slowly added compound ethers are formed according to the formula:—

$$(C_2 H_6 O)_2 Sn Cl_4 + 2 C 2 H_4 O_2 = \left\{\begin{matrix} 2 C_2 H_5 \\ C_2 H_3 O \end{matrix}\right\} O + SnO + {}_2 HCl + HO$$

Benzoice ether has thus been obtained in almost theoretical quantities. Formice, acetic, butyric, palmitic, stearic, lactic, and tartaric ethers, have been produced in the same way.

Fire Clays.—Under the names nacrite, pholerite, and steinite, many different observers have noticed tabular crystals of rhombic form, compacted for the most part into plates and bundles, and usually of microscopic size. The researches of Johnson and Blake now show, first, that all these minerals are referable, with few exceptions, to one and the same species, for which they propose the name Kaolinite; and, secondly, that the common clays, or, at the least, their purer varieties, are little more than aggregations of crystals of the mineral in question.

Johnson and Blake have examined with the microscope some twenty different species of pipe-clay, kaolin, and fire-clay. In all these samples they have found a larger or smaller proportion of transparent plates of crystalline kaoline, and in most of the specimens the plates make up the great bulk of the substance. They account for the plasticity of clay from this cause.

The last number of the Proceedings of the Royal Society) No. 93) concludes the 15th volume, and extends from January 1866 to May 1867. It contains the following valuable communications:—

On the Genera Heterophyllia, Batterslyia, Palæocyclus, and Asterosmilia; the Anatomy of this species and their position in the classification of the *Sclerodermic Zoantharia*, by Dr. P. M. Duncan.

M. M. Milne, Edwards, and Jules Haime, have classified the Madreporaria. Dr. Duncan remarks, that although their classification is admitted to be the best, still there are great gaps in the succession of the genera, and that, moreover, some genera cannot be placed. The author goes on to state that his discovery of a genus "Asterosmilia," unites the Turbinolides and the Astraides. He describes the species—

A Tabular form of Analysis to aid in tracing the possible influence of Past and Present upon Future states of Weather, by S. Hoskins, will be read with interest by meteorologists.

"*Further Observations on the Structure and Affinities of Eozoon Canadense*," by W. Carpenter, is a further defence of this doubtful foraminifera.

"*On the Intimate Structure of the Brain*," by J. Lockhart Clarke.

In a paper on *Pyrophosphoric Acid, and the Pyro and Petraphosphoric Amides*, Dr. Gladstone remarks that Pyrophosphoric acid is, in the notation now generally adopted, $P^2 H^4 O7$, and that, in an examination of its ferric compounds, he found evidence of the existence, in solution, of a double salt, $P^2 Na^2 Fe^2$

O7 (Williamson's Ferricum fe = 18·66). A more remarkable fact is, that the complete ferric salt, and several other pyrophosphates, can exist in an allotropic condition. Thus pure P_2 fe_4 O_7, prepared by double decomposition, dissolves readily in dilute sulphuric acid ; but on heating the solution it separates in a form which is almost insoluble in the acid. When these allotropic salts are decomposed, the acid produced appears to have the ordinary properties. It is a pyrophosphate which is formed when oxychloride of phosphorus is attacked by a strong aqueous solution of an alkali.

Correspondence.

DEAUVILLE-TROUVILLE, CALADOS, NORMANDY.

(FROM A CORRESPONDENT).

I arrived at this charming watering-place on Wednesday last for the first time, and although I had often heard much in favour of it from various friends, I freely admit that I was agreeably surprised with both its natural and acquired advantages.

Deauville, which, thanks to the exertions of the Duc de Morny and our distinguished fellow-countrymen, Sir Joseph Olliffe, has sprung up into its present importance within the last six (!!!) years, occupies a considerable portion of the celebrated valley d'Auge, and is separated from the old seaport town of Trouville, by the river Touque. The beach of Deauville, which is composed of the finest sand, is an English mile and a quarter in extent. Just above the beach a grand terrace road has been formed, which is lighted by gas at night. Along the terrace some very handsome residences have been built, amongst others by the Duc de Morny, the Count de Gontaut-Biron, M. Arthur, the Prince Demidoff, Sir Joseph Olliffe, M. Boittelle, M. Donon, Mr. Breney, the Mayor, the Count de Choiseul, M. Poisson (Recevue Gen. de la Manche), Salamon (Mis de), E. Dalloz, dèputé, and many others. There are also within view a Catholic and a Protestant Church, which add much to scenic effect.

Sea-bathing can be enjoyed in Deauville during the season, which extends from July to the end of September, at any hour independent of the tide, machines drawn, when necessary, by horses being at all times at command, and the proprietary have lately, at a vast expense, erected admirable baths, where visitors can procure, at a moderate charge, either hot or cold, salt or fresh water ordinary baths, Russian baths, douches of all descriptions, together with medicated baths of every kind.

The views from Deauville, whether towards the sea or inland, are unrivalled—thus, in looking out to sea on a clear day, one observes Havre with its well-chiselled point, lighthouses, and harbour on the extreme right, whilst turning to the left the eye rests, in the distance, on the mouth of the Orne which leads to Caen.

Within a couple of miles of Deauville are the old and curious ruins of the Castle of Bouneville, the favourite residence and stronghold of William the Conqueror, and the neighbouring old church of Torque, the church in which his vassals took the oath of allegiance previous to his expedition to England, which resulted in the defeat and death of Harold on the battle-field of Hastings.

If, on the other hand, you turn your back to the sea, you will observe "The Terasse de Deauville," with its villa residences, backed up in the distance by the undulating and tree-clad hills of Deauville, which give a very picturesque appearance to the place, and which, by affording shelter to Deauville, render it a very suitable residence for invalids labouring under certain forms of pulmonary disease.

Deauville is well-supplied with abundance of pure water, brought down in pipes from the hills.

Many are the amusements which have been provided for visitors to Deauville—thus, it possesses a Casino, with its billiard, ball, music, reading and coffee-room, an excellent band from Paris plays twice each day at certain hours, and balls are held here twice each week. Deauville possesses also an excellent floating dock, in which there are at present several large vessels, a French war steamer, and two large yachts, one from England, the other from Russia, and it is only to be wondered that more yachts do not put into Deauville, where they can lie so snugly and securely.

The hippodrome, or race course, of Deauville is a mile and a-half in circumference, and is second to none in the empire ; it belongs partly to the proprietary, and partly to the Jockey Club of Paris, the most influential of whose members take a deep interest in the Deauville race-course.

Besides numerous furnished houses, Deauville possesses two very large and handsome hotels—the Hotel de Terrasse, and the Hotel de Casino, at either of which, even at the fullest season of the year, the visitor will be boarded for ten francs a day, and boarded and lodged for about thirteen francs a day, or even less by agreement by the week. Altogether, I look on Deauville as second to no watering place in France, with the exception of Biarritz, and I have seen them all; and Deauville has the advantage over Biarritz that it is more easily reached from either England or Ireland, a steamer plying between Havre and Deauville twice each day in the summer season, and performing, at a very moderate charge, each journey in about thirty-five minutes.

Sir Joseph Olliffe generally comes to Deauville in the middle of July, and remains during the season, and although he does not seek practice here, I understand he does not refuse to prescribe for any patient who may absolutely require medical advice when he is at Deauville, which, of course, attracts many of his patients and numerous admirers to Deauville for the bathing season.

The weather here at present is very fine, and although the sun is hot, there is a controlling sea breeze, which, to one coming from the cold and damp climate of Ireland, is really a most desirable change.

Deauville is at present full of very distinguished people, attracted here by the races, which are at present going on, by a troup of actors from the Palais Royal Theatre, and by Adelina Patti, who is going to give a concert to-night. It is rumoured that Patti is so pleased with Deauville that she is thinking of purchasing a bathing residence here.

Deauville-Trouville, Calvados, August 5, 1867.

"A LETTER FROM A DISPENSARY PATIENT."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me to give the copy of a letter for insertion in your Journal, which I received from a dispensary patient :—

"If your onaur would be so kind to send me coddle ine oil I am very bad with sornis about my hart and a sprifin in the mornin I am carsley able to stand on my feet with coghing."

CHOLERA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—In your last issue, some inaccuracies appear in the report of the late cholera discussion before the British Medical Association, which you will kindly permit me to correct.

There was *no* difference of opinion upon the subject between my friend Dr. Mapother and myself. His paper was upon the "Topography of Cholera ;" mine was upon a very successful line of treatment adopted by me, and based upon my views as to the nature and pathology of the disease, published in your valuable journal, August 1, 1866.

I maintained that the disease was a contagion, probably communicated through the medium of air, water, or food ; that its development and diffusion depended upon certain atmospheric, hygienic, and individual conditions ; that the chief effects of this contagion were produced upon the sympathetic nerves, especially upon those presiding over the gastro-intestinal tract; that these nerves became powerless to discharge their functions while in contact with the morbid products of the disease ; and therefore the treatment indicated appears to be, to remove those injurious products, and give tone to those nerves.

With your permission, I shall shortly place before my Professional brethren, a summary of my paper, and the treatment which I pursued.—I beg to remain, dear sir, very truly,

P. C. LITTLE, F.R.C.S.I., &c.

SUDDEN DEATH OF DR. VICTOR BAZIRE.—On Wednesday last Dr. Lankester held an inquest at 28, Woburn-square, on the body of Dr. Victor Bazire, who expired very suddenly on Sunday morning. Death was foundto have been caused by the rupture of an aneurism. Deceased, who was only thirty-one years of age, has but briefly survived his talented master, Trousseau, the translation of whose work he was just finishing, enriched with many of his own annotations. His untimely end is greatly regretted by the medical profession generally, by whom he was looked upon as destined for a brilliant career.

Gleanings.

SCAVENGER ANIMALS.—The part played by certain mammals and birds in the removal of refuse, more especially in hot climates. is far more important than generally supposed. As regards India and the East, the chief actors in this great sanitary movement. or what might justly be designated Nature's first-class scavengers, embrace, among beasts, the jackal, hyena. domestic swine. dog ; and among birds, vultures. kites crowns, minas. and the well-known adjutant (*Leptoptilos argala*—Gmel.) I have noted many facts in connection with the habits of these useful animals in South-Eastern Europe North Africa, as well as Asia, and been strongly impressed with the belief that if the time should some when the most prominent actors in the scene became extinct. or greatly reduced in numbers, there will needs be some means of making good the loss ; for, most assuredly. if Eastern cities were at present denuded of their carrion quadrupeds and birds, there is no system of conservancy on the part of the human occupants at all equal to take their place. The nocturnal. bold. and sneaking habits of the jackal and hyena are well-known. The last is decidedly far less numerous, and hunts generally singly, whilst the jackal does so in packs. The one appears, however, frequently to accompany the other, for at night, among the discordant yelps of the jackal, may be heard the hoarser barks of the striped hyena. Over South-Eastern Europe, Central and Southern Asia, both are more or less plentiful, affecting also the mountainous regions to pretty high altitudes. It is said that the pariah dog assists them to rifle graveyards ; at all events, it is no uncommon circumstance to see the results of their depredations. One frightful example came under my notice at Rawul Pindee, where a grave in the cemetery was opened and a body torn to pieces by a troop of jackals. On the occasion in question they had removed several heavy stones placed above the body in order to prevent their attacks, and I noticed that, besides using their fore-paws in removing the soil, they had evidently lifted many of the stones with their mouths. Withal, however, these sacrilegious deeds are more than compensated for by the vast amount of scavenger work they accomplish. Although anything in the way of flesh, putrid or otherwise, is acceptable, I am not aware that the jackal betakes to the dung-eating habits of the dog, swine, and even sheep of India. The two first play an important part in the removal of the excreta in and around many Oriental cities, where no such institution as either a public or private latrine is known. Indeed, the swine of many parts of India are maintained entirely in this way, and driven daily to the purlieus of the towns. The domestic animal strongly resembles the wild species in its outward form, but its lean appearance and excessively loathsome habits, present an equally opposite contrast. Its flesh is very often "measled," that is, contains the germs of the tape-worm, which are supposed to be the result of its foul feeding. This circumstance came forcibly before my notice at Rawul Pindee, where the diseased flesh of the animal was sold in quantities to the soldiers. . . . No doubt, mutton is frequently contaminated in this manner, as, strange to say, the sheep, and even goats, of many parts of the East, take to the same abominable mode of feeding.—*Wanderings of a Naturalist in India, the Himalayas, and Cashmere. By A. L. Adams, M.D.*

TWO CHILDREN ATTACKED BY A MAD DOG.—An inquest was held on Saturday in Bethnal-green, on Edward Davies, a child of four and a half years old. On the 4th of last month the deceased and his brother were playing in the Old Ford-road, when they were attacked by a large dog, which flew at them and frightened them very much. The brother of the deceased was bitten. The dog was mad, and both children were taken ill. The other boy was in a hopeless state of hydrophobia, but the deceased had died, according to the evidence of the surgeon, from an effusion of serum on the brain brought on by fright. Verdict accordingly.—*Standard.*

THE EXPLOSION OF PETROLEUM OIL.—Among the persons seriously injured by the explosion at Bordeaux, the owner of the lamp establishment appears to be the greatest sufferer. His wrists are almost carbonised, and he has many serious contusions occasioned by his having jumped in his fright from the second floor staircase. The firemen were very fortunate in breaking his fall. Madame Huard is also injured. All the wounded were conveyed as promptly as possible to the hospital of St. André and to the military hospital, the former receiving as many as thirty-two patients, several of whom lie in a highly critical state. The Emperor Napoleon, when informed of the fire, immediately forwarded £200 for distribution among the sufferers —*The Standard.*

THE EX-EMPRESS OF MEXICO.—From the time of her retirement to Miramar the fate of this unfortunate princess has occasioned lively sympathy in all directions. As soon as the death of Maximilian was confirmed, preparations were made for her removal to Belgium, as we have already reported, and the journey was accomplished without difficulty. The *Mémorial Diplomatique* stated at the time that, "Notwithstanding the rapidity with which the journey from Miramar to Brussels was made, it occupied only two days, the health of her Majesty in no wise suffered from it. Indeed, we received from the Belgian capital the consolatory information that a slight inprovement has taken place in her mental condition in consequence of quitting her state of isolation." The *Indépendance* of Brussels added, "We learn that the Empress Charlotte has passed a good night, and is as well as is possible. Her Hajesty appears pleased to find herself once more at home and in the midst of her family. She drove out yesterday afternoon with the Queen round the park of Tervueren in a pony chaise." These statements were received with lively satisfaction, although many sinister rumours continued to prevail, rumours that, during the past week, have been put into shape in the following remarkable paragraph of the *Pall-Mall Gazette*:—"Since the Empress Charlotte has been transferred from Miramar to Brussels, the two medical men who up to that time had been attached to her person, and charged with the treatment of her case, have been replaced by a Belgian physician celebrated for the cures he has effected of persons regarded as hopelessly insane, and it is not impossible that in the case of the distinguished patient confided to his care new remedies may triumph over that mysterious illness which, after having destroyed the Empress Charlotte's reason, still menaces the remainder of her days. A writer in the *Figaro*, M. d'Auvergne, considers the present the proper moment for making known the opinions of well-informed Mexicans on the subject of the Empresse's illness, which may be said, by depriving Maxmilian of his ablest counsellor, to have precipitated the fate of the unfortunate Prince. M. d'Auvergne says (we quote him without assuming any responsibility for his statements):—'I have under my eyes several letters of different dates, written by persons in whose veracity I have the most entire confidence, by reason of their position and long experience in Mexico.' Here are a few passages from this correspondence:—'Do not doubt for one instant that this madness is the result of a crime, the contemplated commission of which was known beforehand. The two enclosed extracts from South American newspapers which speak of the Empress having been seized with attacks of insanity on board the packet-boat when nothing of the kind had happened, will be a revelation for you. Even if symptoms of insanity had at this time manifested themselves, the circumstance could not have been known on this Continent when the Empress was still at sea.' Another letter says:—'Her Majesty was warned by a notice found in her dressing-case at Vera Cruz that her life was menaced by the hand of a so-called friend. She, nevertheless, embarked without showing the slightest outward sign of mistrust. She, however, avoided being alone with at least one member of her suite throughout the voyage. She took nothing beyond the ordinary repasts served on board the ship, and one day even refused a cup of chocolate which had been specially prepared for her. It is certain that she mistrusted the persons around her, either from some instinct of her own or by reason of the caution she had received, and which some time later she unfortunately neglected.' 'The poisoning,' says another letter, 'was accomplished during the Empress's voyage to Rome. There is no trace of any previous attempt having been made, and if one had been made it must have proved abortive. A second dose was, no doubt, given the night before, or the morning of the audience at the Vatican. A few grains more and death would have been inevitable. I find in the statement published in the European newspapers all the symptoms of the Vaudoux.'"

A LETHARGY.—A man is now lying in the St. Jean Hospital. Turin, in a complete state of lethargy. He is quite insensible to pricks from needles, and the soles of his feet are also without feeling Some shocks of electricity have alone produced an effect on him. He is twenty-four years of age, and for the last forty-seven days has lived on milk passed through his nose into the œsophagus.—*Standard.*

Medical News.

ARMY MEDICAL DEPARTMENT, *August 9th*, 1867.—The Director-General presents his compliments to the Editor of the MEDICAL PRESS AND CIRCULAR and begs to enclose a list of the candidates of Her Majesty's British service, who were successful at the Competitive Examination in February last, and who have passed through a course at the Army Medical School, showing the combined results of the examination.

Name.	Studied at.	No. of Marks.
Bredon, R. E.	Dublin,	5570.
O'Reilly, T.	Dublin,	4753.
Fairland, E.	London,	4620.

UNIVERSITY OF LONDON.—The following are lists of candidates who passed the respective examinations indicated :—

ANATOMY.

First Class.—Richard Lawton Roberts (Exhibition and Gold Medal), University College; William Richard Gowers (Gold Medal), University College.

Second Class.—Edwin Rayner, B.A., University College.

ORGANIC CHEMISTRY AND MATERIA MEDICA AND PHARMACEUTICAL CHEMISTRY.

First Class.—John Davies Thomas (Exhibition and Gold Medal), University College; Richard Lawton Roberts (Gold Medal), University College.

MATHEMATICS AND MECHANICAL PHILOSOPHY.

First Class.—John Hopkinson (obtained number of marks qualifying for Exhibition), Owens.

CHEMISTRY AND NATURAL PHILOSOPHY.

First Class.—John Hopkinson (Exhibition), Owens; Arthur Robinson, Owens.

Second Class.—William Thorp, Royal School of Mines; James Bottomley, B.A., Owens.

Third Class.—James Barry Ball, University.

BIOLOGY.

First Class.—Arthur Robinson, Owens.

Second Class.—Francis James Carey, M.A., Guy's Hospital.

Third Class.—James Bottomley, B.A., Owens.

CHEMISTRY AND NATURAL PHILOSOPHY.

First Class.—Arthur Richard Saunders, University College.

Third Class.—Edward Bibbins Aveling, private study; James Barry Ball, University College Hospital; William Williams, Guy's Hospital; Joseph Theodore Ingoldby, Guy's Hospital; William Whitchurch Taunton, University College; Thomas Jones, Guy's Hospital.

BIOLOGY.

First Class.—John Mitchell Bruce, University of Aberdeen.

Third Class.—Edward Bibbins Aveling, private study.

WE understand that Dr. Jameson has retired from his position of surgeon to Mercer's Hospital in consequence of his increasing midwifery practice. Dr. John Morgan has been appointed to the vacancy made by Dr. Jameson's resignation.

CATTLE PLAGUE INQUIRY.—The last official return states that for the week ending the 3d August no cases of cattle plague were reported from any part of Great Britain. The total number of cattle reported to have been attacked in Great Britain since the commencement of the plague is 278,740, and 56,947 healthy cattle have been slaughtered to prevent the spread of the disease.

THE INTERNATIONAL MEDICAL CONGRESS.—The French journals state that about 600 names have been given in, 350 of these being those of foreigners, and that there is no doubt the numbers will rapidly increase. As to the memoirs, papers, &c., they have arrived in such excessive abundance that the first duty of the committees will be the delicate one of determining which of the innocents shall be massacred.

THE New Vaccination Act received the Royal assent on Monday, and was issued on Wednesday. It comes into operation on the 1st of January next.

NOTICES TO CORRESPONDENTS.

Contributions should be *legibly* written, and only on one side of the paper.

When proofs are forwarded it is of the utmost importance that they should be corrected and returned without delay.

Every MS. should bear the Name and Address of the Sender.

Dr. McGrigor Croft.—Your letter shall appear in our next.

A Subscriber.—1. Watson's Practice. 2. Mapother's Physiology. 3. Churchill's Midwifery. Both books are over diffuse.

Inquirer, Scarboro.—No person except an indentured apprentice, or a certificated assistant is legally entitled to dispense. This rule is not, however, always enforced.

Student.—1. The book you mention is published by Messrs. Churchill and Sons. 2. You will find all the information required in our Students' Number, September 19, 1866. For the new bye-laws and regulations see Students' Number for 1867, which we hope to publish early in September.

Dr. B.—Your request shall be attended to, and any facts we can collect, likely to assist your investigations, forwarded.

H. T. T. Portland is thanked for his kind wishes, which are most gratifying.

Births, Marriages, and Deaths.

BIRTHS.

DODGSON.—On the 7th inst., at Cockermouth, the wife of Henry Dodgson, M.D., of a daughter.

EAMES.—On the 5th inst., at the Asylum, Letterkenny, the wife of James Alexander Eames, M.D., F.R.C.S.I., Resident Medical Superintendent, of a son.

REID.—On the 7th inst., at Pembroke, the wife of Douglas A. Reid, M.D., of a son.

MURRAY.—On the 9th inst., at Green-street, Grosvenor-square, the wife of G. C. P. Murray, M.D., of a son.

GREENWOOD.—On the the 10th inst., at Penryn, the wife of N. Greenwood, L.R.C.P.L., of a son.

MARRIAGES.

LAWRENCE—SNEAD.—On the 8th inst., at Llangynidr Church (after banns), Arthur Garnons Lawrence, M.D., of the Cedars, Chepstow, third son of the Late Henry Lawrence, Esq., J.P. for the Counties of Carmarthen and Pembroke, to Edmundtina, elder daughter of the late Jas. Prosser Snead, Esq., of Pwll Court, J.P. and D.L. for the County of Brecknock, and Granddaughter of the late Colonel Gwynne, of Glanbrane-park, Camarthenshire.

JEAFFRESON—CAVELL.—On the 9th inst., George E. Jeaffreson, M.R.C.S., of Framlingham, to Helen Anne, second daughter of the late Edward Cavell, Esq., of Bawdsey Hall, Suffolk.

BARTLEET—BERRY.—On the 13th inst., T. H. Barleet, M.B., of Colmorow, Birmingham, to Louisa Ann, only daughter of Samuel Berry, Esq., of Edgbaston.

ROBERTSON—JONES.—On the 7th inst., at Moreton Pinkney, Northants, by the Rev. W. T. Browning, M.A., assisted by the Rev. Gordon Robinson, B.A., brother of the bridegroom, the Rev. W. H. Robertson, M.A., Minor Canon in Durham Cathedral, elder son of W. H. Robertson, Esq., M.D., J. P., of Buxton, to Frances Henrietta, younger daughter of the Rev. Francis Jones, M.A., Incumbent of Moreton Pinkney.

DEATHS.

MACINTIRE.—At Peshawur, of cholera, Deputy Inspector-General Macintire, Indian Medical Service.

MEYMOTT.—On the 24th of June, at Sydney, New South Wales, Chas Meymott, Surgeon, formerly Surgeon to the Horsemonger-lane Gaol, and to the South London Dispensary, aged 54.

NEWNHAM.—On the 3rd inst., Lewis Newnham, M.D., of Camberwell-road, aged 40.

LORIMER.—On the 5th inst., Robert Lorimer, M.D., of Tyne-park, Haddington.

RANSOME.—On the 6th inst., at Flixton, Lancashire, J. A. Ransome, F.R.C.S.E., of St. Peter-square, Manchester, aged 62.

HEPWORTH.—On the 6th inst., J. D. Hepworth, B.A., L.S.A.L., of Pudsey, Leeds, aged 69.

TRAINED NURSES (Medical, Surgical, Mental, and Monthly), can at all times be obtained from this Institute.

Hospital Appointments by special arrangement.

Letters and Telegrams should convey the nature of the case to be attended.

Apply to the Manager or Matron. T. HAMILTON, Manager.

WOODHALL Spa and Hotel, near Horncastle, Lincolnshire.—This well-known Mineral Spa, which has been for many years highly recommended by the Faculty for the cure of Strumous Complaints, Tumours of various kinds, Rheumatism, Gout, Epilepsy, and Specific Constitutional Diseases, especially those of the Skin, is now in first-rate order. The Hotel replete with every comfort, and the charges moderate. Hot, cold, shower, and hip-baths always ready. This Spa contains more Bromine and Iodine than any known water; and its curative powers are unsurpassed.

The Woodhall Spa Station of the Great Northern Railway closely adjoins the beautiful grounds of the Hotel. The water will be supplied bottled, or in jars, on application to the Bath-man.

CHOLERA THEORIES AND THE TREATMENT FOUNDED THEREON.

IV.

THE terrible epidemic of diarrhœa and cholera which last year visited London, ought to have taught us some important lessons; we fear, however, that all it has done in this respect is to enforce the truth of those conclusions, to which our experience of the epidemics of 1832, '49 and '54, had led us, viz., that the chances of safety in presence of the epidemic influence are proportionate to the thoroughness with which the conditions known to conduce to general health are established, and especially in proportion to the purity of the air breathed and of the water drunk. In the direction of preventive measures only, has a single step in advance been taken by the combined effort of the Medical Department of the Privy Council, and the great body of the London physicians; in the direction of successful treatment the great experience of the pestilence last year in London has not enabled them to make even a single step: on all sides there is the same confession of ignorance and helplessness, so appallingly impressive in previous epidemics; the same repetition of the same methods, the same futile experiments, and the same fatal results. Perhaps we are wrong in saying so absolutely, that no advance has been made, for indeed it is something to become clearly conscious of our ignorance, and something more to make public confession of it: it is true the number of those who have achieved this something, and who plainly and practically admit that drugs are useless —and worse than useless—as remedies for choleraic collapse is small; but it is an increasing number, and in its increase we think we descry the dawn of endeavours after modes of treatment, which, whatever may be their shortcomings, will at least have the sanction of science and common sense. There can, we apprehend, be little doubt, but that in a vast multitude of cases the fatal issue has been hastened by "treatment": calomel, opium, strychnine, sulphuric acid, and castor oil, as well as injections into the veins, are chief among the countless number of agents, the powers of which, if we have read the literature of cholera rightly, have been sorely abused. It is therefore something, as we have said, to testify as follows:— "The clinical history of the present epidemic, also shows that medicine is still as helpless (I use the word advisedly) as it ever has been in controlling the course, and reducing the fatality of the fully developed disease. . . Medicine has not yet discovered the means of rescuing an individual from the advanced stages of cholera."[1] Referring to cholera in Malta during 1864, it is stated in the Sanitary Report of the Army Medical Department, that "the Pharmacopœia and medicine stores are well foraged, but to no good end," and that "the experience of the epidemic tends to the inference, that no known system of treatment hitherto adopted has but the slightest pretensions towards cure."[2] These conclusions have obtained practical expression at University College, London, where during the recent epidemic most of the cholera patients were treated without drugs, and where, after various plans had been tried, the no-drug treatment was the one most in favour.[3] The Royal College of Physicians, not only implicitly abandons the use of drugs, but declares itself helpless: the Lords of Her Majesty's Privy Council consulted the College respecting the issue of instructions to Captains of Merchant Vessels, "how they should act when proper medical attendance cannot be procured, so as to provide for the health of their crews against attacks of cholera." The reply of the College (dated July 4, 1866) consists mainly in the recommendation of hygienic and precautionary measures, their directions for the treatment of cholera itself being contained within five lines, which are as follows:—"The patient should be strictly kept in the recumbent position, he should be allowed to drink water freely, and should be abundantly supplied with fresh air. Warm applications should be used to the feet and legs, and a mustard poultice should be applied to the pit of the stomach. Cramps may be treated by rubbing the affected parts with the warm hand." Here is the sum total of advice which the collective wisdom of a Select Committee of the Royal College of Physicians in 1866 can offer the Lords of Her Majesty's Privy Council concerning the treatment of cholera! But surely even this advice is better than the prescription of medicines which experience proves to be useless, not seldom injurious, and generally more or less distressing to the patient.

The authoritative advice given by the College receives implicitly a general sanction from Dr. Macpherson, whose large official experience of "Cholera in its Home" imparts great weight to his opinion. His work,[1] published this year, espouses no theory, and, therefore, the statements it contains are the more likely to be impartial and reliable. It is, indeed, an invaluable compendium of facts and opinions, and is admirably adapted to cool the ardour of young enthusiasts, and to enable new theorists to test the value of their doctrines by the light of extensive experience ripened into wisdom. The main object of his pages, the author says, is "to show what medicine can, and what it cannot, effect in cholera; and their end will have been answered if they tend in any degree to check the unreasoning adoption of every possible remedy (most of them being in reality old ones resuscitated) which was displayed when cholera lately threatened us, and which, it is to be feared, will again manifest itself should cholera visit us."[2] Having recounted the failures of one remedy after another, he quotes the following melancholy testimony of Bouchardat: "I was on the mournful field of battle where I saw a crowd of victims fall around me, without, however, seeing the origination of, I will not say an efficacious remedy, but even one single discovery, or scientific and progressive thought."[3]

Thus it appears that according to the confessions of both the civil and military medical authorities, the instructions of the Royal College of Physicians, the declaration of the most authoritative writers and the most recent practice in London, that no further approach to a discovery for a cure of cholera has been made in 1866 than was made when England was surprised by the great epidemic of 1832, and that the whole result of the experience of the recent pestilence in the metropolis, which has destroyed 8000 persons, and occasioned the expenditure of £70,000, is a mere repetition of the lesson already learnt—viz., lessen the spread of the disease by establishing the best possible conditions of general health. Such are the results of empiricism working in the dark, and of the application of theories, the worthlessness of which experience has but decisively attested. One thing, however, is clear: so long as physicians know nothing of the real nature of the disease, so long are they likely to remain powerless to remedy it. It is true that valuable remedies have been stumbled on by accident, but it is none the less true that the healing art can make secure, and orderly progress only in proportion as its methods are dictated by knowledge of the essential nature of disease. Therefore, until the mystery of cholera is penetrated and dispelled we cannot hope to cope with it successfully. In other words, until we know both its remote and proximate causes we shall remain alike ignorant

1 Cholera in its Home. With a Sketch of the Pathology and Treatment of the Disease. By John Macpherson, M.D., late Deputy-Inspector General of Hospitals H.M. Bengal Army, and formerly of the European General Hospital, Calcutta, &c. London: John Churchill and Sons.
2 This was written in April last.
3 *Annuaire de Thérapeutique* for 1850.

how to treat it, and how to prevent it. If so, the men of theories—men having "crotchets"—though generally regarded as dangerous, are precisely the men most likely to point out the way of deliverance from the fatal demon still hovering about us. We, therefore, resume our notices of some of the theories which have been lately propounded.

Dr. Shrimpton, an English physician practising in Paris, has just published an elaborate work[1] in which he says he was led "long since to think that the nervous system of organic life might be the seat of this terrible disease," and that he believes he can now "trace the influence of cholera even beyond the last ramifications of the nervous system, and of the circulation, *to the elementary cells of the whole economy*" (pp. 57-8). "The nature of the disease appears to consist in an altered state of vitality of these cells which are undoubtedly affected in cholera," (p. 58). "Without doubt," he says, "our celebrated micrographs will find these cells altered in their structure, as they have already found the globules of the blood shrivelled up in cholera," (p. 59). As he tenders no evidence in support of his doctrine, but merely alleges that it explains "all the phenomena of cholera," among which he includes "the suspension of all the secretions," we shall not attempt to discuss it. We must observe, however, that all the secretions are not suspended, and that on the contrary both sweat and mucus are secreted in enormous abundance; and we are somewhat astonished to find that Dr. Shrimpton, whose opportunities of studying the phenomena of cholera have been great, should not only have fallen into the common error of asserting that all the secretions are suspended, but should allege that the abundant flakes of mucus forming part of the rice-water discharges are "coagulated albumen;" and that the temperature of "the expired air of cholera patients," and, indeed, the temperature of their bodies "is four or five degrees below that of the surrounding temperature" (p. 16). Why, even the temperature of a corpse is not below that of the surrounding air, and if Dr. Shrimpton will refer to the above mentioned report of the Army Medical Department (p. 341) he will find, as the result of careful thermometric investigations respecting the heat of the breath and of the body, that "the average fall from normal temperature [97°] into collapse was 11°", so that the average temperature of patients in collapse, deduced from measurements of the heat of the breath, and of the surface of the body, was found to be 86°.

(To be continued.)

SUGGESTIONS ON THE IMPROVEMENT OF THE PROFESSION.

By ISAAC ASHE, M.B.

(Abstract of Paper read before the Meeting of the British Medical Association, held in Dublin, August, 1867.)

Dr. Isaac Ashe presented a paper to the Association, on the general interests of the profession, and the improvement of its status.

He considered that the under-estimate of professional services at present exhibited by the army and navy authorities, the boards of guardians throughout the country, as well as clubs, and very frequently private patients, was due to the overstocking of the profession by an inferior class of practitioners, who entered into competition on low terms against men of better position and education, who constituted the majority of practitioners. The public were not competent to decide who were well-qualified and well-educated practitioners, and who were not. They could not estimate the different values of the M.D. of London and the M.D. of Lambeth. Yet, until men of inferior general and professional education were excluded from the profession, it would be in vain to seek from the public or the Government authorities a just recognition of its services, for these men were always ready to give their services for whatever terms might be offered.

The public were thus injured as much as the profession, and the benefits they would receive from the exclusion of the lower class of practitioners from the profession, would more than compensate them for the advantages which the profession would receive at their expense.

How were these men to be excluded for the future? They found entrance in consequence of the rivalry of the different licensing bodies in the struggle for fees. Nor was it of any use for certain corporations to attempt to maintain a high standard at present, for candidates whom they rejected, or who were afraid of their examinations, could easily find entrance elsewhere. Some parties in the profession had felt the evils of this state of things so strongly that they had even proposed that there should be but one examining and licensing body in the entire kingdom, but he would wish to see the different corporations maintained uninjured, and thought that if the competition for fees could be removed, the rivalry that would remain, namely, that for the high character of the diploma of each, would be beneficial both to the profession and the public.

He proposed that this should be accomplished by the General Medical Council receiving the fees of all candidates for a licence to practice a branch of the profession for which they did not already possess such a licence, fellowships, or other additional licences in any branch remaining as at present. The Council should give a circular receipt to each candidate, stating the sum he had paid, and each body to which it was presented should endorse this with a statement as to whether the candidate had been passed or rejected by them, and in the former case how much of the fees paid had thus been utilised. Marking the fact of a candidate's rejection would necessitate his return to the same body for re-examination. Out of the fees so received the Council should pay to each licensing body a fixed annual sum, irrespective of the number of candidates passed or examined, and to ensure the colleges against loss, this sum might be taken at the annual average of the fees received for such first licences by each during the ten years now last past. The number of students was rather diminishing of late years, and would probably continue to diminish, as the tendency of regulations was to become stricter, hence such a proposal as this was rather to the advantage of the Colleges than otherwise. No doubt as students diminished in number, the fees charged by the General Council would have to be raised, but the additional charge might be regarded by the candidate as an insurance paid against unfair competition in his profession afterwards, and this being removed, he would find his emoluments increase in proportion, for the consumer,—*i.e*, in this case the public, pays for all, and would in the present case find that he received a proportionate advantage.

It might be said that foreign diplomas would then flood the market. He proposed that foreign diplomas should be recognised only when presented by *bonâ fide* foreigners; this was all that international courtesy could fairly ask, and would be a compromise between the General Council and the Government. The competition of foreigners could never assume very formidable proportions. No foreign state could expect that Englishmen should be allowed to practise in England, if they had shirked the strictness of an English examination.

Quackery was a difficult subject; individual liberty must be protected; but he thought the practice of quacks contained within itself a hint as to the true remedy. They all, or 99 per cent., derived their gains from the sale of their nostrums. Nobody thought it a restraint on individual liberty to prohibit the sale of ardent spirits except under licence. Let the same method be adopted with regard to the sale of drugs, not poisons merely, as provided by the recent Pharmacy Act. Let a licence from the Quarter Sessions bench of magistrates, on the recommendation of two neighbouring medical practitioners, be necessary to legalise the sale of medicines, or preparations professing to be medicinal, by any person not on the Medical Register

1 Cholera; its Seat, Nature, and Treatment. London: John Churchill and Sons.

or the Pharmaceutical Register; such an enactment would be as beneficial to the genuine druggist, and to the public, as it would be to the profession. The quack practitioner could then write prescriptions for any person whom he could induce to take them.

General education was the instrument which would be most important for the future elevation of the profession. Preliminary examinations were for the most part a mere farce at present. A dozen pages of Greek and twenty of Latin, a sum in arithmetic, and a proposition in Euclid, that was the education of a gentleman and a member of a learned profession; if they could not do so much well the examiner could let them off easy. Nearly all the corporations would accept the certificate of any other licensing body, so the minimum came to be sufficient under all circumstances. Was it fair to the highly educated majority of practitioners that men of this stamp should be admitted into their ranks to compete with them? He would be glad to see the General Medical Council take preliminary examinations altogether into their own hands. What had the colleges to say to it? They were competent judges of a good professional education, but not necessarily of good general education, except in the case of the universities. The council might refuse to admit upon the Register of medical students any person whose general education had not satisfied them; he thought their powers went so far. If any college sought for higher education than the Council prescribed, and some certainly would, they might still demand it; but none could then accept less. The Council should have their own examiners in general education, and pay them fixed salaries.

He thought the preliminary examination ought to be such as would test a man's fitness for the special pursuit of medicine, and such as would require an education specially framed to develop the qualities needed for that pursuit, and extending through a course of years, and not through a three months' grind merely. These qualities were—

Habits of patient thorough investigation.

Habits of minutely accurate observation.

The power of reasoning correctly from effects to causes—*i.e.*, from signs and symptoms to diseases.

The classics were the best study for developing the first of these. Not some particular author merely, but an extended course of reading; the knowledge of the language being tested by giving the candidate some passage which he should be unlikely to have specially prepared.

English spelling, geography by the map, and field botany, would be perhaps the best studies for developing the second. English composition, a branch of study at present almost wholly neglected, was of the utmost importance as conferring the power of clear, consecutive, accurate thinking, and of correct expression.

The physical sciences would be the best study for developing the third, their very object being to trace effects to causes. The mathematical sciences would be a necessary preparation for these.

He was greatly dissatisfied with the ultra-classical education at present afforded by the public schools; so indeed was nearly everybody except the teachers; but their deficiencies were most glaring where medicine was to be the boy's future study. A university education was, of course, highly to be desired, and would pay afterwards in most cases, but it required more time and money than could usually be spared by young men intending to study medicine.

He proposed that the profession should institute a great public school for lads who are to be brought up to the medical profession; and that the whole course of study should be co-ordinated to the one great end of developing the talents and qualities of mind which would be most valuable to the future medical man.

The bearing of different studies on such an end could only be appreciated by a physician. A clerical educator of physicians would be the *ne plus ultra* of absurdity. He suggested a course somewhat of the following description:—

First year.—English spelling, geography from map, study of English words; English composition; Latin words.

Second year.—Latin authors; arithmetic, geometry; Greek words.

Third year.—Greek authors; algebra, trigonometry.

Fourth year.—Applied mathematics, viz., mechanics, hydrostatics, optics; astronomy; the French language.

Fifth year.—Zoology, botany, meteorology, physical geography; the German language.

Sixth year.—Geology, chemical physics, chemistry.

A boy might enter the school at twelve and leave at eighteen, in time to pass his professional examination at twenty-two, which was too young rather than otherwise for such a profession as medicine. These six years would be much better spent as above proposed than in apprenticeship, even if a general practice was what was proposed for after life. A young man would gain more practical knowledge in one year as a qualified assistant, having first studied theory carefully, than in five years of apprenticeship before such study.

Such a school education as above proposed would no doubt be expensive, but if 100 gentlemen were to undertake to send their sons, he thought it might be accomplished for from £60 to £70 a-year. He suggested the formation of a company of professional men, with 2500 shares of £10, £1 to be paid up to try an experiment in a rented building, and the remainder to be reserved for a building fund, should such experiment prove successful.

ON THE TREATMENT OF EPILEPSY BY ARTEMISIA VULGARIS AND CARDAMINE PRATENSIS.

By P. O'ROURKE, M.D.,
MEDICAL OFFICER ENNISCORTHY WORKHOUSE.

THE importance of affording relief to that most afflicted class of the community, epileptics, induces me further to report on their treatment in continuance of that which you published in the MEDICAL PRESS AND CIRCULAR of the 17th January, 1866.

At that time Thomas Whitty, Mary Toole, Bridget Doyle, James Duffield, Sarah Sheridan, and Mary Magee, were using the "artemisia preparation," and Betty Mernagh the "cardamine pratensis."

Toole, Doyle, Sheridan, and Magee, have left the house in good health, neither having had any recurrence of the epileptic seizures for a long time before leaving. It was impossible to get Whitty under regular treatment, as he left the house frequently on the slightest interference with his habitual ill temper. Duffield has been partially benefited; his attacks, which are now slight, occur but rarely.

The new cases admitted since my last report are:—

No. 23. Mary Swayne, aged 28, admitted on the 24th March, 1866, very delicate, intelligent, good-tempered, not easily excited, and very amenable; fits very severe, and frequent; illness supposed to be hereditary, as her mother was a confirmed epileptic for many years, and is the next case.

24. Mary Swayne, aged 77, admitted into the epileptic wards with her daughter, the last case; a very small person, emaciated, weak-minded, voice indistinct, owing to partial paralysis scarcely able to walk, badly clad and filthy. After being properly cleaned and cared for, both were put under treatment, and the most marked improvement as to habits and disease had taken place in each, but nothing would induce them to remain. They took their discharge to return to their confirmed habits of begging.

25. Ellen Kelly, a farm-servant, aged 20 years, admitted into the Infirmary on the 23rd of October, 1866, being deeply and severely burned over the face, ears, and scalp, from having fallen into the fire during an epileptic attack. She was healthy and robust, otherwise not imbecile. She was treated for those extensive burns by having the whole surface covered over with prepared cotton, soaked in liniment of lime, to which some oil of turpentine and chloroform were added. These were kept on without

removal for a considerable time until the parts began to heal. About three weeks after admission, she had so severe and violent a fit that three persons were required to hold her. During the seizure the burned surfaces bled so profusely that the bed-clothes were saturated with blood. The sores gradually healed. The fits recurred in a week, when she had three within twenty-four hours, as violent and severe as before. She was removed to the idiot wards and put on the "artemisia preparation" as usual. The fits were less severe, and passed off without any assistance. She had no return for five weeks before she left the house, as her mother would not leave her any longer. A near relative was similarly affected.

26. Catherine Finn, aged 16 years, admitted on the 4th March, 1867; stout, and very healthy; had for the first time an epileptic attack about four years back, and a second, about two years ago, while sitting at the fire, into which she fell. The fits then recurred three times a week for a year and a half; went to service about twelve months back, but had to leave on account of her illness. She was put under the usual treatment, and is improved very much, being now attacked once a month. Continues under treatment.

27. Anne Murphy, æt. 25 years, admitted on the 22d of April last, as a harmless idiot from the Wexford Goal where she was committed as a dangerous lunatic on the 14th of March, 1865. Soon after admission had an epileptic seizure, which was very severe and long continued, requiring two or three persons to hold her, the fit recurred the next day—she was incapable of doing or knowing anything, could not feed herself, and unconscious of any natural call; in fact she was perfectly idiotic and apparently dumb. On inquiring from the medical officer of the goal, it appeared "she was attacked with fits at night three or four times a fortnight, but only once during the day time whilst in gaol. It required two or three persons to attend to her and keep her clean. She had no feeling whether she would be dressed or go naked." I put her under the usual treatment, and she has had not a fit now more than two months. She is become intelligent, speaks freely to those around her, can feed herself, mend her clothes, and attend to the natural calls as carefully as possible. I learn she has been epileptic for many years, and imbecile. The cause is supposed to be a hereditary and immediate one, owing to the shock she got on account of her mother having committed suicide. This sad event had such an effect on her, that she strayed naked through the country, and was found on the railway by the police near Ferns, and subsequently committed as a dangerous lunatic to the Wexford Goal.

No. 28. Anne Connors, ætat. 24 years, admitted on the 5th of June last, of a strong and robust constitution, with partial epilepsy, was violently convulsed, and trembled not unlike severe palsy, during the seizure; she was not conscious, but could speak. For five weeks before admission the fits recurred every fifteen minutes, and lasted five or six, and were most distressing. She stated she was very ill before she was attacked with something like fever and hiccup, and was very bad for six weeks. When she got better and was relieved, the shaking and convulsions commenced. On admission, a large sinapism was applied to the nape of the neck, and between the shoulders; a colocynth and hyoscyamus pill every day; put her on the "artemisia beer" three times a day as usual, and after twenty-four hours she had no return of the attack, and discharged on the 10th of July from the idiot ward to the infirmary, for chronic ophthalmia and inflammation of the eye-lids.

There are only remaining under full artemisia treatment, taking the full quantity this date, Catherine Finn and Anne Murphy; James Duffield taking the preparation occasionally.

It has been suggested that a public medical library could be collected with great advantage out of the College library in Calcutta.

UNIQUE CASE OF SUPPOSED THORACIC ANEURISM.

By W. H. SANDHAM, M.R.C.S.L., Cork.

Mr. J—— L——, Cork, æt. 62, low in stature, stout, square-built, florid, fresh and healthy in appearance, jolly, courteous and kind in manner, and a general favourite, fourteen years ago was pronounced by a medical man of eminence to have heart disease of such a nature that his life was not worth an hour's purchase. This opinion was corroborated by two other medical men of ability to whom he was introduced by the first physician, and they, or one of them, directed, so imminent was his case considered, to have his journey to Cork divided, as it was probable he had not many hours to live.

These opinions, and the fact of Mr. L. having lived and enjoyed himself grouse shooting, yachting, &c., *for fourteen years after*, makes his case a very interesting one indeed, not only to the profession, but very much so to his friends, and all who knew him in Cork, and, therefore, I am induced—having been his medical attendant for the last month and three days of his life, and being present, his hand in mine, when his sufferings terminated—to give the history of the case.

Two years before his death, I attended Mr. L. for a very severe attack of sciatica, during which, to use his own words, "he suffered tortures"—which I cured by galvanism. Some time after this he was taken ill in a hotel in Liverpool at night. He became so frightened and agitated that he got out of bed, started for Cork, and never broke the journey till he called for me, and drove me to his house, there he expressed his fears that it was his heart was now at him.

He was suffering from pains and uneasiness under and around the left nipple. Pulse steady, tranquil, and 70—flatulent distension of stomach and colon. I *minutely* examined heart and lungs; both lungs were resonant all over on percussion, and the respiratory murmur distinct. The heart's systolic and diastolic sounds were distinct and normal. The only thing wrong I could discover in the vessels proceeding from the heart was a bruit, or slight bellows murmur, in the left carotid. Having found the lungs and heart in this condition, I then gave it *as my decided opinion* that *his heart was perfectly healthy*, and traced his evident dyspeptic attack to the eating of an overdone fresh beefsteak. He became composed and satisfied, as he before suffered in a similar way from a like cause. He was up and out next day, and quite rid of this attack in three or four days.

After this, up to the time of his last illness, which Mrs. L. assured me commenced the January before, every one was pleased to remark how well he looked—fat, rosy, fresh and jolly in appearance, and well able to superintend his vast business, being a director of a gas company, and manager of a bank. Whether it was wise of him to so strain his mental faculties, which were of a superior order, the sequel may demonstrate.

One month and three days before his death I was called in, and found him in his bedroom suffering from paroxysms of dyspnœa most distressing to witness; his skin was normal, but, from suffering, sometimes bathed in perspiration, his tongue perfectly clean, bowels regular, but very tympanitic; pulse steady, calm, full, and regular, 72 to 80, never more throughout his whole illness, or the most severe paroxysm. This I beg my readers particularly to note. In fact, this pulse was his pride (I may say) for he would often reach out his hand and request you to examine it when his sufferings were at the highest. He now also suffered from capillary bronchitis of the right side, and the gluey pellets of mucus gave great trouble. Up to this time he was *two months* suffering,—*had no sleep, and the horizontal position seemed intolerable.* Remark this. For ten days and nights previous he could not lie for one moment on his bed, and he would start off his chair twenty times in as many minutes. His most distressing symptoms at this time were this and dyspnœa. His former medical

adviser had him in charge for the past two months, and in consequence of, on our first consultation, my having differed with him in opinion, he brought in a third, with whom I also differed. They gave it as their opinion that all was caused by aneurism of the ascending aorta of considerable extent, so great as, in the opinion of the gentleman so long in attendance, to involve the descending aorta. I differed, stating that he had no heart disease, and if there was aneurism present it must be small in extent, and by no means sufficient to account *to me* for all the distressing symptoms present. Mr. L. and family now requested me to take charge of him myself, which I did, having first requested, owing to the onerous position they would place me in, that Dr. ——, would be my colleague. The first thing we did was to assure his family and friends of the hopelessness of his case, and that we took him in charge with a view to mitigate his sufferings and smooth the road to death.

The attacks described were remarkable for their periodicity, always aggravated after six or seven o'clock in the evening. We commenced treatment at nine o'clock P.M., and at two o'clock A.M. he was —remark this—*lying down in bed, and slept soundly till nine o'clock next morning.* Electricity and acetate of morphia, administered freely and frequently, got rid of this, although it was stated in consultation, by the gentleman last consulted, that opium, or its preparations would prove fatal in such a case, and I must say, Mr. L. and family had a strange idea that opium never agreed with him, but in opposition even to the prejudice I gave the morphia.

Next morning, Mr. L., having first thanked God for such a rest, in the presence of his wife and sister, thanked me in an especial manner, in language that it would appear egotism to repeat. After two or three nights he never suffered from the fearful dyspnœa. But now he was attacked with fearful abdominal suffering, which appeared to be spasm of the diaphragm and flatulent colic. Abdomen very tympanitic. This we also removed, and now came on regular hysterical attacks, commencing with deep sighs and sobs, and at its height, an utter inability to retain his urine. This annoyed him much, but after a day or two we removed this also, by the judicious administration of chloroform. It had a magical effect in fifteen minim doses, every two hours, till relieved, and his suffering became positively nil compared to his former state, but now—that is three weeks before death, *the kidneys ceased to act*, and his inferior extremities became anasarcous. All this time he used to lie down in bed, and never referred to the cardiac region or lungs as the seat of suffering, in fact, his case was remarkable in this particular.

No remarkable dyspnœa more than that caused by bronchitis of right lung, and at this time, on a few occasions, there were light tints of blood on the expectorated gluey mucus. Nothing like hæmoptysis or hæmorrhage ever appeared—mark this also. It is right to say that for the dropsy, my colleague, Dr. ——, for a few days tried homœopathy. Now he would betimes become semi-unconscious, and incoherent from uræmic poisoning. Still the pulse was steady, calm, and 72 to 78, to near the close, when it became feeble, thready, and 100 to 110, when he expired as follows :—On Monday morning's visit he was just after exerting himself to get from the close stool into bed. The moment I placed my finger on the pulse I saw how near his end was. I gave him half-a-glass of brandy in punch ; he rallied, and after a little his pulse became again normal, *without intermission or irregularity.* It was now twelve. At four o'clock I again called, and *found him lying perfectly flat without a second pillow.* No particular dyspnœa, and conscious when roused. Pulse going fast. This I announced to his wife, sister, and sister-in-law, then present. During their prayers, he himself stopped them, distinctly uttered an ejaculatory prayer, gave two deep, not convulsive inspirations, and died as if going to sleep. This is as faithful a history of the termination of this interesting case as I am capable of giving, without extending aught in malice.

REMARKS.

The learned profession, for whom I have sketched this case, may be able to say whether the opinion expressed fourteen years ago was correct, or whether that ventured on by me two years before death, seems nearer the truth. There was no evidence of hydrothorax, as he did not live long enough to have the dropsy reach the cavity. On several occasions before, and within the couple of hours that preceded death, he declared "he had neither pain or ache in the region of the heart or lungs." There were no symptoms, at the close, to indicate either the presence or the rupture of the aneurismal tumour, of the large extent on the presence of which those gentlemen insisted, with whom I was rash enough to differ ; but I close by putting the following questions :—

If aneurism, to the extent stated, was present, what would be, in fact, what are the constant symptoms present ?

While such an aneurism existed, would not most of the symptoms be permanent, persistent ?

If the fearful symptoms present, when I was called in, were caused by large or small aortic aneurism, why did they, under treatment, altogether disappear?

Is fearful abdominal suffering symptomatic of aortic aneurism within the thorax ?

Are great hysteria and involuntary micturation symptoms?

Is it (as Mr. L. died) persons afflicted with thoracic aneurism usually die, lying calm and flat on their beds ?

In my experience, certainly not. In such a case as my learned friends and I happened to differ on, and they described, I would expect it short, sudden, and decisive, or lingering and distressing beyond measure to witness. Mr. L.'s was surely a unique case, and one that I am satisfied was altogether caused by some lesion of the great sympathetic system ; but the immediate cause of death undoubtedly was renal dropsy. There was, I regret, no autopsy.

In fine, if there are any learned physicians who met with cases of thoracic aortic aneurism of fourteen years' standing, and the subjects suffering therefrom having throughout the whole period of its existence a steady, calm, full, normal, non-intermitting radial and caroted pulsation of 72 to 80, I must have some doubt of my opinion. But, up to now, I have considered the existence of such a circulation as proof against the presence of thoracic aneurism, almost of any size.

I have been assured by an old friend of Mr. L.'s that, three years after the opinion given fourteen years ago, he and Mr. L. presented themselves to Dr. ——, and when Mr. L. was then examined by him, his expression was, after Mr. L. had described how he then lived, "My dear Mr. L., you are a puzzle to me. I thought you were dead long since. All I can say is, I am delighted to see you looking so well. Go home, and live and enjoy yourself as you have described."

Such were the words of the very physician who three years before directed him to divide his journey to Cork. The gentleman referred to will recognise the case at once, and can test the truth of some of the statements made by me in detailing the history of the last moments of as worthy a fellow as Cork ever contained, and universally regretted. He died at twenty minutes to five o'clock P.M. on Monday, the 14th May, 1866.

REPORT ON WINE : ITS USES AND ADULTERATIONS.

[SPECIALLY PREPARED FOR THE MEDICAL PRESS AND CIRCULAR.]

No. I.

It has long been our intention to issue a Report founded upon a series of practical and experimental investigations, into the properties and uses of wine. This intention has been hitherto frustrated by various circumstances that have imposed delay. Some of those who have undertaken a portion of the investigation have not yet completed their work. Others are waiting to put their conclusions

into definite shape. Some have only as yet succeeded in accumulating material. This indeed with each of the Reporters grows apace, so that the difficulty of arrangement continually increases. Under these circumstances, taking our readers into our confidence, we propose to commence at once, instead of waiting till the mere artificial arrangements of a subject which bids fair never to be exhausted shall be completed. By disposing of some points in occasional papers, as we find them ready, we may perhaps really facilitate the object we have in view, and if by so doing we produce a Report, the parts of which may seem less harmonious than had it been revised as a whole, the defect will be less perceptible from its publication in a periodical; moreover it will enable us to be free from one part while arranging another, besides which it will afford, what on this subject has never yet been offered in any journal, opportunity for free discussion of the several points as they arise. We are aware of the many diverse opinions on the subject, and we desire that all should be fairly heard. Although, therefore, we do not intend to restrain those to whom we have entrusted the Report, either individually or collectively, in the expression of their views, our columns will be open to such replies as may be just and temperate.

The Report is intended to take a wide scope. Wine, in every form is the subject, and whatever relates to it will not be out of place. The chief question will of course always be the value of the various sorts of wines as beverages and as medicines. Incidentally this may include many other things, of which the most important are perhaps the mode of preparation, the countries producing, the comparative strength in alcohol, the relative richness in various constituents, the adulterations practised, and their detection, and the indications for prescribing or forbidding them. These and other interesting considerations will receive attention as we proceed, nor must we omit to say that the literature of the subject will not be entirely omitted, as we shall be obliged from time to time to refer to standard books, and not unfrequently to writings that have no claim to that appellation. We have spoken of wine as a beverage as well as a medicine. We do not feel called upon to defend the phrase—nor, for that matter, are we concerned on this occasion to argue for or against the custom of drinking it. From the earliest times the fruit of the vine has been resorted to in health as well as in sickness. The poetry and the history of mankind have given it a place in our life, from which it is not easy to imagine it removed. At the banquet of pleasure, at the scanty table of woe, it asserts its pre-eminence. Over learned and ignorant, rich and poor, young and old, it exercises its powerful sway. There is no event in human life with which it has not been intimately associated. So widespread is its use, that the German anacreontic lately circulated by our northern contemporary, in spite of its eminently national characteristics, reads almost like a legend universal enough to be founded on fact.[1]

No doubt there are persons to whom the broad admission we have made will be very shocking. They look upon the weakest wine as a most potent agent for mischief, and would persuade us that the grape was something more dangerous to us than the forbidden fruit was to our first parents. These persons are but a small minority, though confessedly an active one. We lately received, in common, no doubt, with many of our contemporaries, a lithographed letter, headed with the portentious question—"Is Alcohol food, physic, or poison?" The writer, Mr. Henry Pitman, seems fully convinced that it is a poison, and we do not for one moment doubt his sincerity, though we confess to some misgivings as to his logic.

Had he not made up his mind to the answer when he put the question he might have taken into consideration the possibility of some one answering without hesitation—"All three." This, however, he does not appear to see, for, with a simplicity which is quite charming from the unconscious manner in which he wields the *petitio principii*, he says:—"It is encouraging to find that the highest medical and chemical authorities now endorse the conclusions which have been clear to temperance men for nearly forty years, namely, that alcohol is neither food, force, nor physic, but a poison, like opium, and a substance abhorrent to the human economy; that it does not in the slightest degree nourish the body, or even prevent the waste of tissue, but that it arrests digestion, destroys the appetite, lessens muscular force and vital heat, excites the lower passions, predisposes the drinker to disease, and retards his recovery."

It is true that a number of quotations follow, and amongst them we find, very naturally, the sensation paragraphs of some of our contemporaries that have lately indulged their readers with descriptions of the "alarming" increase of "tippling by both sexes, young and old, in the middle and upper classes," that these writers have discovered and one of whom asserts that "everything in modern custom tends that way!"

But a truce to this digression. We need not enter into this question—much less express any opinions upon it in this place. Wine, as we have said, is in almost universal use. That is our justification for entering upon this inquiry, out of which, as it proceeds, we hope to furnish our readers with much useful information, and, perhaps, some amusement.

After so long an introduction, it would scarcely seem fitting to close this article without a more practical exemplification of our plan. We, therefore, leave generals for particulars, and pass at once to a sort of wine long held in favour in this country, though now, perhaps, losing ground with us. We allude to

PORT.

The mere mention of this, we are well aware, will recall at once the most opposite opinions. The enemies of port have lately grown very numerous, and its friends have lost their temper, or, instead of arguments in its favour, have only urged the songs it has inspired, or the myths to which it has lent countenance. It will, therefore, perhaps, be as well to take it first in order, and, considering the defection of its old friends to consider *in limine* the last utterance in its favour. This is to be found in a small blue book of "Commercial Reports, received at the Foreign Office from Her Majesty's Consuls," and presented to both Houses of Parliament last April. In this blue book will be found an elaborate defence of port wine, by Mr. Consul Crawford, who represents Her Majesty at Oporto. Mr. Crawford has collected and arranged in small compass a good deal of information, and his facts will everywhere be received with respect. The most striking part of his production is, however, his strong opinion, we had almost said prejudice, as to the superiority of port over other wines, and his advocacy of a system which has long been denounced as simple adulteration. Mr. Crawford considers it necessary to strengthen port wine with brandy, and he does not condemn the addition of even less tolerable articles. In an argument that was quite unnecessary, because the fact he wishes to prove is very generally admitted, and because also it is little to the point, he shows that *French* wines are very commonly strengthened by the addition of brandy. This, we need scarcely say, is no reply to those who assert

1 It tells that an angel, visiting the earth some time after] the subsidence of the Deluge, discovered Father Noah sitting at noon in the shadow of a fig-tree, looking very disconsolate. The angel inquired the cause of his grief. Noah replied that the noontime heats were oppressive, and that he was thirsty, and had nothing to drink. "Nothing to drink," said the angel. "Look around! Do not the rains fall, and the rivers run, and is there not a spring of water bubbling up at thy cottage door!" "It is atrue," answered Noah, smiting his breast, "that there is abundance of water in which thy servant can bathe; but, alas, when I think of the multitudes of strong men, of beautiful women, and of innocent children, and the countless hosts of animals that were drowned in the Flood, the idea of water becomes distasteful, and my lips refuse to drink." "There is reason in what thou sayest," replied the angel, and, spreading his snow-white wings, he flew up to heaven swift as a lightning-flash, and while the eyes of Noah were still dazzled by the brightness of his presence, returned with some stocks of the vine, which he taught the grateful patriarch how to plant and tend, and when the fruit was ripe how to press into wine. This, says the song, was the source of all the beneficent and benevolent drinks which the world owes to the grape.—*Blackwood's Magazine* for August.

that brandy injures *Portuguese* wine. Two wrongs can never make a right, and to prove that a practice is adopted by French wine growers, does not show that the practice is commendable, much less that it is right for others to imitate it. The admixture of spirit with port wine is not only countenanced, but advocated as necessary, by Mr. Crawford. He even makes the astounding assertion that the "clarety wines of Portugal require less brandy for their preservation than the richer wines of the Upper Douro," and he evidently thinks the more sugar a wine contains, the more it stands in need of super-added alcohol. We should almost rather adopt the contrary hypothesis. The clarety wines of which Mr. Crawford is speaking, are those that will not bear transportation, and must consequently "be drunk on the premises" where they are made, and they bear somewhat the same relation to the rich ports that "small beer" does to Bass's or Allsopp's best brew. In the vineyards of the continent we have drunk many varieties of this light wine, and we may remark that our experience, as might have been anticipated from theory, by no means accords with that of Her Majesty's Consul at Oporto. That weak sweet wines will keep a certain time, is familiar enough to the few British matrons who still pride themselves on their own "home-made cowslip," or on the excellence of their family recipes for raisin or orange wines. That sugar is, in some cases, an actual preservative, is not to be denied. Perhaps the light wines of which Mr. Crawford speaks, are scarcely accurately described by the epithet *clarety*. If so, we can only confess that our experience has given us different impressions than he has gathered from his. On the whole, without any prejudice on the matter, we cannot but feel he has not made out his case. We must return to the subject again —and this last defence of port by no means contains all that is to be said in its favour, yet it is in itself so important, that as the newest expression of this view, we have given it a foremost place, and lest we should be thought to have misunderstood it, we here add Mr. Crawford's own words. He says at pp. 109-110 :—

"It has been repeatedly asserted by the wine merchants here, British and Portuguese, that port wines contain so much more of those particles which go to constitute vinosity, that it requires more spirit to preserve them than lighter wines. The more thorough ripening of the grapes, caused partly by the admirable aspects of the vineyards in which they are grown; partly by the greater heat of the summer of Portugal; partly by the more complete pruning of the vines, and partly by the later gathering of the vintage, is such, that when placed in the press, each grape is (unlike the grapes used in French wine-making) one mass of saccharine matter. The juice of the grapes in this state forms a wine which, it is said, requires brandy in exact proportion to the fermentable and non-aqueous particles which it holds in suspension. It is certainly the case that the clarety wines of Portugal require less brandy for their preservation than the richer wines of the upper Douro. These wines are made for consumption within the twelvemonth. If required to be kept longer, they have added to them a certain percentage of spirit, while the Douro wines, even those meant for consumption in the country, require nearly twice that percentage.

"That the amount used is the true necessary minimum might easily be argued from the fact that the Portuguese prefer light port wines; and that the cost of brandy being ordinarily four times that of young wine, the obvious interest of the native merchant would induce him to employ the least possible quantity of the more costly liquid.

"The admixture of spirit with port wine is, at present, probably no more than is absolutely necessary. For many years past the demand in England has been for a port wine dryer in quality and lighter in colour; and the shippers here, to meet this demand, as well as to save themselves the expensive use of spirit, now more than ever endeavour to reduce their additions of brandy to a minimum. This reduction has, no doubt, been facilitated by the far more careful preparation of wine now adopted in the district of its production. There are, at present, upwards of 100,000 pipes of wine in stock in this city; and, after a series of very careful inquiries, my opinion is, that in the case of these stocks, 39 per cent. is about the average proportion of proof spirit to wine. Some few wines, mostly new, may contain as little as 36, and again a few richer ones 41, or even 42 and 43 degrees. It must be remembered that about 1 per cent. is added on shipment.

"A gentleman from Lisbon is at present employed in this city in investigating, on behalf of the Portuguese Government, the strength of the wine now held in stock. Although his report has not yet been published, it is well known here that his experiments show the average strength to be 40 per cent., or 1 degree higher than I have given it.

"Port wine is less apt than other wine, even, perhaps, than sherry, to deteriorate in the hands of the foreign purchaser; but this has occasionally happened, to the great loss of the shipper, who virtually guarantees what he exports against degeneration."

Hospital Report.

ST. BARTHOLOMEW'S HOSPITAL.

Cases under the care of Mr. HOLMES COOTE.

FRACTURE OF TIBIA AND FIBULA, SUCCEEDED BY TYMPANITIS.

GEORGE K., 32, upholsterer, a man of intemperate habits, was thrown in a scuffle by one of his companions, June 25. The right foot turned under him, and he fractured the tibia and fibula near the ankle-joint. Admitted about 11 A.M. on the same day. The bones were put into proper apposition, and splints were applied. He was ordered full diet, and a pint of porter daily, and seemed for the next two days tolerably comfortable.

On the night of the 27th, he became restless and excited.

On the 28th—One-third gr. of acetate of morphia was injected under the skin, and forty minims of tincture of opium were administered.

On the 29th, no improvement being recognised, he was ordered one minim of croton oil. No action of the bowels ensued, but he became quieter till evening, when he was more restless, and again had forty minims of tincture of opium.

During the course of the 30th he had three injections, which were followed by copious evacuations. He was very restless during the night.

On the 1st of July he was very low; pulse very feeble; voice low; extremities cold. He was also very sick, and tympanitis supervened. He had injections of essence of beef, and brandy, &c.

On the 2nd he was better; sickness less; extremities warm; less tympanitis.

From this date he gradually improved.

NELATON'S GAS CAUTERY.

Our attention has been directed to a case in St. Bartholomew's Hospital, in which Mr. Coote has employed with success the gas cautery introduced by M. Nélaton. It was a case of cancer of the face in a sailor about 50 years old. He was admitted to the hospital under the care of Mr. Holmes Coote, at the end of May, with a large open sore involving both right eye-lids and a considerable part of the right cheek. The sore varied in depth, and was covered with a thin, yellow discharge; and at times the patient suffered from severe lancinating pains. Nitric acid had previously failed, as did also opium lotion and Vienna paste, both of which were prescribed in the hospital.

Mr. Coote determined to resort to the gas cautery, which was accordingly applied, and as the effect seemed beneficial, was repeated on two or three subsequent occasions. Under this treatment the discharge lessened very much, and the lancinating pains became less distressing. More important still, a very great contraction took place, so that, after a time, the sore was less than half the size it had been at the commencement of the treatment by cautery. It would appear from this that the gas cautery is likely to be of great

service in those cancerous ulcerations of the skin which so frequently attack the face. Where the disease is very limited, or in positions where the flame cannot be used, the heated platinum points recommended by Mr. Bruce are very useful; but Mr. Coote stated that, where it is practicable to employ it, he prefers the flame. He considers that not only is its action very rapid in destroying the cancerous tissue, but that it actually arrests the progress of the ulceration. In the case above mentioned both the flame and the heated platinum points were used, the latter in consequence of its being impossible to direct the flame upon the whole surface of the sore, from its position rendering it impracticable to protect the eye. The first effect of the flame is to char the surface, which afterwards remains dry, and very rapidly contracts; and this contraction may, perhaps, be looked upon as the first effort towards an attempt at repairing the injury. Finally, as the idea of applying actual flame to the body is always suggestive of intense agony, we are desirous of mentioning the impression produced on this patient, that the gas cautery is a less cruel application than the Vienna paste, since the pain produced by the latter continues for a long while—a fact with which all Surgeons who use it are too familiar; while, with the gas cautery, the pain does not last long after the flame is withdrawn. Should this be found to be usually the case, we cannot but think that it will contribute greatly to the general adoption of this plan of treatment. The impression produced by this case on those who witnessed its effect is evidently most favourable, and no doubt we shall soon have the opportunity of recording further instances of its employment. We believe Mr. Coote himself is likely to give it a more extended trial, and we have to thank him not only for his courtesy in pointing out to us this and other interesting cases, but for the candour with which he spoke of his own impressions of the cases, and thus, as it were, placed at our disposal his own vast surgical experience.

Foreign Medical Literature.

CASE OF
OSTEOMYELITIS SPONTANEA DIFFUSA.

By P. THILESEN.

TRANSLATED FROM THE NORSK MAGAZIN FOR LÆGEVIDENSKABEN, XXI. BIND, I. HEFTE, CHRISTIANIA 1867, P. 3.

By WILLIAM D. MOORE, M.D., Dub. et Cantab., M.R.I.A.;

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS; OF THE NORWEGIAN MEDICAL SOCIETY; AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; SECRETARY FOR SWEDEN, NORWAY, AND DENMARK, TO THE EPIDEMIOLOGICAL SOCIETY OF LONDON.

(Continued from page 136.)

As the reader cannot from this one case get any general or comprehensive view of this hitherto little-known disease, I shall, in conclusion, add some extracts from the most important parts of the late Hermann Demme's remarkable work upon "Osteomyelitis spontanea diffusa," (1) its nature, course, and treatment, with some remarks derived from Professor Richard Volkmann's essay on the same disease.(2) Even J. L. Petit (18th century) had rather a correct idea of inflammation of the medulla of bone. He, like all subsequent writers until Chassaignac, knew it, however, only in connexion with, and as a result of, solution of continuity of the bone. Chassaignac, on the contrary, first in his *Memoire sur l'Osteomyelite* (1853), distinguished and anatomically and clinically described a spontaneous or essential osteomyelitis, which, as the name indicates, had nothing to do with solutions of continuity of the bones. From 1858-9, the subject of the nature and symptoms of this disease was treated by Klos and Gosselin, and subsequently, 1860-1, by Frank and Fischer, all of whom put forward the separation of the epiphyses of the bone as one of the constant symptoms in this disease, identifying, as it were, the inflammatory separation of the epiphyses with osteomyelitis. This is not correct. Separation of the epiphyses may indeed take place, but it may also be wanting, and is, moreover, met with in other very different affections of the bones, as in periostitis, acute articular inflammations, defined inflammations of the boundary of the epiphyses (*ostitis epiphysaria circumscripta*). As much relating to this affection still remained obscure and uncertain, both in this and in many other respects, which is sufficiently evident from the discussion elicited by Roux, in 1860, in the French Academy, Hermann Demme, at the time Lecturer in Surgery in the University of Bern, where his father is Professor of Surgery—determined to investigate this affection more fully, for which Bern offers special facilities, as the disease is there rather frequently met with (as is the case also in the neighbourhood of Marburg and Halle, while about Berlin it is said to occur very rarely—*Richard Volkmann.*) He did not arrive at the same results as Chassaignac and Klos. He found that we must distinguish between two forms—one circumscribed, essentially local, and generally spontaneous, or after treatment terminating in recovery; and a diffuse form, which is a disease of a very serious nature (*Typhus des Membres*—Chassaignac), constantly threatening the existence of the bone, in general, in the most critical mode, bringing the whole system into a state of suffering, and often, by the development of pyæmic and septicæmic conditions, menacing life itself. Richard Volkmann, who in other respects, in all essential points, shares Demme's views as to this disease, calls attention to the fact (*loc. cit.*) that in his district (Halle) a subacute form of the same commonly occurs, which is by no means so dangerous as the form described by Demme.

In the first stage, which we do not very often happen to see, the bony medulla is, through a greater or less extent, sometimes over the whole both diaphysis and epiphysis, strongly hyperæmic, sometimes bluish red, swollen, and infiltrated with serum. With active nucleus and cell-formation from the connective tissue cells of the medulla, the medullary tissue is changed to granulation tissue (fœtal medullary tissue). Gradually this comes to an abundant suppuration. The pus does not collect in large cavities, but becomes infiltrated more uniformly through the whole tissues. The osseous framework meanwhile perishes, sometimes to such an extent that only the solid cortical substance remains, of an occasionally comparatively slight thickness, while the interior of the whole bone forms a single canal filled with infiltrated medullary tissue. Sometimes we meet (as Chassaignac and Klos especially have shown) with total necrosis (through the whole thickness). The periostitis always accompanying it has, in general, the same character and extent as the existing osteomyelitis. It is, therefore, in general purulent. The pus formed from the periosteum is found either within the latter, in its tissue, or between it and the bone. The extra-periosteal suppuration, which is always connected with an infra-fascial phlegmon, is most frequently inter-muscular and subcutaneous. In the interstitial periostitis the membrane is infiltrated through its whole mass, small abscesses here and there in the same, often ulcerate larger portions. Sometimes productions of connective tissue from the attacked periosteum, which penetrate into the bone, destroying the latter, are met half way by similar productions of connective tissue proceeding from the medulla. In this mode perforation of the bone is frequently brought about. If the pus collects between the bone and the periosteum, the former is often denuded through a great extent, and dies throughout a greater or less circumference. If rupture of the membrane and evacuation of pus in the surrounding parts occur early, the periosteum may again become connected to the bone, and necrosis be avoided. Chassaignac was the first to direct attention to the articular affection characteristic of the disease. The connection is so constant, that Demme failed to find it in only one of the seventeen cases observed and described by him. In this Volkmann

1 Langenbeck's Archiv for Chirurgi.
2 Billroth's og Pithas Chirurgi.

also agrees. Neither of them, on the contrary, seems to agree with Chassaignac in this, that the centrally situated joint is always the affected one. So it was too in the present case, but it occurred only once in those described by Demme. Even where the osteomyelitis had its principal seat in the middle of the diaphysis, or even above the middle, there was no exception in this respect. Chassaignac always assumed that the articular affection was of the same destructive character as the process in the medullary canal; thus, according to him, it proceeded directly from the same, partly by propagation to the joint of the existing ulcerative and destructive process of fusion, partly by perforation of the articular cartilage, and of that of the epiphysis by pus, and the influx of this sanious and bad matter into the cavity of the joint. In this view of the relation between osteomyelitis and the articular affection, Dr. Paul agrees with Chassaignac. Demme considers this connection between these two affections to hold good for only extremely few cases. In the majority of instances, the articular affection is of very slight importance. Frequently it consists only in an acute œdema, a dropsy of the joint, a result of the increased pressure in the capillaries and veins of the synovial membrane, caused by existing osteo, and periosteophlebothrombosis. All is then in general at last resorbed. Often enough the affection is an articular empyema, a superficial production of pus from the synovial membrane, the same as Volkmann in Langenbeck's *Archiv*, B. 1, Heft 2, describes under the name of catarrhal articular suppuration, only a further development of the previous form, and, like it in general, ending in complete recovery. He acknowledges, however, that the articular affection may also be of a very serious nature. Thus a deeper, destructive articular inflammation may be developed embolically, most frequently suddenly, and with peculiar general symptoms; this, however, is not to be considered as any direct propagation of the osteo-myelitic process. The suppuration is then in general of a bad type, leading to great and deep destruction of the cartilage, and the most favourable termination on the whole, is anchylosis of the joint. Finally, we have the last and rarest kind of articular affection, described by Chassaignac as the only one, that, namely, propagated directly from the medullary canal (propagation of the process, or perforation of the cartilage, see above). Volkmann, as I have said, quite agrees with Demme in this view of the several kinds, degrees of importance, and modes of origin of these articular affections. As to the separation of the epiphysis, Demme distinguishes between a loosening and bending, and a complete separation of the same. The incomplete separation is not mentioned by the earlier writers on this subject; according to Volkmann and Demme it is, however, much more frequent than the complete separation. Demme saw complete separation only in two of his seventeen cases, and in both of these, reunion of the separated parts was effected by new formation of bone. The separation is quite naturally produced by an extension of the osteo-myelitic process to the membrana pulposa of the boundary of the epiphysis. As ossification of the epiphysis should be complete at all events before the 25th year, one would believe that separation would not be possible after that age. Demme has, however, an example of such separation in the 25th year, and Volkmann even in the 30th and 50th years. Bony or fibrous union of the separated parts often occurs subsequently, and the result is by no means unfrequently decided lengthening of the extremity.

The phlegmonous inflammations, which are always developed in the neighbouring soft parts, have been already mentioned. They may attain a considerable extent, and occasion great destruction.

Volkmann points out that osteo-myelitis may occur contemporaneously in several parts of the skeleton (*osteomyelitis spontanea multiplex*).

The disease occurs with variable frequency. In and around Bern, Halle, and Marburg, it seems to be rather common, while in other places it has never been observed. Demme connects this with the frequent occurrence of rheumatic affections in his country. In all his cases hard work and exhaustion preceded the attack. It is certain that traumatic causes, contusions and commotions of the bone, with extravasations of blood in the medulla, have been more frequently in operation than has been shown. All Demme's patients belonged to the poorer classes, and were in one way or other debilitated individuals. Their ages varied from thirteen to twenty-five years. All agree in this, that youth is especially predisposed to the disease. Chassaignac states that he never met with the affection in women. This is, however, not the rule. Volkmann says that of 23 cases, 17 occurred in women. In 73·3 per cent. the femur was the affected bone, and in 65 per cent. the left femur.

Symptoms.—In the midst of a perfect feeling of good health, the patient is suddenly attacked with a deep-seated pain of variable character, stinging, tearing or pressing, most frequently limited to a definite spot, sometimes, but more rarely diffused over a greater extent, according to the spread of the affection. The pain is increased by pressure on, and movement of the affected extremity, obliging the patient very soon to take to bed, and sometimes to avoid the slightest active or passive movement of the part, and to lie quite motionless with the extremity flexed, or in the position which relaxes the limbs most, and is therefore the most convenient. During the first few days there is, notwithstanding the violent pain, no swelling of the bone, it is often eight days before any such takes place, the swelling generally occurs between the third and eighth day. This is very characteristic, and a good diagnostic between this affection, and periostitis and phlegmon—(R. Volkmann.) After the pain has set in, but before there are as yet any objective phenomena from the bone, we have signs of general affection, intense fever, repeated rigors; at first the fever presents the character of continued fever with evening exacerbations; but it soon, sometimes in the first, but more generally not until the second week, assumes a typhoid character, with violent headache, sleeplessness, delirium, a brown and furred tongue, fœtid and copious diarrhœa and great debility. With these symptoms Chassaignac has often seen diphtheritic affections of the throat. Demme, on the contrary, has not met with this. In the middle, or at the close of the first week, the first objective signs manifest themselves, a diffuse deep-seated swelling of the extremity, through which we can also, with tolerable distinctness, feel a tumefaction of the bone and periosteum. This latter swelling sometimes terminates rather abruptly a little above the bone, where the sensibility also ceases with it. The tumour soon approaches the surface of the skin; still there is no increase of temperature or inflammatory change of colour, the colour of the skin is rather dusky, sallow, half anæmic, with sharply marked bluish veins. The tumescence of the extremity gradually increases, suppuration supervening between the muscles. Sometimes we can also, towards the close of the first week, at all events early in the second, feel fluctuation (in the present case this did not occur until the third week). Generally this is most distinctly perceptible on the outside or inside posteriorly.

At the close of the second week, sometimes not until towards the end of the third, signs of an affection of one of the neighbouring joints supervene. Dropsy of the joint, may sometimes occur still earlier, and generally suddenly. The ulcerative articular affection begins more insidiously, almost without pain; so it is from the fluctuation we first become aware of the existence of the arthropyosis. If the articular affection, which is not often the case, is the result of a perforation of the cartilage of the epiphysis, and a sudden penetration of unhealthy pus into the cavity of the joint, it is frequently preceded by violent rigors and by an increase of the existing feverish condition. Volkmann points out that the articular affection may sometimes occur early with such definite symptoms, that it attracts to itself the whole attention of the practitioner, and entirely conceals the proper osteomyelitic affection.

The course of the disease may now be very various. Thus, the *vis medicatrix* may at this stage gain the upper hand. The general affection declines, the health improves, the local symptoms become more prominent, and during a slow and often interrupted period of convalescence permanent recovery at length takes place. In a second series of cases signs of a pyæmic and septicæmic condition are more or less rapidly developed (in Chassaignac's cases with very stormy phenomena): repeated violent rigors, affections of internal organs, the lungs, liver, kidneys; abscesses here and there with profuse unhealthy suppuration. With excessive perspiration, violent diarrhœa, increasing anæmia and hectic, death at last occurs. The separation of the epiphyses in general accompanies this stage. Demme maintains that this usually does not take place before the second month, while Chassaignac and Klos consider the usual period of the separation to be (as in the present instance) from the middle of the second week.

Although the disease only rarely takes this unfortunate turn, it is nevertheless always a very serious affection, leading to recovery only after the lapse of months or years.

Treatment.—In opposition to Chassaignac, Klos, Gosselin, Paul, and many others, who recommend early division of the soft parts down to the bone with great incisions, even before fluctuation is observed, Demme lays it down as a rule that no deep and extensive division is to be performed in the acute progressive stage. Such ought not to be made until the disease has assumed a more chronic and stationary form. He recommends at first to employ only means calculated to overcome the acuteness of the process and to promote the development of this chronic state. He rejects, however, as too weakening, and partly useless, the ordinary antiphlogistic means: venesection, leeching, blistering, the application of cold, poulticing, &c., but advises painting with strong tincture of iodine every, or every second, day. He usually employs a form recommended by his father (from 60 to 65 grains of iodine in an ounce of alcohol of 96 or 98 per cent.) This he applies with a pencil to the part until the latter has assumed a bluish black colour. At the same time he evacuates, at this stage, with the trocar, all phlegmonous and periosteal accumulations of pus, and provides for the absolute rest and convenient position of the part. Opiates are given to relieve the pain, and a moderately strengthening general treatment is adopted. When the stationary period has been reached, he divides the soft parts to a sufficient depth and extent. This he does not, however, like to do with the knife, as he dreads the loss of blood, he therefore keeps to the plan proposed by his father, of employing for the purpose the actual cautery or zinc-paste. He afterwards injects the cavity of the abscess with iodine, perchloride of iron, &c.

The borings of the bone recommended in osteomyelitis by some writers he altogether rejects. The articular affection is treated according to circumstances, by contentive bandages, &c. Sometimes opening of the joint may be necessary; in separation of the epiphyses contentive bandage; finally in the chronic stage, when protracted beyond what the strength can bear, amputation may be thought of. As to treatment, Volkmann agrees with Demme, only he does not approve of the opening of the abscess necessary in the chronic stage, being so large as Demme recommends it to be. He prefers numerous smaller openings and drainage through the same.

METROPOLITAN POOR-LAW MEDICAL OFFICERS' ASSOCIATION.

The report of this useful and energetic society is now before us, and very encouraging it is. Its action in reference to workhouse dietaries has been so fully explained in this journal prior to the publication of the report, that we may at once pass by that subject, in order to refer to some others which are equally receiving the attention of the Association. It is a matter for sincere congratulation that in so short a time so much really useful work should have been accomplished. Perseverance in the same path will undoubtedly make the society felt as an influential power.

One question, which has also been treated in this journal during the year, relates to the mode of sending pauper lunatics to the asylums. In the great majority of cases they are taken before a police magistrate, and, in many cases of recent disease, great and permanent injury is done to the patient's prospects of recovery by the impression which is created, that an offence has been committed.

All medical authorities are agreed upon this point, and the practice has been repeatedly condemned by the Commissioners in Lunacy.

A case which occurred recently, at the Strand Workhouse, and which at the time formed the subject of an article in the Medical Press and Circular, forcibly illustrates one of the evils of the present system. A lunatic had been certified by the medical officer, and the order for his admission to the asylum signed by a justice, who attended at the workhouse for that purpose. The order, through the accidental omission of a single word, proved to be informal, and after the patient had been three weeks at Hanwell, he was sent back to the workhouse by order of the Commissioners in Lunacy. The justice who had signed the order being out of town at this time, the medical officer was reluctantly compelled to take the lunatic before a police magistrate, who pronounced him sane, and sent him back to the workhouse. A committee of three guardians was appointed to investigate the state of the man's mind, the poor fellow having told them that the medical officer had declared him insane for nefarious purposes. These *experts* (!) pronounced the man sane. Meanwhile, in consequence of a communication from the medical officer, two of the Commissioners in Lunacy, visited the man, and after a patient examination, made out their order for his admission to an asylum. Before he could be removed, he eluded the vigilance of the attendants, scrambled on to the roof of a house, and sprang, from a considerable height, into the street—escaping without injury—and then wandering about the streets for three days and nights, until he was captured by the police—not having had his clothes off all the time. The unfortunate man was subsequently taken back to Hanwell, howling the whole way. We doubt not that the Association will do much good by agitating such a case as this.

Another question which has been considered, relates to the duty of the medical officer as to giving medical certificates for pauper lunatics in the workhouse.

By the Act 8 and 9 Vict. c. 100, s. 48, the medical officer was precluded from giving certificates.

By the Act of 16 and 17 Vict. c. 97. s. 67, this prohibition was removed, and, as a rule, the medical officer is called in by the justice to his assistance.

But now it is sought to be made appear that, under the 20th Sect. of the 25 and 26 Vict. c. 111 (the Lunacy Acts Amendment Act, 1862), it is the "duty" of the medical officer to give the certificate in all cases. At any rate, the report before us states that one board of guardians has taken this view of the case, and compels its medical officer to give the certificates. In this particular instance the police magistrate calls to his aid another surgeon, who has access to the medical officer's certificate, and receives the customary fee for his services. The medical officer having appealed to the Poor-Law Board they stated their opinion that "the latter part of Section 20 of the 25 and 26 Vict. c. 111, requires the medical officer to give the certificate therein referred to, if he is called before the justice, under 16 and 17 Vict. c. 97, Sect. 67, and attends accordingly. In that case he would be entitled to reasonable remuneration, under sect. 69, of the latter Act."

This opinion was naturally deemed satisfactory by the Medical Officer, but the Board of Guardians, having taken counsel's opinion, and enjoying the privilege of a local act, refused to adopt it, and there the matter rests at present.

The Council of the Irish Medical Association have proposed to admit the members of the Metropolitan Medical Officers' Association to be "enrolled without the payment of any subscription or fee, *ad eundem* members of the Irish Medical Association," a compliment which has been very cordially accepted.

Should the changes in the system of medical relief, &c., about to be inaugurated in the metropolis, turn out as well as expected, the benefits conferred by Mr. Hardy's Act will doubtless be extended to all parts of the kingdom. To enable provincial brethren to co-operate in the work of the Association, a third order of members, called associates, has been instituted

—all poor-law medical officers resident without the metropolitan district to be admissible on payment of a small annual subscription.

A year ago the Association commenced its career with twenty-nine members, all of them being Metropolitan Poor-law Medical Officers. It now numbers upwards of fifty members, and has received assurances of sympathy and support from others who have not felt that it would be *safe*, under existing circumstances, openly to join its ranks.

There have also been elected a very large number of honorary members, many of whom have taken a warm interest in the proceedings of the Association, and in all questions affecting the welfare of the sick poor.

The expenditure of the year has been large, but we are glad to observe that the treasurer still has a balance in hand, although a small one.

The report expresses a deep gratitude to the medical and general press for the publicity granted to the proceedings of the Association, and for the generous support accorded to its views and objects. We may accept the thanks proffered so far as we are concerned, and take the opportunity of saying we shall ever be ready to aid every movement calculated to improve the status of the profession, and to promote the welfare of the sick poor. We could, therefore, scarcely do less than wish this Association a hearty God speed. We now congratulate them on their success.

At the annual meeting held at the Freemason's Tavern, on the 30th July, and which was largely attended, both by old and new members, the President (Dr. Rogers) in the chair, the following resolutions were passed :—

1. That the report of the council be received and adopted, and that the recommendations of the council be carrried out, viz. :—That the rules as revised and now read be the rules of the Association ; that members be admitted in future without payment of entrance fee ; that a third order of members be created to be called Associates, such associates being Poor-law Medical Officers residing without the metropolitan district, and that the annual subscription of an associate be five shillings.

2. That the Association having considered the present practice of taking pauper lunatics before a police magistrate, is of opinion that it is fraught with evil ; often gives rise to painful scenes in court ; and, in the case of recent mental disease, is calculated to prejudice the patient's prospects of recovery, by creating an impression that an offence has been committed.

The Association recognizing, with satisfaction the fact that the Commissioners in Lunacy object to the practice in question, requests the council to use their best endeavours to obtain an alteration in it, so that every lunatic may, if possible, be visited by a justice or clergyman at the workhouse.

3. That the council be requested to take steps to ascertain what is the duty of the medical officer of a workhouse with respect to giving certificates of insanity (Schedule (F) No. 3 to 16 and 17 Vict. c. 97) for pauper lunatics, having special reference to Section 67 of that Act, and Sec. 20 of the 25 and 26 Vic. c. 111, and to report upon the subject at the next general meeting of the Association.

4. That the thanks of the Association be presented to the officers and council for their services during the past year ; and to the President for his conduct in the chair at the present meeting.

Review.

MENTAL PATHOLOGY AND THERAPEUTICS. By W. GRIESINGER, M.D. Translated from the German by C. LOCKHART ROBERTSON, M.D., and JAMES RUTHERFORD, M.D. The New Sydenham Society. London, 1867. Pp. 530.

THE New Sydenham Society deserves well of the profession. It has done much to improve our medical literature, by laying open to British medical practitioners the newest and best works of their continental brethren. By thus imparting to us the fruits of the labours of medical writers in other countries, this excellent society has effectually assisted to dispel unworthy prejudices and old jealousies, making us feel that whatever country they may inhabit, all true physicians are in reality fellow workers in the sacred cause of humanity and of science. The work now before us is not unworthy of a place in this collection, and it may be read with advantage by every member of the Sydenham Society interested in the study of medical psychology.

Mental disease is becoming every day a subject of greater interest to the medical practitioner. It would seem as though the tendency of the over mental exertion, consequent on the advance of civilization, which is characteristic of the present day, and the influence of which extends into every rank and condition of life, is to produce mental disease. At any rate, be the cause what it may, this much is certain, that insanity is increasing, in proportion to the population, every succeeding year ; and, hence, it becomes a matter of absolute necessity that every medical practitioner should be as conversant with the causes, the symptoms, and the treatment of insanity, as he is with all other diseases. We have seen no work which seems more likely to be the future text-book of mental pathology and therapeutics, than this of Dr. Griesinger's. Into the philosophical and metaphysical subjects, discussed by Dr. Griesinger, we shall not attempt to follow him, as his views and ours do not coincide on several important points, and as our space would not allow us to argue these topics in this place. Moreover, Dr. Griesinger's treatise is less readable, and, perhaps, less suited for the requirements of the ordinary practitioner, who may be called, in the course of his practice, to test or to treat a case of insanity, than the well-known works of Richard, Conolly, or Forbes Winslow, on the same subject. But as a comprehensive and scientific treatise on the diseases of the mind, this volume appears to us to occupy a very high rank indeed. It is divided into five books. In the first, Dr. Griesinger discusses the minute anatomy of the brain and its functions, in health and in disease. The next book treats of the causes of insanity, and is succeeded by an elaborate classification of the forms of mental disease. In the fourth part the pathology of the mind is considered ; and finally, in the fifth part, Dr. Griesinger affords us a well digested summary of the whole work in the chapters on the prognosis and therapeutics of the various diseases of the mind. Dr. Griesinger is entirely opposed to the employment of corporeal restraints in the treatment of the insane, and as this remnant of the barbarous treatment of persons of unsound mind, which, until a comparatively recent period, was universally practised, unfortunately still prevails in some continental lunatic asylums, it is satisfactory to find that Dr. Griesinger quotes with approbation the late Dr. Conolly's well-known aphorism, that in the treatment of insanity "restraint is synonymous with neglect." Dr. Griesinger's opinion of the value of the various specific plans of treatment recommended by some writers on insanity, is the same as that entertained by the most competent authorities in this country. He says :—"In mental, as in many other diseases, the simple expective and dietetic treatment—which is so far removed from meriting the absurd reproach of the do-nothing—is in many cases, though not in all, far in advance of the employment of very active and often changed remedies To how small an extent their recovery is, properly speaking, due to direct medicinal interference, is seen from the similarity of statistics furnished by various asylums where the methods of treatment are essentially different. It has now been long admitted that mental diseases are not to be cured by any special method of treatment ; a conclusion based on the fact that, in the two sections of the bicêtre where these directly opposite methods were followed, the results as to recovery were exactly similar."

The style of this book is far from pleasing, and affords a good many examples of those long sentences, polysyllabic-compound words, and vague phrases, in which most German writers love to conceal their ideas. Still, despite these imperfections, the work has much merit, and those who take the trouble to open the hard German shell in which the kernel of Dr. Griesinger's ideas is sometimes hidden, will, we think, be amply rewarded by the rich store of original information, evidently the result of long experience, and well exercised powers of observation, contained in the volume now before us. We cannot refrain from regretting that the eminent physicians who have so ably and so accurately performed the laborious task of translating the work, have confined themselves so closely to rendering the original text, and that they did not give us in the form of notes their own opinions on some of the more difficult questions of mental science treated by Dr. Griesinger. We trust that in the next edition. Drs. Robertson and Rutherford will do this. As it is, they have rendered an important service to English students of psychological literature, by placing within their reach the most recent German text-book of mental diseases.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 28, 1867.

THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND ITS LICENCE.

THE London College of Physicians has at length decided upon the educational programme for its future Licentiates. The decision, we believe, was not arrived at without much discussion, and not even then with unanimity.

"Drei Jahr' ist eine kurze Zeit,
Und Gott! das Feld ist gar zu weit."

The step promises well for College coffers, and will, we trust, prove as creditable to College honour. We must not, however, hazard an expression of our doubts or fears upon the matter, lest we should be as fiercely reproved as was that ill-boding prophet by the Grecian King, during a certain memorable siege.

But the College must take heed lest a strife as long and fierce should one day rage within and around its walls.

The candidates for the licence, allured by the easy terms held out, will eventually become a very numerous body, and naturally seek a more definite *locus standi* in the College. The outer world will regard them to all intents and purposes as Physicians; indeed, the "Medical Directory" already invites them at their option to add "*Phys.*" to their titles. They may (and, perhaps, not unreasonably), consider themselves as equals of the Members who had the ill-luck to be admitted during the year of grace. But, we return to this point anon. The Fellows, anyhow, will have no just ground for complaint, nor will the matter concern them much at present. They are denizens of a higher atmosphere. Some among them would seem to have been "born to greatness," and simply take possession; others (and many they be) "achieve greatness," while not a few "have greatness thrust upon them," without the cost of midnight oil, and risks on wearied brains:—

"Ein Titel muss sie erst vertraulich machen,
Dass eure Kunst viel Künste übersteigt;
Zum Wilkomm tappt ihr dann nach allen Siebensachen,
Um die ein andrer viele Jahre streicht."

But of that middle class yclept the "Members," what is to be their destiny? The old proverb of the greatest safety being "*in medio*," clearly does not apply to these. The line which separates them from the Fellows seems distinct enough, while that which separates them from the Licentiates strongly reminds us of Euclid's definition. The formal bye-law, "*Members of the College, present and future, shall be alone eligible to the Fellowship*," reads like pure mockery to the multitude. The Fellowship doors, so closely barred in front as only to suffer with difficulty an occasional ingress, and the Licentiates closely treading on their heels, the Members must undergo, if not a *Darwinian* struggle for existence, one at least for College rank, and, unless they bestir themselves, must eventually fuse into the intrusive race. As yet, they are a powerful body, with a very powerful voice, if they will but speak loud enough. There must be no apathy—no procrastination—if the majority would avoid being hopelessly stranded on the shores of mediocrity. They ought to urge upon the College the necessity—the justice—of placing the Fellowship upon a broad, constitutional basis, to the exclusion of all improper influence, and the College would gain infinitely in strength by granting the request.

MONOMANIA AND TESTAMENTARY INCAPACITY.

THE judgment of Sir James Wilde setting aside the will of Mrs. Thwaytes, is likely, as we have already hinted, to exercise considerable influence as a precedent. We are anxious, therefore, before public interest in the case shall have altogether subsided, to consider some of the special points to which we have alluded. Foremost of these is the doctrine, so absolutely laid down, that monomania of any kind is sufficient to invalidate a will. We are aware that the same decision has been arrived at on other occasions, but even the case of Waring *v.* Waring, cited by the learned judge, and hitherto, perhaps, the most conclusive on the point, will probably henceforth yield in importance, as a precedent, to the more recent judgment under consideration.

Nothing can be more decisive than the manner in which Sir James Wilde lays down the law that

"A person who is the subject of monomania, however apparently sensible or prudent on all subjects and occasions other than those which are the special subject of his apparent infirmity, is not in law capable of making a will. This has been clearly decided in the several cases quoted at the bar, of which it is only necessary to name that of 'Waring *v.* Waring.' It is needless to travel over the paths by which this conclusion has been reached. It is properly the starting point in such an inquiry as the present. I conceive the decided cases to have established this proposition, that, if disease be once shown to exist in the mind of the testator, it matters not that the disease be discoverable only on a certain subject, or that on all other subjects the action of the mind is apparently sound and the conduct even prudent, the testator must be pronounced incapable. Further, that the same result follows, though the particular subjects upon which the disease is manifested have no

connexion whatever with the testamentary disposition before the court."

Now, we have no intention of attempting to controvert so authoritative an exposition of the law. Nevertheless, we deem ourselves not only justified in remarking, but called upon to notice the fact, that this judgment does not altogether harmonize with numerous precedents, nor is it in accordance with principles that have been laid down by distinguished authorities, while it is altogether at variance with the doctrines of the courts in criminal cases.

It has usually been considered that a person who fully understands the nature and consequences of the testamentary act, is of disposing mind. So reluctant have the courts been to interfere with the disposition of property on the allegation of incapacity, that it would be easy to enumerate many instances in which wills have been maintained, although the testators conduct could not *on all points* be considered sane.

The mental condition of Mrs. Thwaytes has nothing to do with the abstract proposition to which we are referring. It may be very fairly argued, that she was no monomaniac at all, but was deranged on many subjects. Such a hopelessly diseased intellect as the evidence indicated hers to have been for the last 30 years, differs wonderfully from the state we are accustomed to call monomania. No will could be expected to stand, which could be shown to have been in any degree influenced by a delusion, but that there are hundreds of monomanics moving in society, who manage all their affairs with prudence, is incontestable. Their delusions exercise no influence whatever upon their conduct, and in case of an attempt to deprive them of their civil rights, a commission would pronounce them capable of managing their affairs. Are they then to be all pronounced incapable of disposing, by will, of property they may alienate while living, as the strict terms of this judgment would seem to imply? If so, we are disposed to think that a good deal of injustice may be inflicted. Moreover, a wide door may thus be opened for a species of litigation which needs no encouragement. Discontented relations may be induced to set up opposition to wills that do not answer their expectations, and to magnify the testator's eccentricities into monomania. If while "*on all other subjects the mind is sound, and the conduct even prudent,*" one single, it may be unimportant, delusion is to render a testator incapable, nothing but much more rigid definitions of the various kinds of insanity, than have yet been agreed upon, will render valid many wills that heretofore would have been thought incontestable. The distinction between eccentricity and insanity—never an easy one—must be made more precise. The will of a man who directed his executors to have some of his bowels made into fiddlestrings, has been pronounced valid by our courts; the testator had added an explanation to his direction, to the effect that it was as a protest against the absurdities of the customs of society in reference to the bodies of the dead. It would, no doubt, be considered by many that such a mode of protesting was evidence of a monomania on the subject. The will of a suicide who, in a fit of insanity, killed himself three days after making it, has been also held valid, chiefly on the ground that no evidence of any delusion actually affecting the document was forthcoming. It is a wide-spread notion that to annul so important an act as a will, the delusion should be shown to exercise some influence over it. The duty of experts, in a commission of enquiry, has always been considered to ascertain, not merely whether delusions exist, but whether, if they do, they are such as lead to danger to persons or property. If monomania is to be sufficient to set aside a man's will after his death, it must surely be held to incapacitate him from the management of his property during his life, and this brings us face to face with the inquiry—whether the majority of men would be willing to expose themselves to such a risk? In a world in which half the inhabitants are ready to call the other half mad, are we to tremble lest every little foible, every whimsical eccentricity should deprive us of our civil rights? Are we to give up all differences of opinion and sink to one dead level lest the exercise of our mental powers should lead us to some conclusion not in accordance with the experience of others, and which might therefore subject us to interdiction while alive, or destroy our testamentary disposition after death?

We must not leave out of account, in relation to the justice of the law we are discussing, that it is diametrically opposed to the maxims of our criminal law. A monomaniac is guilty of murder should he commit homicide, unless the act originated in or was connected with his delusion. It will seem to most people manifestly unjust that such a difference should exist between our civil and criminal codes. Lawyers with whom rules and precedents have great weight, and whose knowledge of insanity is derived from others, mostly hold to the doctrine, that to exempt a man from the punishment of his crime he should be proved to be ignorant of right and wrong—as unconscious as an infant. Physicians who are brought into actual contact with insanity have been rather inclined to err, if at all, in the opposite direction. They know, as a matter of fact, that there are in our asylums hundreds of undoubted lunatics who, if the first doctrine were true, should be expiating their crimes. On the other hand it is not to be denied that many a sane criminal has been pronounced mad and sent to Bethlem. The "glorious uncertainty of the law" is nowhere more exemplified than in what relates to insanity. Nor will Sir James Wilde's judgment remove this uncertainty; for, although it lays down a fixed and arbitrary rule, it introduces fresh perplexities, and its application will demand new and more strict definitions. At the same time there is reason to fear that a rigid adherence to this decision may give rise to injustice, or possibly encourage fraud; while it increases instead of diminishing, the divergence between our civil and criminal law which, in this respect, evidently guards property more jealously than life.

Notes on Current Topics.

WATER SUPPLY AND CHOLERA.

Last week we presented our readers with a report of the important evidence of Dr. Letheby before the Royal Commission appointed to inquire into the water supply of London. The value of this evidence it is impossible to exaggerate. If Dr. Letheby stands almost alone as an opponent of the "water theory," he is well able to maintain his position, so well able, in fact, that we have preferred to report his opinions in his own words rather than give a condensed summary of them.

Leaving our readers to digest this evidence, we turn for the present to the opposite view. The 9th report of the

Medical Officer of the Privy Council has just appeared, and in it will be found a number of important papers on the subject, the conclusion at which it arrives being diametrically opposed to that of the learned Professor of Chemistry at the London Hospital.

To Mr. N. Radcliffe was entrusted an investigation into the origin of the epidemic in the eastern districts of London last year, and that gentleman, in a very able report, fully endorses the opinion that the outbreak was owing to the fault of the East London Company. In order to be thoroughly impartial we quote his own words. He says :—

"The theory which best includes the principal facts of the explosion in the east districts is that of one day's distribution of the cholera poison, in the drinking water, largely diluted, but still in an efficient state. It is not necessary for more than one day's distribution of the poisoned water to account for the ascertained phenomena ; and this assumption best permits a reasonable explanation, so far as I can at present see, of the immunity of certain districts from the explosion, for it appears that on the day early in July, when water from the uncovered reservoir was used, a certain amount of good water had been distributed before the impure water was admitted into the mains, and this might explain the immunity of certain particular spots, such as Stamford-hill and North Woolwich. It remains, then, to inquire whether the water of the River Lea at Old Ford, admitted directly into the uncovered reservoir, and subsequently distributed, was charged with cholera poison. The answer is in the affirmative. Into the River Lea passed the evacuations of the two fatal cases occurring in Priory-street, and that signalled the commencement of the outbreak (June 26th) in the east districts. It should be observed that dilution, up to a certain and extensive degree, does not lessen the activity of the cholera poison."

The various facts which first caused suspicion to fall on this company and then led to so general a belief that to it was to be traced the terrible explosion of the epidemic last year, were so fully given to our readers at the time, that we may quote another paragraph from Mr. Radcliffe's report, with the assurance that this summing up will be easily followed. He thus epitomises his indictment :—

"I have shown that the River Lea was infected with the discharges of cholera patients on the 26th and 27th of June, about 600 yards below the northern uncovered reservoir of the East London Water Company's works, and that this infection took place under conditions of temperature peculiarly favourable to the decomposition of the excrementitious contents of the river. I have shown that the northern reservoir in question is, most probably, liable to soakage from the Lea, and that water from this reservoir was distributed for domestic use to the localities supplied from Old Ford, late in June and early in July. It is difficult not to read the entire history of the explosion in the east districts of the metropolis and in their suburbs in the sight of these facts, and conclude that the northern uncovered reservoir was drawn upon within the four or five days preceding 11th July, and that the water of this reservoir had been infected with choleraic poison by percolation from the River Lea ; or that a portion of the water of the Lea so infected had been drawn directly into the service reservoirs through some flaw in the conduits leading between the covered and uncovered reservoirs."

There is no need for us to do more on this occasion than remark that Mr. Simon, in a very complimentary criticism on Mr. Radcliffe's reports, accepts his conclusion. Mr. Simon also suggests to the Lords of the Privy Council that "wilful or neglectful distribution of polluted water should be punishable under the statute law in a much higher degree than it is at present."

We wonder whether so practical a suggestion will be buried for ever in this Blue Book. If so, what is the use of the report of their medical officer to the Lords of the Privy Council?

We shall probably shortly return to this subject, as well as to a consideration of the other contents of this ninth report of Mr. Simon. A Blue Book of this kind is not to be disposed of in a single sitting, especially when it contains so much about so fearful an epidemic as the cholera of 1866. We have only been anxious, while the subject is fresh, to keep our readers fully *au courant* with all that occurs, by impartially stating the views of all authorities, without in this place advocating or endorsing any.

CHOLERA IN ITALY.

We regret that since our last remarks on this subject the news should have been continuously unfavourable. The Northern part of the Peninsula has suffered as well as the Southern. In Piedmont and Lombardy many of the pleasant valleys are more or less desolated by the epidemic. The following figures, given on the authority of the English Consul in North Italy, are up to the 15th inst. :—

	Date.	Cases.
Province of Bergamo ...	Aug. 9—12 ...	93
Province of Brescia ...	Aug. 11—12 ...	124
Province of Milan ...	Aug. 13—14 ...	94
Province of Turin ...	Aug. 7—14 ...	77
Province of Novara ...	Aug. 13—14 ...	13
Town of Como ...	Aug. 10—11 ...	2

Other parts continue to be reported as infected. But Northern Italy may be pronounced free from the disease when compared to the more southern portions of the Peninsula.

A terrible outbreak has occurred at Rome. The death of the ex-Dowager Queen of Naples, Cardinal Altieri, and the Bavarian minister, were in themselves events that could not be concealed, and which rendered it impossible any longer to deny the existence of the disease in the Eternal City and its suburbs. Add to this, that at the beautiful retreat of Albano, to which all visitors to Rome should drive, there occurred an outbreak so sudden, that in the first night there were nearly 200 cases, and this in a population, which, allowing for the late influx of visitors at the opening of the season, would not much exceed 4,000. It was to this little town, so snugly ensconced amongst the Tusculan Hills, that Cardinal Altieri—the most important personage in the Roman hierarchy after the Pontiff himself—had retired, and there toiling amongst the terror-stricken people, he too was seized by the fatal disease. Rome has too long been proverbial for its utter want of sanitary measures, that no one will feel surprised that the disease which we believe has in truth never left it since last year, should burst forth with terrible fury.

Still further south, the accounts are equally sad. In Naples different reports speak of 15 to 20 per day. The filth of this town we have previously described. In our experience it is more unwholesome than Rome itself. The bay of Naples—boasted of as the most beautiful in the world—is but one huge cess-pool, and the Neapolitans have spent a dozen years in preventing an English gentleman carrying out a scheme for giving them good water. From Catania and Girgenti improvement is reported.

In Palermo the scourge is very fearful ; 100 victims were buried in one night, and about 100 more remained unburied for want of persons to perform that duty. On the 10th inst. there were 405 cases, of which 322 were fatal. There is a complete panic, and no doubt many people really die of fear. The absurd belief that the doctors poison the water

at the instigation of the government, still prevails. Besides the numbers given above for the city, in the provinces of Palermo there were 92 cases, out of which 85 were fatal on the 10th. The bulletin of Catania for the same day gives 30 cases, and 22 deaths. Some deaths have also taken place at Messina, where the greatest anxiety prevails. For the whole of Sicily the reported cases in the week ending the 8th, were 6719, and the deaths were 4842. In the week previous, the numbers reported were 6612, and 3512 respectively.

SCOTLAND.—STATISTICS.

The return of the Registrar-General for the second quarter of 1867 has just been published, and is, on the whole, favourable in Scotland, as in England generally. It seems that no epidemic has been prevalent there during those months. Fever, in general, and the diseases of children, where they have occurred, have retained their ordinary features, and no cases of epidemic cholera have been recorded. The whole number of deaths registered in Scotland in the quarter is 17,467, the proportion being 22·0 to every 1000, which is somewhat less than the average of the same quarter for the preceding ten years, but above the proportion in England, the latter being 21·1 per 1000 of the population. In comparing the town and country districts, the Registrar-General remarks the fact that, though taking the whole of Scotland, the mortality was less than in the same quarter for the past ten years; yet there was great disproportion between the town and country districts, 11,159 of the deaths being registered in the former, and 6305 in the latter. If, therefore, the towns were taken alone, the mortality would be in excess, the proportion there being 25·9 per 1000, but only 17·3 in the country, so that the more favourable condition of the rural districts has more than balanced the increased mortality of the towns, and reduced the general average below that of the past ten years. It was found also that as the weather became warmer the deaths diminished. In April, when the weather was cold and rainy, and the mean temperature 43·3 deg., the deaths were 206 daily. May, also, was cold, especially towards the end, but the mean temperature was higher, being 47·5 degrees, and the daily deaths were reduced to 194; while there were only 174 deaths daily in June, when the weather had become warmer and the mean temperature had risen to 54·3 degrees. This latter month was peculiar in its character this year. It was cooler than the average of former years—there was more cloud, less sunshine, and less rain, though more humidity in the atmosphere. There was frost on the morning of the 21st. The births registered in Scotland were 30,393, or 38·3 per 1000, which was much above the average. Of these 2730 were illegitimate, that is, 89 per 1000, or one in 11 of the whole number. After allowing for emigration, the increase of the population was 8244 in the quarter. There were 5602 marriages in the same quarter, or 7·0 per 1000 of the population, the exact average of the season for ten years past, but below the proportion of 1866. It is found also, as in England, that where trade is good and wages high, the marriages increase, but, when trade declines, the marriages become less, and the rate of illegitimacy higher. Thus, in Tomintoul, in Banff, there were no marriages last year, and the illegitimate offspring was proportionately higher.

THE PUBLIC HEALTH.

In the thirty-third week of the year, ending August 17th, there were 1391 deaths registered in London. This is 54 in excess of the estimated average corrected for increase of population. Thus, the long period in which the deaths have been below the average has closed, and we now have an excessive mortality. The deaths of 181 children and 19 adults were caused by diarrhœa, and 11 children and 4 adults died from cholera or choleraic diarrhœa. During the corresponding week last year, the deaths from diarrhœa were 194, and from cholera 455. The Registrar-General remarks, that although the great heat which prevailed has not increased the mortality to a great extent, every precaution should be taken at a time when cholera is epidemic on the Continent. The remarks we have lately felt called upon to make on this subject, could not receive more decisive confirmation. The mortality of London, Liverpool, Manchester and Birmingham, have all been increased during the last few weeks by the prevalence of diarrhœa. The fatality of this disease last week, was in every thousand persons living, 3·4 in London, 5 in Liverpool, and 6 in Birmingham. The number of the last town is remarkable since it is usually comparatively free from the disease. The devastation produced in Italy by cholera, ought to be sufficient to urge our home authorities to the utmost exertion. It is idle to ignore the danger until too late. Mere spasmodic efforts made in the moment of terror will never be equal to the continued, calm preparation, with which it is our duty to await the enemy. Pure water and plenty of it, the complete cleansing of all foul streets and filthy alleys, the removal of all offensive heaps of decaying matter, a constant war against all kinds of dirt—these are the resources to which we should resort, not merely in times of epidemic, but regularly throughout the year, and with redoubled stringency in such tropical weather as we have lately experienced. Once more we urge the discharge of these important duties. Last week the annual rate of mortality in London rose to 24 per 1000. This fact ought to suffice. In Dublin it was only 21, in Edinburgh 22. In Birmingham, Liverpool, and Manchester, it reached 24, 27, and 26, respectively. In Glasgow it was 25, and in Salford actually 28. The figures speak for themselves.

THE LATE CONVICTION FOR RECEIVING A LUNATIC PATIENT.

We beg to call the attention of the Medical Registrar for England to the trial reported in our columns last week. The defendant was convicted of illegally receiving a lunatic. There is, however, a circumstance which is not mentioned in our brief report, but which may interest the Registrar. In his opening speech, according to the *Ipswich Journal*, the learned counsel (Mr. O'Malley) said, "Here was a man who called himself—he said, called himself, for they had no knowledge whatever of the fact—a medical man, but he signed himself M.D. in his communications, and who stated that he had been engaged in the same business for some years." We find also in the evidence that a letter was sent in which is the following sentence:—"I have practised as a physician, exclusively in mental diseases for twenty years, and during some period of that time I was connected with the management of a public institution." Now, if the defendant possessed the right to "sign himself M.D. in his communications," he will pro-

bably take means to explan how the learned counsel's observations should have been left unanswered. Otherwise, we think it concerns the Medical Council to know by what right he has practised as a physician so many years. It would further be interesting to hear in what capacity he was "connected with the management of a public institution." The phrase is curiously vague.

DR. ROSS AND THE VICTORIA CROSS.

The performance of surgical duties under circumstances of the greatest personal risk would seem deserving of the Victoria Cross, the most highly prized distinction our Sovereign can bestow. Yet the surgeon of the 67th Regiment, which Dr. Ross then was, must be content to have this honour refused because foreign service deprived him of the opportunity of verifying and urging his claim at an early date. So the memorandum of the War Office, "Too late," would lead us to suppose. At the storming of the Taku Forts, Dr. Ross rushed across the open to aid a wounded man, and leaving Mr. Richardson, his hospital assistant (who has been decorated with the V.C.), to follow up his treatment, returned at great personal risk to attend a soldier of his own regiment, as well as his Colonel afterwards. After a careful study of all the circumstances, as attested by certificates usually produced on such applications, we feel confident that this distinction was never more fully earned.

VACCINATION RETURNS.

In the year ending Michaelmas, 1866, the number of persons vaccinated in England by the public vaccinators, in the parishes under the Poor-law, was but 460,089, and of those successfully vaccinated only 454,885. The births in the year were 743,859, so that the number of persons successfully vaccinated was equal to only 61 per cent. of the number of births, a lower proportion than has ever before been recorded in the list of vaccinations of the last fifteen years. One-fourth of the vaccinations were of persons above a year old.

THE NEW POOR-LAW.

This measure, which received the Royal assent on Tuesday week, was issued on Thursday. By it the Poor-law Board is converted into a permanent institution. By this change there can be no doubt that this central authority will acquire much greater influence. That some central authority is necessary to protect both the sick poor and their Medical Officers, and to serve as a court of appeal from the tyranny of ignorant Guardians has been too long manifest to require to be re-asserted.

THE POOR OF PARIS.

A new enumeration of the indigent poor of Paris—that is, of those who receive public assistance—has lately been published. From it we learn that, in proportion to the entire population (1,799,980), this indigent class was equal, in 1866, to 1 in 17-12. It numbered 105,119 persons, composing, 40,644 households, which is larger than the number assisted in 1861 and 1863. As usual, they are distributed very unequally among the 20 arondissements. That of the Elysée has only one in 53-65; the Panthéon one in 12-60; Ménilmontant one in 10-52; the Observatory one in 9-25; and the Gobelins 1 in 6-21. The proportion contributed by the department of the Seine is no less than a quarter of the whole number. This is probably to be accounted for by the natural attraction towards the metropolis. The average amount annually given to each household receiving relief is 48f. 65c., or 18f. 65c. per person, which is exactly 5c. a day; but, in addition, medical aid is very extensively and completely organised. The 40,654 indigent families occupy only 40,131 rooms; 9665 of these have two beds; 5422, three; 1170, four; 142, five; and there is one which contains even seven beds. Last year the total sum spent somewhat exceeded 4,000,000 of francs. Of this, 2,285,340 francs were given in the form of food, clothes, bed-linen, and small sums of ready money.

CHLOROFORM IN MIDWIFERY.

At a meeting of the Obstetrical Section of the British Medical Association the following conversation took place, which I jot down from memory, thinking that the publication of it will prove instructive and useful to many of my country brethren.

Sir James Simpson, having consented to answer any questions put to him on the subject of the administration of chloroform, commenced by stating that at the present time nearly every woman in Edinburgh was delivered under the use of chloroform, and so few bad results had occurred that he could not now refuse to any case the boon provided by science for the relief of suffering humanity. He was then asked how he used it. He replied that every one had their own favourite method; a very general way was by spreading a thin towel loosely over the face and dropping the chloroform on it. For his part, he used a napkin, folded up as a cylinder, dropping the chloroform on the interior, and admitting more or less air by opening or closing the end of the cylinder remote from the mouth; he always rubbed a little fine oil over the skin of the face, to preserve it from the irritation produced by the vapour of the chloroform.

Question.—Have you known it to produce convulsions?

Answer.—When I first used it I was rather afraid of this result. But, in the first place, I never met this occurrence; and secondly, I soon found that Dr. ——, of Glasgow, introduced it as a remedy for this very affection, and its use in such cases has gradually extended. My experience would lead me rather to look on it as a prevention than a provocation to the occurrence of convulsions, and naturally so when we consider how much of the tendency to convulsion depends on the nervous excitement and irritation of unrelieved labour.

Question.—What about puerperal mania?

Answer.—I cannot recall any case having occurred where it had been used, but I will tell you a curious circumstance, knowing how extensively it is used in Edinburgh. I visited the great Lunatic Asylum of the City at Morningside, and, on enquiring, found that there were eleven cases of puerperal mania under treatment. I traced out the history of each case, and found that not one of them had been confined under the use of chloroform. Duncan and Flockhart, the chemists in Edinburgh, prepare 1400 doses of chloroform daily, now, if as many doses of salts were distributed, we would have had as many untoward events from diarrhœa as we have had from chloroform. It should be always given in the recumbent position, as most of the deaths that have followed the use of chloroform occurred in trifling cases where it was given in the upright position.

Question.—Is there any means whereby we can distinguish chloroform that is unfit for use?

Answer.—Not that I know of. It is the best way to go to the best shop.

Question.—But if the best shop be eighty miles away?

Answer.—It keeps very well for a long time, several months. (Here Dr. Macnamara stated that good chloroform should smell sweet and free from acid, and if dropped on the hands should leave no smell after a few minutes.)

Question.—When do you begin to give it?

Answer.—Well I can't exactly tell you. A good rule is whenever the patient begins to weary of pain. She should be allowed to inhale it only when in pain, and not during the intervals.

Question.—Have you found it promote hæmorrhage.

Answer.—I have not. The moment the head is born you should sweep away the towel and use the chloroform no longer. If you adopt the plan I do, I believe it is an old Dublin plan, of following down the contraction of the uterus with the hand

while the child and placenta are being expelled, and holding your hand for some time on the contracted uterus, I believe you will not meet more cases of hæmorrhage with the use of chloroform than without it. (Here Dr. Beatty entered the room, and bearing testimony to the great advantages he had found in its use, being one of the first who used it extensively in Ireland; yet, he thought that he was satisfied that its use did, in some measure, predispose to hæmorrhage, and that therefore about the close of every case in which he used it he gave a dose of ergot).

Question.—Does it delay labour.

Answer.—No, on the contr ry. I think I have often saved much time by its use.

Here Dr. Macnamara bore strong testimony to the great value of chloroform generally, and eulogized it as a boon of mercy to mankind, and stated that it appeared to him that the more wretched the sufferer the greater the need for its use.

Question.—Are there any particular symptoms indicating that chloroform is taking effect, so as to guide one how far they should go with it.

Answer.—Nothing particular.

A gentleman here asked Dr. Macnamara if he had ever observed a tendency to spit or expectorate when the chloroform was taking effect. Dr. Macnamara said such was the case, but his remarks were rendered inaudible by a movement to break up.

Sir James Simpson stated strongly that he never had heard indecent language from patients taking it, in which he was supported by Dr. Macnamara, but persons who understood foreign languages often used them.

BRITISH ASSOCIATION.

The thirty-seventh annual meeting of the British Association for the Advancement of Science, will be held from the 2nd to the 11th of September, at Dundee. The programme includes a number of subjects that cannot fail to interest the profession. The Royal Exchange Reading-room will be opened as a reception-room on Monday, September 2, for the issue of tickets to members, associates, and ladies, and for supplying lists, prices of lodgings, and other information to strangers. The member's ticket contains a map of Dundee and particulars as to the rooms appointed for sectional and other meetings. A branch post-office (which will be available also for communication between members attending the meeting) will be opened for this occasion in the reception-room. Members and associates may obtain railway pass-tickets and information of local arrangements on application to the local secretaries at Dundee. The general committee will hold its first meeting on the 4th of September, at one P.M., for the election of sectional officers and the despatch of business usually brought before that body. The general committee will meet again on the 9th, for the purpose of deciding on the place of meeting in 1868. The concluding meeting of this committee will also be held on Wednesday, the 11th of September, when the report of the Committee of Recommendations will be received. The first general meeting will be held in the Kinnaird-hall on Wednesday, September 4, at eight P.M. precisely, when Mr. W. R. Grove, Q.C., M.A., F.R.S., &c., will resign the chair, and his Grace the Duke of Buccleuch, K.G, F.R.S., &c., will assume the presidency and deliver an address. The different sections will assemble in the rooms appointed for them for the reading and discussion of reports and other communications, on Thursday, September 5th; Friday, September 6th; Saturday, September 7th; Monday, September 9th; and Tuesday, September 10th, at 11 A.M. precisely. The sections are the following:—A.—Mathematical and Physical Science—In the High School. President, Professor Sir W. Thomson, D.C.L., F.R.S., &c. Vice-Presidents, Professor Kelland, F.R.S., Mr. Clerk Maxwell, F.R.S. Secretaries, Professor Clifton, M.A., Professor G. C. Foster, M.A., Professor Swan, F.R.S.E. B.—Chymical Science—In the High School. President, Professor Thomas Anderson, M.D., F.R.S.E. Vice-Presidents, Mr. Maxwell Simpson, F.R.S., Professor Williamson, F.R.S. Secretaries, Mr. A. Vernon Harcourt, Secretary C.S., Professor Liveing, M.A., F.C.S., Dr. Russell, F.C.S. C.—Geology—In Panmure-street Chapel. President, Mr. Archibald Geikie, F.R.S., F.G.S. Vice-Presidents, Sir Philip Egerton, F.R.S., Professor Ramsay, F.R.S. Secretaries, Mr. W. Pengelly, F.R.S., Mr. H. Sorby, F.R.S. D.—Biology—In the High School. President, Professor Sharpey, Secretary R.S. Vice-Presidents, Professor Allman, F.R.S., Sir John Lubbock, F.R.S. Secretaries, Dr. Spencer Cobbold, F.R.S., Mr. H. L. Stainton F.R.S., Rev. H. B. Tristram, M.A., F.L.S., Professor W. Turner, M.B., F.R.S.E., Mr. E. B. Tylor. E.—Geography and Ethnology—In the Albert Institute. President, Sir Samuel Baker, F.R.G.S. Vice-Presidents, Mr. John Crawford, F.R.S., Sir Roderick Murchison, F.R.S. Secretaries, Mr. H. W. Bates, Assistant Secretary Geographical Society; Mr. Clements R. Markham, F.R.G.S.; Mr. O. W. Nash, Mr. Thomas Wright, M.A. F.—Economic Science and Statistics.—In Euclid-street Chapel. President, Mr. M. E. Grant Duff, M.P., M.A. Vice-Presidents, Dr. Farr, F.R.S.; Colonel Sykes, M.P., F.R.S. Secretaries, Professor Leoni Levi, F.S.A.; Mr. Edmund Macrory. G.—Mechanical Science.—In Watt-hall, Constitution-road. President, Professor W. J. Macquorn Rankine, LL.D., F.R.S. Vice-Presidents, Mr. W. Fairbairn, F.R.S., General Lefroy, R.A., F.R.S. Secretaries, Mr. P. Le Neve Foster, M.A. The following general and evening meetings have been arranged:—On Wednesday evening, September 4, at 8 P.M., in the Kinnaird-hall, the President's address. On Thursday evening, September 5, at 8 P.M., in the Volunteers' Hall, soiree. On Friday evening, September 6, at 8·30 P.M., in the Kinnaird-hall, a discourse will be delivered by Mr. Archibald Geikie, F.R.S., Director of the Geological Survey of Scotland, on the Geological Origin of the present Scenery of Scotland. On Monday evening, September 9, at 8·30 P.M., in the Kinnaird-hall, a discourse will be delivered by Mr. Alexander Herschel, F.R.A.S., on Shower-Meteors. On Tuesday evening, September 10, at 8 P.M., in the Volunteer Drill Hall, soiree. Wednesday, September 11, concluding general meeting at 3 P.M. Excursions on Saturday, September 7, and Thursday, September 12.

Correspondence.

THE INTERNATIONAL MEDICAL CONGRESS IN PARIS.

(From our Correspondent.)

From sunny Italy and Spain, from the icy northern shores of Norwegia, from the vast Russian empire, and the most distant cities of the American continent, from all parts of France and Germany, medical men gathered in Paris to attend a congress, which, whatever may be its shortcomings and its ultimate results, is certainly unique in many respects. Learned men of different branches of science have become accustomed lately to meet in large numbers, but generally their gatherings comprised only those of one nationality. It was reserved to the year 1867, and the attractions of the period of the International Paris Exhibition, to bring together those of many different countries. The congress was opened in the time-honoured school of Medicine, where many eminent French professors gave utterance to their opinions. The school is situated in the Quartier latin, and contains a large amphitheatre, capable of accommodating more than 800 visitors, of semicircular shape, receiving its light through a cupola high above the chair of the lecturer. This room was richly decorated with flags of the different nations, and though deficient in ventilation, was not altogether unworthy for such a gathering.

Shortly after two o'clock the President, *pro tem*, took the chair, and was received with loud applause by more than 800 members present. Of these we are enabled to mention the following:—Drs. O'Connor, Beigel, Oppert, Mitchell, H. B. Wright, Drysdale; Messieurs Hart, Weeden Cooke, R. Dunn, jun., all from London; Dr. Ramsay from Glasgow, Dr. Robertson from Nottingham, and Dr. B. Bucknill. America was represented in larger numbers, by Drs. J. Stearnes, J. Warren, G. B. Upham, Cotman, Bowditch, Cooledge, all from Boston; by Professor Dalton, Drs. Fergusson, Hutchinson, Downs, Haines, all from New York; Dr. W. Lewis from Philadelphia; Logan, San Francisco, and many others.

Italy had sent Dr. Pantaleoni from Nizza, Professor Gamberini from Bologna; Professor Barcelli from Rome; De Marini from Turin; Drs. Fedeli, Mazzoni, both from Rome; Pallaciaci from Naples; Sangalli, Pavia; Brunett, Padua. Petersburgh was represented by Drs. Kremiansky, Professor at the Military School; Baubnoff, *chef dans la garde*; Zizourin, Physician to the Emperor; Lashkewitz, and others; Kharkoff, by Dr. Lazarewitch; Professor Melchior attended from Copenhagen; Professor Malmsten from Stockholm, Faye from Christiania; Germany sent an unusually large contingent, with

Virchow at the head; Posner and Eulenburg, attended from Berlin; Cohen from Hamburg; Seitz from Munich; Späth and Hebra from Vienna; Halla from Prague, etc.; Professor Croiq and Vlemiux came from Brussels; Dr. Fauve from Algeria; Fonieta from Pernambuco; Barbosa from Lisbon.

The greatest number were, of course, French gentlemen. Professors Brora, Gavarret, Tardieu, Lasuège, Taccoud, Axenfeld, Denonvilliers, Hérard, Rey, Mattei, and others from Paris; Villemin, and Rollet, from Lyons; Professors Labat, Teansul, Sarramea, from Bordeaux, &c.

Professor Bouilloud bade them welcome all, informing them that three other medical congresses had met in France before, the last one being that of Bordeaux, and to this one the idea of an international one was first suggested by Prof. Gintrae. The following governments had consented to have delegates appointed and to be represented:—Bavaria, by Professor Seitz; Belgium, by Professor Croiq; France, by Professor Dèvonilliers; Portugal, by Professor Barbosa; Prussia, by Professor Frerichs.

The President closed his short but pithy address by asking the members to constitute the committee, and of the two ways he suggested that one by acclamation was at once eagerly adopted. Bouilloud was proclaimed president in this manner.

The first vice-president proposed by the Committee of Organization was Virchow, and his name was greeted with loud cheers. The same office was conferred on Halla, of Prague; Lambe, of Kharkoff; De Meric, London; Polsciano, Naples; Vleminx, Belgium; Ricord, Pavis; Professor E. Gintrae, Bordeaux; Baron Larrey, Physician to the Emperor Napoleon; Professor Tules Roux, Toulon; and Professor Tenier, Lyons.

Meetings were held at two and six o'clock P.M. on alternate days during the two weeks. A banquet at the Grand Hotel was held on August 24; no other festivities were included in the programme.

On August the 16th, only four out of the nine papers were read, and a short discussion followed. A detailed report of them will be printed.

DEATH ACCELERATED BY THE SUFFOCATING ATMOSPHERE OF THE UNDERGROUND RAILWAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The verdict given in the case of the late Mrs. Dobner, under the direction of our coroner, Dr. Lankester, induces me to intrude on your columns. Two years since, I called the serious attention of the Metropolitan Railway Directors, through their secretary, to the foul atmosphere of the railway tunnel between Edgware Road Station and King's Cross, warning them, that some day a serious charge might be laid at their doors, from the effects of the foul vapour, or in plain words, some death might occur. Such it appears has happened by the verdict, and I now repeat my warning, also the suggestions *then given*, to obviate the danger. I proposed to the secretary of the company that, as a very frequent traveller on their line, I could give evidence as to the state of air at the various stations, particularly Baker-street, Portland-road, and Gower-street, being of a nature, that some day, a passenger with delicate lungs would seriously suffer. For my own part, I now dread travelling by this line, and only to save time do so. Blessed with strong healthy lungs, I have, while waiting for a train, only a few minutes perhaps, inhaled such sulphurous vapour, that for hours after I have felt acute spasms over the region of the chest to make me quite ill and faint. I have frequently spoken to the civil porters at the stations, as to the effect the air had on them, one answer, unanimous—"Sir, it is at times, almost unbearable. What can we do, sir? we cannot complain?" A look at the blanched straw-coloured aspect of the countenances of some of these poor fellows, spoke its own tale. They reminded me of the song of the shirt, "Stitch, stich, stich, till the eyes grow dim, and face grows pale;" here it is work, work, work. Now, sir, I suppose when a bishop or a member of parliament is choked, a sensation death will stir up the directors *to do something*. I have asked the question, if any of the rat family, who delight in sewers and dungeons dark, are ever seen in the railway tunnel, the answer is "never". Master rat has clever instinct, and I expect clears out of this line pretty sharp, he does not like odour diabolic, then why are two legged animals, who pay their money for a quick run into town to have "Hobson's choice?" Well, sir, my proposition, which I mentioned to several engineers and scientific gentlemen, and met their approval, previous to writing to the Secretary of the Company, was as follows:—

"To erect ornamental iron urinals (much wanted) in several localities, between Edgware Road and King's Cross. over the arch of the tunnel, make the centre of the urinal an open cylinder, so as to allow of a current of fresh air to rush down, mixing with, and diluting the tunnel foul air, and helping the same to pass off through the cylinders or out of the openings at the various stations."

If you think that the suggestions even now repeated, are of any value, may I ask you to insert them in your widely circulated journal, and permit me at the same time to propose your sending one to any personal friend of yours, a director of this railway. It may do good.—I am sir, your obedient servant,

M'GREGOR CROFT, M.D.
Late Staff-Surgeon to Her Majesty's Royal Army Hospital.

THE EXAMINATIONS AT THE ROYAL COLLEGE OF SURGEONS OF IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I beg to forward to you the following examples of questions, put to one candidate, at the Quarterly Examination held this week at our College of Surgeons:—

1. What are the chemical reasons for supposing that a retrograde change of tissue occurs in the spleen?
2. Describe the sympathetic system.
3. Give a minute description of the schlorotic and choroid coats and iris.
4. How is decotum aloes compositum made? What are the uses of its several ingredients? What substances are incompatible with it in a mixture? What is the dose?

These questions were put in writing, to be answered in writing. The time allowed for answering these four questions was one hour—fifteen minutes to each question. The last question is very fair, perhaps, even easy, but sir, may I ask, how is a medical student or any one else to describe the sympathetic system in *fifteen minutes*? May I ask, Sir, what time has a student to study abstruse, and by no means well ascertained, chemico-physiology of the spleen, besides being well made up in the *minute* anatomy of the coats of the eye and iris. This, sir, is not all, for the candidate, who has already been asked the above questions on paper, is expected to describe, *viva voce*, the intricate anatomy of the internal ear. The other questions in anatomy and physiology put to this young gentleman (whom you may easily suppose was rejected) were concerning the ligaments of the wrist-joint and the fifth pair of nerves, the latter being by no means an easy subject to be questioned on. I am bound to say the examination in Materia Medica was all that could be desired.

The above questions in anatomy and physiology, look as if they had been put with a view of ascertaining what the candidate probably did not know, rather than with the object of ascertaining what he did know.

When, sir, it is remembered that the Royal College of Surgeons has instituted a two guinea fine for rejected candidates who again present themselves for examination, and does its best to compel them so to present themselves, by retaining a large portion of the fees, (paid before the candidate is granted an examination), the whole affair bears a very unpleasant aspect.

Leaving the matter in your hands, sir,—I remain, yours truly,

M.D. (Dub.), L.R.C.S.I.

[Is the Royal College of Surgeons in Ireland over sanguine in expecting from its Licentiates a knowledge of the sympathetic system, the coats of the eye, or the constitution of compound decoction of aloes? Surely if such information be beyond the calibre of any student, the accession of such a person into the ranks of the profession will do no honour to the college through whose portals he receives entrance. No doubt the more practical questions have received attention at the *viva voce* examination. It is at least fair that a candidate who is unable to pass his examination should reimburse the college for the expense, which is not done to the fee of two guineas.—ED. M. P. & C.]

THE COLLEGE OF PHYSICIANS OF LONDON.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Your correspondent "Anti-humbug" has most strangely perverted my meaning. I have no objection to the Licentiates spreading themselves over the country, and rivalling, so far as they can, the other grades. Still less do I object to your correspondent, or any one else, fancying his license the best title

The point of my remark was that numbers of them were dubbing themselves *doctor*. Now, sir, the degree of doctor can only be conferred by universities; the college has no power to grant it. In fact, because men of the lower grade have not been sufficiently sensitive on this point of honour, the college makes them promise not to use the title of doctor unless they are doctors. Yet, after their promise, they do so. Scores of men can be pointed out who, on the strength of this licence, call themselves doctor. Their object is, of course, to deceive. The college is supposed to be composed of *gentlemen*, yet when we let in this lower grade, this is how our securities for gentlemanly and honourable conduct are laughed to scorn. I say, sir, that every man who uses a title which makes the public think him a graduate of a university, unless he be a graduate—however many diplomas he may possess, and whatever he may sign himself—is a complete and unmitigated humbug. I will blackball every such man who may be proposed for a higher grade as unworthy to associate with gentlemen.—I am, &c.,

A Fellow.

EXTRAORDINARY QUINTUPLE CHILD-BIRTH.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I beg to send you the following particulars of a very extraordinary and, I would say, unparalleled case of child-birth which occurred in my dispensary district a few days since, and from the extreme rarity of such an occurrence I hope you will consider it deserving of a corner in your popular and scientific journal.—Yours, obediently, T. W. Sproule.

"Fanny Mullen, ætat. 30, wife of a labourer in the neighbourhood of Moville, County Donegal, and the mother of six children, was taken in labour at five o'clock A.M., on 1st August, just about the end of the seventh month of her pregnancy. The midwife who attended her in her six previous confinements was soon in attendance. About seven o'clock A.M., a small living child was born by breach presentation; the existence of another child was immediately discovered, when the nursetender became alarmed and sent for the nearest medical man, but before his arrival five children, and all alive, were given birth to—three boys and two girls, at intervals of from five to eight minutes from each other. The placentæ, of which there were three, quite separate from each other, two of them having two umbilical cords each attached the third one, were speedily expelled; no unusual hæmorrhage or exhaustion followed. Four of the children survived an hour, and died within a few minutes of each other; the fifth, a female and the last born, lived six hours, and was so vigorous that, notwithstanding its diminutive size, hopes were entertained of its surviving.

"The children, which I had an opportunity of examining, were all well formed and well nourished, and all very equal in size, about 12 inches long, and resembled very much in size and appearance, well developed six months' fœtuses. The mother of the children is progressing favourably."

DISPENSARY VISITING TICKETS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—On the 20th inst. a policeman brought me a visiting ticket (duly signed by the relieving officer), to go and see a farmer in comfortable circumstances, who got a beating on the 18th inst. On the back of it was written the following—viz., "As I understand it, the police wish that the Doctor should see Hoy, not to attend him as a doctor, or prescribe for him, but simply to be able to speak on a future day as to the state in which he may find him." This was also written and signed by the same functionary.

It was the desire of the farmer to get my attendance on a ticket, which was refused by a neighbouring magistrate, to whom application was made, and who attended the day before to take his depositions, and the police economising in order to find out his state, succeeded in obtaining the visiting ticket. As it would be well to show up such little curiosities, *pro bono publico*, and if you should think this deserving it, please insert in your Journal.—Your obedient servant,

F. J. Dillon Lanigan.

Ballymahon, 23d August, 1867.

Longevity in Norway.—The latest Norwegian census shows that there are in that country eighteen persons above 100 years of age, one of whom, an unmarried woman, living at Mo, in the Nordland district, is 107. There are besides thirty persons of 100 years old, of whom eleven live in that same district.

Gleanings.

Losses in the War of 1866.—The number of the *Journal of the Royal Statistical Office*, just published at Berlin gives the first official report that has been published of the losses of the Prussian army in the last war. According to this report, the effective strength of the army brought into the field by Prussia and her allies was 437,262 men (including 129 generals, and 8964 officers), and 110,192 horses. The total number of the wounded was 669 officers, and 15,508 men; of those who remained on the field, 178 officers and 2753 men; of those who died of their wounds, 64 officers and 1435 men; and of those who died of illnesses contracted during the campaign, 53 officers and 6734 men. The total loss amounts to 315 officers, 10,562 men, and 6490 horses. The number of officers wounded was relatively twice as great as that of the private soldiers.—*Pall Mall Gazette.*

Spiders.—There is a genus of small spiders in the tropics which feed on ants, and they are exactly like ants themselves, which, no doubt, gives them more opportunity of seizing their prey; and Mr. Bates found on the Amazon a species of mantis which exactly resembled the white ants which it had fed upon, as well as several species of crickets (scaphura), which resembled in a wonderful manner different sand-wasps of large size, which are constantly on the search for crickets to provision their nests with. Perhaps the most extraordinary of all is the large caterpillar mentioned by Mr. Bates, which startled him by its close resemblance to a small snake. The first three segments behind the head were dilatable at the will of the insect, and had on each side a large black pupillated spot, which resembled the eye of the reptile. Moreover, it resembled a poisonous viper, not a harmless species of snake, as was proved by the imitation of keeled scales on the crown produced by the recumbent feet, as the caterpillar threw itself backward! The attitudes of many of the tropical spiders are most extraordinary and deceptive, but little attention has been paid to them. They often mimic other insects, and some, Mr. Bates assures us, are exactly like flower-buds, and take their station in the axils of leaves, where they remain motionless waiting for their prey.—*Westminster Review.*

The Language of Belgium.—The truth is that Belgium has two indigenous languages. Speaking roughly, if you draw a line across the map from about Lille to Liège, the indigenous language south of the line is Wallon, an old form of French, but one which you cannot understand although you may understand French; and north of the line the indigenous language is what they very properly call, not Flemish, but Le Néerlandais—Netherlandish. I say they very properly call it by this name, because it is the same language, with only dialectic differences, as that spoken in Holland, which we ordinarily call Dutch. This Netherlandish is a form of German' and deserves an Englishman's notice, especially because it forms a stepping-stone half way between the modern High German and his own speech. For instance, *sieben* in German becomes *zeven* in Netherlandish and *seven* in English; the German *mittel* becomes successively *middel* and *middle*; the *buch* of the German is *boek* and *book*; *tag* is *day* and *day*. Such illustrations might be multiplied indefinitely. Every Belgian, then, has one or other of these two—either the Wallon or the Netherlandish—as his native language. And beyond this almost every Belgian of education, whether in the north or the south, speaks French. Indeed, in Brussels itself French seems to be the ordinary language adopted in the better classes of society; and, though the constitution distinctly forbids the establishment by law of any particular language as the vernacular, French is practically the language of the government. Farther north French does not appear to have obtained quite the same footing among the more cultivated sections of the people. I once was present in the north at a meeting of a committee consisting of one of their leading ecclesiastics, a most eminent artist, and a well-known man of letters, and I was surprised to find that they conducted their business in Netherlandish. On my remarking the circumstance to the last-named of the three, and saying that I expected that polished men would have conversed together in French, he replied that it was with them a matter of perfect indifference; sometimes they adopted one language and sometimes the other.—*The Argosy.*

The Aleutian Islands.—The whole group of islands bear evident signs of a volcanic origin, and volcanoes

are in a state of activity on several of the islands at the present time. Not only are the islands themselves rocky, but the coasts are so encompassed by breakers that the navigation among them is dangerous. The prospect on approaching any of these islands is also frightful and desolate. Black masses of lava appear to rise perpendicularly from the sea to a great elevation, the whole of each island presenting the appearance of pointed mountains lying close to each other, and some of them having their summits above the clouds. If there are plains they are stony, and the valleys are blocked up with fallen rocks. No trees grow among these *debris;* a few coarse grasses, dwarf willows, heathworts, and alders, constitute, with mosses and lichens, and a few Artic flowering plants, almost the whole of the vegetation in the southern islands. The inhabitants would indeed suffer much inconvenience from the want of food for fuel, but for the great abundance of driftwood which is continually thrown upon their shores. This, however, will not probably trouble the Yankees, who will boil their kettles on a volcano. An unsuccessful attempt was once made to plant the pine at Oonalashka. Curiously enough the northern islands enjoy the mildest climate, and a few shrubby plants are met with, as well as willowworts and heathworts. Gardens have also been formed in a few sheltered spots, where the soil is of a better quality, and cabbages, turnips, carrots, radishes, potatoes, and other esculent vegetables, have been successfully raised. The land animals which are met with on the islands are bears, wolves, beavers, ermines or martens, and land otters, but the numbers of fur-bearing animals, both at land and sea, have been much decreased by constant persecution. This is particularly the case with the sea-otter, whose skin is held in much estimation by the Chinese, with whom the Russians trade. Red, grey, brown, and black foxes are seen in great variety on the Fox Islands. The Russian navigators also mention reindeer, wild boar (?), and long-eared wild dogs, very ferocious—probably wolves. Seals and whales are abundant on the coasts, and sea-bears or lion-seals are occasionally met with. Both salmon and halibut are caught, and the latter, as off the coast of the mainland, are sometimes of an immense size. There can be no question as to the importance of the fisheries of Vancouver, British Columbia, and Artic America, if turned to proper account. The preservation of beef and mutton from South America and Australia, and of fish from distant parts of the globe are among the most interesting problems in the social economy of the day. There is no reason why we should not have that great delicacy *Thon marinee*, or prepared tunny, salmon, and other fish in tins from British Columbia, where the fish sometimes rot at the river-falls, as cheap or cheaper than sardines.—*New Monthly Magazine.*

SNAKES.—There are in tropical America a number of venomous snakes of the genus elaps, which are ornamented with brilliant colours disposed in a peculiar manner. The ground colour is generally bright red, on which are black bands of various widths and sometimes divided into two or three by yellow rings. Now, in the same country are found several genera of harmless snakes, having no affinity whatever with the above, but coloured exactly the same. For example, the poisonous elaps fulvius often occurs in guatemala with simple black bands on a coral-red ground; and in the same country is found the harmless snake pliocerus equalis, coloured and banded in identically the same manner. A variety of elaps corallinus has the black bands narrowly bordered with yellow on the same red ground colour, and a harmless snake, homalocranium semicinctum, has exactly the same markings, and both are found in Mexico. The deadily elaps lemniscatus has the black bands very broad, and each of them divided into three by narrow yellow rings; and this again is exactly copied by a harmless snake, pliocerus elapoides, which is found along with its model in Mexico. But more remarkable still, there is in South America a third group of snakes, the genus oxyrhopus, doubtfully venomous, and having no immediate affinity with either of the preceding, which has also the same curious distribution of colours, namely, variously disposed rings of red, yellow, and black; and there are some cases in which species of all three of these groups similarly marked inhabit the same district. For example, in elaps hemiprichii the ground colour appears to be black, with alternations of two narrow yellow bands and a broader red one; and of this pattern again we have an exact double in oxyrhopus formosus, both being found in many localities of tropical South America. What adds much to the extraordinary character of these resemblances is the fact, that nowhere in the world but in America are there any snakes at all which have this style of colouring. Dr. Gunther, of the British Museum, who has kindly furnished the details here referred to, assures us that this is the case; and that red, black, and yellow rings occur together on no other snakes in the world but on elaps and the species which so closely resemble it. In all these cases, the size and form as well as the colouration, are so much alike, that none but a naturalist would distinguish the harmless from the poisonous species.—*Westminster Review.*

Medical News.

THE Director-General presents his compliments to the Editor of the MEDICAL PRESS AND CIRCULAR, and begs he will be good enough to publish the enclosed List of Candidates for Her Majesty's British Medical Service, who were successful at the competitive examination, held at Chelsea Hospital in August 1867.—Army Medical Department, 22nd August, 1867.

Maximum number of marks obtainable, 3400. Minimum required to pass, 1034.

J. L. Corbett, 2390; R. de E. C. Corbett, 2357; H. K. Maclachlan, 2297; C. F. Pollock, 2245; W. H. Macnamara, 2182; R. T. Scott, 2161; D. M'Ewan, 2095; G. Hare, 2077; G. F. Sankey, 2054; R. A. Cuthbertson, 2047; T. A. J. Cocksedge, 2039; *Count* C. Wollowicz, 2036; F. Lyons, 2022; J. G. Randall, 1967; R. Macmullan, 1876; Mark Anthony, 1870; M. M. Gallwey, 1840; G. W. Barroll, 1796; T. H. M. Clarke, 1795; S. K. Cotter, 1778; J. Barry, 1755; J. R. Leake, 1712; J. H. Hunter, 1694; H. Morgan, 1694; J. Riddick, 1682; W. F. Bennett, 1676; D. H. B. Anderson, 1640; J. A. Anderson, 1616; G. A. Rae, 1610; F. G. Steward, 1595; J. D. Gumming, 1578; E. Fitzgerald, 1550, J. D. Crowe, 1545; J. J. O'Grady, 1517; W. O. Wilson, 1514; G. Shaw, 1508; H. Jagœ, 1460; R. Morgan, 1402; D. H. W. Heather, 1395; R. F. Maunsell, 1370; J. H. Waylen, 1340; T. Kingston, 1313; G. L. Popham, 1294; A. Anderson, 1213.

THE MILITARY SECRETARY, India Office, presents his compliments to the Editor of the MEDICAL PRESS AND CIRCULAR, and begs to enclose a list of the candidates for Her Majesty's Indian Medical Service, who were successful at the competitive examination at Chelsea in February, 1867, and who have undergone a course of instruction at the Army Medical School, together with the total number of marks obtained at the examinations at Chelsea and at Netley.—India Office, 22nd August, 1867.

Maximum.....6900. Minimum.....2200.

W. Macrae, Aberdeen, 5893; H. Summerhaye's, London, 5080; G. A. Maconachie, Aberdeen, 4833; R. Aldren, Edinburgh, 4645; T. J. M'Gann, Edinburgh, Dublin, 4520; G. Bainbridge, England, 4463; J. Arnott, Glasgow, 4223; R. H. Batty, London, Ireland, 4183; W. F. Knapp, London, 4158; J. H. Ritchie, Ireland, 4065; A. J. Legatt, London, 4005; H. De Talham, London, 3968; J. Shillito, London, St. Andrew's, 3965; J. Smith, Edinburgh, 3710; J. M'Alister, Glasgow, 3695; D. A. Kerr, Aberdeen, 3405; A. L. Hackett, Edinburgh, 3360; J. R. C. Lowry, Dublin, 3310; D, B. Long, Edinburgh, 3200; H. J. Hazlett, Ireland, 3198; D. R. Thompson, Madras, St. Andrews, 3105; R. V. Power, Ireland, Edinburgh, 3100; S. B. Haliday, London, Edinburgh, 2705; A. M'Clorg, Dublin, 2625; B. Keelan, Ireland, 2295.

A Correspondent of the *Times* draws attention to the frightful pollution of the Thames at Windsor, Oxford, and Thames Ditton. The effluvium arising from the sewers at these places, whilst emptying themselves into the river, is most fearful. He says that no alteration or improvement has taken place since his visit last year. Another correspondent of the same paper remonstrates with the Thames Police authorities for allowing so many carcases of putrid dogs to remain in the stream.

An inquest was held on the 16th inst., at Leicester, on the body of a child who was poisoned by having laudanum administered to him instead of tincture of rhubarb, the mistake having been made by a shopkeeper who sells grocery and a few drugs. On discovering his mistake, instead of promptly calling in medical aid, he ordered the child a powder and a little antimony wine. A doctor was subsequently summoned; but his efforts were of no avail. The child died in the course of the evening. The jury returned a verdict of "Manslaughter."

ACCIDENTAL PROPAGATION OF SYPHILIS.—Glass-blowing may be very dangerous in this respect. The tube, passing from mouth to mouth, has been found, in the glass-houses of Lyons, to have conveyed the disease. It is, therefore to be wished, that mouth-pieces, given to each workman, and easily adapted to the tube, may prevent such sad results. A very good idea of the mode of using the tube may be formed by examining a picture exhibited in the gallery of the Crystal Palace.

WILL.—The will of Sir William Lawrence, F.R.C.S,, F.R.S., Serjeant-Surgeon to the Queen, and late principal surgeon to St. Bartholomew's Hospital, was proved in the London Court on the 1st inst., by his son, Sir John James Trevor Lawrence, Bart., the sole acting executor; power being reserved to his two naughters and to his nephew Edward John Bevir, Esq., barrister, Lincoln's-inn, the other executors and trustees. The personality was sworn under £40,000. The will is dated November 13, 1865, and there are two codicils, October, 1866, and February, 1867, and he died July 5, aged eighty-four. He has left his books, MSS., and papers equally between his son and daughters; and his jewellery, plate, pictures, horses, carriages, and furniture to his daughters, as well as his interest in his leasehold residence, Whitehall-place. He has empowered his executors and trustees to lay out his Ealing-park Estate for building purposes, and together with all his other estate, real and personal, to be held in trust; the proceeds therefrom to be divided equally between his son and two daughters, whom he appoints residuary legatees.—*City Press.*

BALLOON MEDICINE.—Dr. Chereau, the talented contributor to *L'Union Médicale*, alludes, in a very sprightly article, to recent papers published in the *Siècle*, touching the exhilarating effects of breathing oxygen in high altitudes. The author of the papers threw out the hint that various affections might be benefited by airy voyages; and M. Chereau takes this occasion of reminding his readers that, as far back as 1784, eight short months after the first ascent of Montgolfier, a candidate for the Montpellier doctor's degree, Luillier Duché, proposed in his thesis to organise regular balloon ascents for patients likely to be benefited by large inspirations of pure oxygen. Among the affections to be thus treated, he names ague, nervous complaints, icterus, dropsy, hysteria, catalepsy, epilepsy, &c.

CASES of sunstroke are reported as having occurred during the recent hot weather in different parts of England. Eight in Essex, and others in East Sussex and Margate.

SURGERY IN HERCULANEUM.—At a recent meeting of the French Academy, M. Scoutetten read a paper on some curious surgical instruments recently discovered among the ruins of Herculaneum. The most interesting of the specimens was a species of "sound," differing in few points from the instrument employed in modern surgery.

NOTICES TO CORRESPONDENTS.

Contributions should be *legibly* written, and only on one side of the paper.

When proofs are forwarded it is of the utmost importance that they should be corrected and returned without delay.

Every MS. should bear the Name and Address of the Sender.

A.B., M.D., MCh.—Received with thanks. Shall be inserted on the earliest opportunity.

Dr. Lanigan, Ballymahon.—Your note is inserted.

MEDICAL VACANCIES.

Birmingham Lying-in Hospital—Resident Surgeon.

Royal General Dispensary—Resident Medical Officer, vice Mr. Stott, deceased.

POOR LAW MEDICAL VACANCIES.

Leominster Union.—First District and the Workhouse; salary £160 per annum for the District; £40 per annum for the Workhouse.

Newbury Union.—Second district; salary £140 per annum.

Salisbury Incorporation.—Salary, £75 per annum for the District; £40 per annum for the Workhouse.

South Molton Union.—Twelfth District.

MEDICAL APPOINTMENTS.

ENGLISH.

GLYNN, T. R., M.B., has been appointed a Demonstrator of Anatomy at the Liverpool Royal Infirmary School of Medicine.

HORNIBLOW, Mr. W., has been appointed Medical Officer for the Halford District of the Shipston-on-Stour Union, vice S. Bradshaw, M.R.C.S.E., resigned.

ILIFFE, C. W., L.R.C.P. Ed., has been appointed Medical officer to the Constabulary, Wednesbury, vice H. E. Proctor, L.R.C.P.Ed., deceased.

PEARCE, F.D., M.R.C.S.E., has been appointed Medical Officer and Public Vaccinator for District No. 8 of the Kingsbridge Union, Devon, vice his father, F. D. Pearce, M.R.C.S.E., deceased.

SAUL, W. W., M.R.C.S.E., has been appointed Surgeon to the New Forest Union Workhouse, and Medical Officer to the Parishes of Lyndhurst, Minsteed, and Bramshaw, vice G. Nunn, deceased.

SPIER, Mr. E. W., has been appointed Dispenser at the Cheltenham Union Workhouse, vice Wood, resigned.

STOVIN, C.F., M.D., has been appointed Medical Officer and Public Vaccinator for the Wheatly District of the Headington Union, Oxfordshire, vice J. Cogan, M.D., resigned.

WEST, M. T., M.R.C.S.E., has been appointed Medical Officer for the Shebbear District of the Torrington Union, Devon, vice R. Rudall, F.R.C.S.E., deceased.

WHITMARSH, W.M., M.D., F.S.A., of Hounslow, has been appointed by the Lord Chancellor a Deputy Coroner for the County of Wilts.

IRISH.

FALKINER, F. J., M.B., has been appointed Surgeon to the County Gaol, Naas, Co. Kildare, and to the Poor-house, vice J. Kellett, F.R.C.S.I., deceased.

FITZPATRICK, J. P., L.K.Q.C.P.I., has been appointed Surgeon to the Constabularly at Naas, Co. Kildare, vice J. Kellett, F.R.C.S.I., deceased.

MORGAN, J., F.R.C.S.I., Professor of Anatomy to the Royal College of Surgeons, Ireland, has been appointed Surgeon to Mercer's Hospital, Dublin, vice W. Jameson, M.D., resigned.

SCOTCH.

GAVIN, W. A., M.R.C.S.E., of Strichen, has been elected President of the Northern Medical Association, Scotland.

GIBSON, W., M.D., has been appointed Surgeon to the Prison, Campbelton, Argyll.

Births, Marriages, and Deaths.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

BARKER.—On August 20, at 27, Wimpole-street, London, W., the wife of T. A. Barker, M.D., of a daughter

CHRISTISON.—On August 18, at 40, Moray-place, Edinburgh, the wife of A. Christison, M.D., Surgeon H.M. Bengal Army, of a daughter.

LEWIS.—On August 15, at 27, Dorset-place, Portman-square, the wife of F. Lewis, M.R.C.S., of a son.

MILLER.—On August 21, at 38, Bedford-place, Russell-square, the wife of C. M. M. Miller, Staff-Surgeon, of a daughter.

SEALEY.—On August 17, at Rochester, Kent, the wife of J. W. Sealey, Surgeon, R.N., of a son.

SHILLITOE.—On August 19, at Berch Mount, Sydenham, the wife of B. Shillitoe, F.R.C.S., of a son, still-born.

MARRIAGES.

BUCHAN—ROBSON.—On August 17, at St. Peter's, Newcastle, C. F. Buchan, M.D., of Pembury, Tunbridge Wells, to Amy, the eldest daughter of J. Robson, Esq., of West Chirton, Northumberland.

DOUGLAS—PANKHURST.—On August 20, at St. Bartholomew's, Sydenham, D. Morton Douglas, L.R.C.P., of Swansea, to Rosina S. Pankhurst, of Caledonian-cottage, Syhenham.

GARDINER—GRANT.—On August 19, at St. Paul's, South Kensington, W. A. Gardiner, Esq., Medical Staff, to Caroline Katherine, daughter of the late A. Grant, Esq., of Clonakilty, County Cork.

SHELDON—FAVENC.—On May 23, at Drayton, Queensland, W. Sheldon, M.D., of Tenterfield, New South Wales, to Mary Emily Charlotte, eldest daughter of P. Favenc, Esq., of Drayton, Queensland.

WATSON—SANDERSON.—On August 21, at St. Selskar Church, Wexford, Ireland, W. Watson, Surgeon, I ancaster, to Sarah Jane, second daughter of Lancelot Sanderson.

WILSON—BROWN.—On August 15, at Colton House, Fifeshire, by the Rev. James B. Brown, John Wilson, M.D., West George-street, Glasgow, to Harriet Joan Murray, second daughter of Walter Brown, Esq., W.S., of Colton.

DEATHS.

HUGGINS.—On August 14, at the Tavistock Hotel, Covent-garden (late of San Fernando, West Indies), W. Huggins, M.D., M.R.C.S.

JARVIS.—On August 12, at 13, Hart-street, Bloomsbury, John Jarvis, Surgeon, in his 92nd year.

MORLEY.—On August 14, at La Hauteur, St. Brelades (formerly of Leeds), G. Morley, M.R.C.S.E.

TURNER.—On August 17, at St. Leonard's, Torquay, (late of Grantham, and formerly Surgeon of the 7th Royal Veteran Battalion and of the 25th Regiment and 22nd Light Dragoons, &c., &c.), W Turner, M.D., in his 89th year.

NOTICE TO ADVERTISERS.

The Medical Press and Circular

OFFERS UNUSUAL ADVANTAGES

FOR the Insertion of announcements from its extensive and largely increasing circulation in each of the three divisions of the United Kingdom and the Colonies. Being also supplied to the Hospital Libraries, &c., it will be found a most valuable medium for Advertisements of Books, Vacancies and Appointments, Sales, and Transfers of Practices, Surgical Instruments, Chemicals, and Trades generally.

The scale of charges is as follows:—

Seven lines and under	£0	3s.	6d.
Per line afterwards	0	0s.	6d.
One-quarter page	1	0s.	0d.
Half ,,	1	15s.	0d.
One ,,	3	0s.	0d.

The average of words per line is twelve.

When advertisements are given for a series of insertions, a very considerable reduction from the above scale is made.

☞ Advertisements for Insertion in this Journal must be at the OFFICE, on MONDAY, by THREE o'Clock.

THE LONDON HOSPITAL AND MEDICAL COLLEGE.

THE WINTER SESSION will Commence on October 1st, when the INTRODUCTORY LECTURE will be given at 4 P.M.

The Hospital has more than 500 beds. All the Students receive Resident Appointments as In-Patient Dressers, without further payment, and all when qualified are also eligible in rotation for the Office of House-Surgeon.

The following Prizes and Appointments are open to the Students:—

A Scholarship in Human Osteology, value £20, for first year's Students only; to be awarded in January, 1868.

A Scholarship in Anatomy, Physiology, and Chemistry, for first year's Students only; to be awarded in April 1868.

The Duckworth Nelson Prize, value Ten Guineas.

A Surgical Gold Medical for Proficiency and Zeal.

A Medical Gold Medal for Proficiency and Zeal.

Three House Surgeoncies tenible for three or six months. Dresserships for In-patients and Dresserships in the Out-Patients' Room. A sum of £60 is awarded as Prizes to the most efficient in the latter department.

The Office of Resident Medical Officer (with Salary, and tenable for two years).

The Office of Assistant Resident Medical Officer (without Salary, and tenable for three months).

The Office of Resident Accoucheur (without Salary, and tenable for six months).

Two appointments as Clinical Assistants in the Medical and Patients' Room, with Salary of £40 each.

All the Resident Officers are provided with board.

The Hospital has Special Departments for Diseases of Women, Syphilis, Diseases of the Eye, Diseases of the Skin, and Diseases of the Ear.

A Prospectus giving details may be obtained on application at the College, Mile End Road, or to Mr. HUTCHINSON, Dean of the College, 4, Finsbury Circus.

ST. BARTHOLOMEW'S HOSPITAL MEDICAL COLLEGE.

WINTER SESSION, 1867.

THE INTRODUCTORY LECTURE will be given by Dr. ODLING, F.R.S., on TUESDAY, OCTOBER 1st, at Five P.M.

COLLEGIATE ESTABLISHMENT.

Students can reside within the Hospital Walls, subject to the College Regulations.

Further information may be obtained from Mr. THOMAS SMITH and Mr. CALLENDER, and at the Museum or Library.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

FIRST, OR PRIMARY PROFESSIONAL EXAMINATION FOR THE LICENCE. The next Examination will commence on Tuesday, October 1st. Students are admitted to this Examination after the termination of the Second Winter Session of Professional Study at a recognised Medical School.

SECOND, OR PASS EXAMINATION FOR THE LICENCE. The next Examination will commence on Tuesday, October 8th. Gentlemen who have completed Four Years of Professional Study, according to the College regulations, are eligible for admission to this Examination.

Registered Medical Practitioners, qualified before January 1861, are admitted to Examination under special Bye-Law.

Candidates are required to give fourteen days notice in writing to the Registrar of the College, with whom all Certificates and Testimonials required by the Bye-Laws are to be left at the same time.

Pall Mall East, 1867. H. A. PITMAN, M.D., Registrar.

Special Notice.

THE COMPANY'S FINANCIAL YEAR CLOSES ON 31ST AUGUST, AND ALL POLICIES EFFECTED PRIOR TO THAT DATE WILL BE ENTITLED TO A FULL ADDITIONAL YEAR'S BONUS OVER LATER ENTRANTS.

EDINBURGH LIFE ASSURANCE COMPANY.

ESTABLISHED 1823.

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.

HEAD OFFICE—22, GEORGE'S-STREET, EDINBURGH.

LONDON, 11, KING WILLIAM-STREET, E.C.

Invested Funds . . . . £980,688 9s. 3d.

DISTRIBUTION OF PROFITS.

Nine-tenths, or Ninety per cent. of the Profits, are divided every Seven Years among the Participating Policy-holders.

Policies of Five Years' duration becoming claims between one Division of Profits and another are entitled to an Intermediate Bonus.

The NEXT DIVISION will be made at 31st AUGUST, 1870.

EXAMPLES OF BONUS ADDITIONS
PAID PREVIOUS TO 31ST AUG. 1866.

Age at Assuring.	Sum Assured.	Bonus Additions.	Total Paid.
30	£200	£145 10	£345 10
35	900	782 10	1682 10
40	500	476 0	976 0
45	1000	1144 1	2144 1
50	999	2208 7	3207 7
60	300	822 13	1122 13

Forms of Proposals, Copies of Prospectus, and all information, may be obtained at the Offices of the Company, or from any of the Agents throughout the United Kingdom.

D. MACLAGAN, *Manager.*
WM. DICKSON, *Secretary.*

DUBLIN OFFICE:
55, UPPER SACKVILLE-STREET.
Resident Secretary—JAMES GRANT, Esq.

LONDON NURSES' INSTITUTE, 42, South Audley-street, Grosvenor-square, W.

TRAINED NURSES (Medical, Surgical, Mental, and Monthly), can at all times be obtained from this Institute.

Hospital Appointments by special arrangement.

Letters and Telegrams should convey the nature of the case to be attended.

Apply to the Manager or Matron. T. HAMILTON, Manager.

WOODHALL Spa and Hotel, near Horncastle, Lincolnshire.—This well-known Mineral Spa, which has been for many years highly recommended by the Faculty for the cure of Strumous Complaints, Tumours of various kinds, Rheumatism, Gout, Epilepsy, and Specific Constitutional Diseases, especially those of the Skin, is now in first-rate order. The Hotel replete with every comfort, and the charges moderate. Hot, cold, shower, and hip-baths always ready. This Spa contains more Bromine and Iodine than any known water; and its curative powers are unsurpassed.

The Woodhall Spa Station of the Great Northern Railway closely adjoins the beautiful grounds of the Hotel. The water will be supplied bottled, or in jars, on application to the Bath-man.

June 1, 1867.

LECTURES ON

Experimental and Practical Medicine. By BENJAMIN W. RICHARDSON, M.A., M.D., F.R.C.P.

Dr. Richardson delivers a lecture on Experimental and Practical Medicine on the first Tuesday of every month (except during the months of July, August, and September), at the Laboratory, 12, Hinde-street, Manchester-square, W. The lecture hour is from 4.30 to 5.30 P.M.

The Lectures treat on such new subjects in the advance of medicine as admit of demonstration and of useful application in daily practice; but they in no way interfere with the systematic teachings of the Medical Schools, and Students of any school may enter for the Course.

Fee for the annual Course of Nine Lectures, with certificate of attendance if wished, £5 5s.

The Course will recommence on the 4th of October.

Applications for admission are to be made to Mr. John Skinner, 12, Hinde-street, W.

Apothecaries' Hall of Ireland, 40 Mary- street. The following new Medicines and Preparations are manufactured in the Laboratory on the premises, and a supply constantly on hand:—

THE NEW PREPARATIONS OF THE PHARMACOPŒIA, 1867.

TICHBORNE'S VESICATING COLLODION.

Dr. Richardson's Styptic Colloid; Syrup of Phosphate of Iron, Quina, and Strychnia; Chlorate of Quina; Perchloric Acid; Carbolic Acid, pure and crude (the latter free from Sulphuretted Hydrogen).

Lecture.

CLINICAL LECTURE ON CASES OF SO-CALLED HYSTERICAL DISEASE.

By C. HANDFIELD JONES, M.B.Cantab., F.R.S.
PHYSICIAN TO ST MARY'S HOSPITAL.

THERE are few questions in medicine more truly practical, or with respect to which more vagueness of thought prevails, than that which is often presented to us in the case of very many so-called hysterical disorders. I think we may profitably occupy this lecture in an attempt to attain some precision in our ideas on this subject. We should never employ a term without being fully aware of what we mean by it, and taking care that our hearers are aware also; unless, indeed, we use it in a vague manner for mere convenience sake, and understand, and are understood to be doing so. Thus, there is no objection to our using the terms hemiplegia, paraplegia, and apoplexy, provided we do not mislead ourselves or others into supposing that thereby we affirm anything relative to the nature and causation of these disorders.

It will be well, I think, if we commence by a resumè of the opinions held by some of the best authorities respecting the essential nature of hysteria. Sir Thomas Watson, with characteristic wisdom abstains from offering an exact definition, but sets forth, in graphic descriptions, the chief features of the malady in its various manifestations. We cannot but gather from his pages, that he holds undue mobility and excitability of the nervous system generally on the one hand, and an ill-regulated, "deceitful, preverse" mind on the other, to constitute the essential factors of the various phases of this "pathological Proteus." Dr. Prout's opinion may best be expressed in his own words, which no doubt convey his actual experience—"In investigating hysteric cases, we should constantly remember that the utmost duplicity and cunning may be displayed, where from mere appearances we should expect nothing but the most rigid truth, in short that the whole energies of the patient's mind are bent on deception." The cause which gives rise to this mental state, Prout believes to be the natural desire of being an object of attention when it is disappointed in its legitimate form, and perverted into a craving for pity and commiseration. He lays evidently most stress on the peculiar mental condition, and as is shown in a case, which he gives in a note, believes that this disorder may hold sway in persons whom no one would ever have suspected of yielding to it. Sir B. Brodie (Local Nervous Affections, p. 75), says, "These symptons (of hysteria) are especially called into existence, whenever from any cause the bodily powers are reduced below the ordinary standard; and it is reasonable to suppose that an opposite effect will be produced by whatever tend to elevate these powers, and maintain the general health." Dr. Copeland seems to regard the malady more as an ordinary physical, than a mentally originated one. He remarks—"that more or less susceptibility, original or acquired, characterises the state of the nervous system in hysterical persons will not be disputed; yet even in such persons the usual exciting causes, or imitations of different viscera, will not occasion true hysterical symptoms, unless they previously affect the state of organic nervous influence or of circulation in the sexual organs." He also states, however—"that he has no doubt of the fit being often renewed at pleasure, almost as readily as tears may be shed by recalling or adverting to various feelings, emotions, or circumstances, and he has even seen instances which have convinced him of the fact." Romberg seems to regard increased reflex excitability as the leading characteristic of hysteria, and next to this a peculiar physical condition, the main feature of which is indecision. He agrees with older writers in considering the uterus as the chief focus of reflex irritation, and has "seen numerous instances demonstrating the futility of all remedies, while this focus of hysteria if existing is over-looked." He states also, however, that he has obtained permanent cures of inveterate hysteria, by the prolonged use of chalybeate waters, in erethetic conditions by whey baths, and those of Schlangenbad, and where there are symptoms of gastric and hepatic derangement by suitable remedies, among which he includes the Marienbad, Kissingen, and Ems waters. Moral treatment, he rates so highly, that he says without attending to it we shall fail in other attempts at cure. On the whole, he seems to regard the malady as one in which physical derangement plays the principal part, and while admitting fully the deceitfulness of the hysterical, he does not view the manifold symptoms they exhibit as mere malingering. Dr. Conolly admitting that the disordered state of the nervous system may very frequently be induced by uterine irritation, affirms that it no less evidently arises in other cases from causes productive of irritation in other parts of the body, and also from causes acting directly upon the mind. Mr. Carter regards the convulsive paroxysm as the essential characteristic of the disease, and speaks of it as involuntary, and in the first instance solely the result of emotion. Tertiary hysteria, which he makes invariably to orginate from the paroxysm, he designates the self-produced disease, and considers the actors of its manifold scenes as nothing less than impostors and malingerers. He shows, I think plainly, that the convulsive paroxysm may occur in persons who are by no means of a peculiar mobile temperament, as the effect solely of powerful emotion, but he admits the influence of various states of constitutional debility, which diminish the power of resisting emotional excitement. With him hysteria is much more an affair of mind than of body, and in his admirable chapter upon treatment (which every practitioner should read), he plainly shows that he sets little store by drugs as means of opposing hysteria. Dr. Carpenter assents to Mr. Carter's general statement, that hysteria is essentially a manifestation of emotional excitement, *not depending* upon any local affection, though liable to be *modified in its symptoms* by the condition of particular organs. He evidently holds that the will, though strongly exerted to repress morbid manifestations, may ultimately fail to do so where the emotional part of the character is very active. He views with favour the opinion of Dr. Laycock, that certain diathesis, especially the gouty, may give rise to the hysteric paroxysms or to anomalous hysteric disease. The two last-named writers admit a considerable influence of physical, or, at least, involuntary disorder in the production of the malady. Hasse writes, the origin of hysteria depends on the combination of different causes which may, according to circumstances, prove of different efficacy either in the way of predisposing to, or exciting the appearance of the malady. He enumerates the principal causative conditions as follows:—Increased sensitiveness of the peripheral nerves, increased reflex excitability of the spinal cord, increased receptivity of the brain for sensory impressions, and a certain psychical tendency, which conditionates a helpless (will-less) yielding to external influences, and a diminution of the mental supremacy over involuntary nervous excitement; lastly, the presence of local bodily irritations, or adequate psychical influences. Here there is certainly a good deal admitted in favour of the malady being to a considerable extent of material (somatic) origin. The chief conclusion which I draw from this review of recorded experience is that no exclusive view of the nature of hysteria, using the term in its more general sense, is likely to be correct. The physical frame, and its immaterial inhabitant are both concerned, or at least may be. Which of the two takes the initiative in disorder may be a question of great difficulty, and must be determined by the circumstances of each individual case.

Before stating to you any opinion of my own on the subject before us, let me remind you of the distinction of the nervous centres so admirably laid down by Mr. Simon seventeen years ago. The convoluted surface of the cerebrum constitutes the *primary* centre. The cerebellum, the basal ganglia (corpus striatum and optic thelamus), and

the grey nerve matter which prolongs them backwards as far as the medulla oblongata, including that of the pons and locus niger, make up the *secondary* centres. *Tertiary* centres are the grey nerve matter of the spinal cord, the ganglia of sensitive nerves, and those belonging to the special senses and special movements which exist about the mesencephalon. *Quaternary* centres are the ganglia of the sympathetic. The primary centre is undoubtedly the seat of the intellectual action. What is the seat of the emotions we cannot so precisely say, it may with much probability be assumed to be in some of the secondary centres, perhaps, as Dr. Todd suggests, in the upper and posterior part of the meso-cephale. The tertiary centres, as Mr. Simon states, are chiefly the locus in which ordinary neuralgia arises. The quaternary centres preside over the several viscera. These several centres may be combined together as they commonly are in healthy action, and often also in morbid states. It is, however, quite as common, if not more so, that one or other of them are predominantly affected. It is notorious what different effects are produced in different persons by the same cause. Thus, an eccentric irritation, as in the intestines, gives rise to chorea, epilepsy, vertigo, paralysis, convulsions. The neuralgia caused by a carious tooth, as Dr. Meryon states, may produce delirium ; and the gravid state of the uterus may give rise to hemiplegia, paraplegia, chorea, deafness, amaurosis, cerebral torpor, insanity ; in fact, to more or less profound derangement of all the superior centres. Dr. Lee records a case in which dilatation with bougies was employed to enlarge the cervical canal of the uterus. After introduction of the instrument it was observed that the patient became highly nervous, sleepless at night, had frightful dreams, and complained that there was a dark cloud hanging over her spirits. Subsequently the cervical canal was incised, and violent mania followed, after which her reason was never perfectly restored (*Lancet*, 1865, June 10th). It is tolerably certain that in all instances of this kind the phenomena are as much dependent upon weakness of the suffering centre or centres as upon the irritation conveyed to them. For one who is injuriously affected by such causes as we have just adverted to, there are many who escape, because their nerve tissue is more strongly organised, more capable of resistance. Moreover, the centre which is weak in one person may be strong in another, and then, of course, the same irritation will be attended with different results. The above considerations lead me to think it no more than reasonable that the emotional centres like the others should be disordered in their function by impressions of a morbid kind arriving from the tertiary centres. It seems to me also undeniable that they may be similarly affected by impressions transmitted from the primary centre, which is, indeed, matter of common experience, and if these impressions are sufficiently intense the excitement of the emotional centres may be for the time quite uncontrollable by the calmer action of the intellectual centres. The hysterical paroxysm is then involuntary, as is exemplified in two cases related by Mr. Carter (v. p. 29, 30).

Let us now come a little closer to the actual matter before us. First, with regard to the convulsive paroxysm. It seems to me almost, if not quite a matter of certainty, that it *may* be produced in a purely material way, either by simple failure of the nerve power of the centre from some enfeebling cause, or by impressions conveyed through afferent nerves and tertiary centres to the emotional, without the intellectual centre participating in the disorder at all. A married lady who has been under my observation for many years, and who has never presented any sign of hysteria, told me that when single she wounded her hand one day at the root of the mid-finger with a knife while cutting bread. "She sat quiet for a time, afterwards she laughed, cried, and kicked." These hysterical symptoms could not have been the effect of alarm, or they would have come on sooner, and I feel positive they were not in any the least degree manufactured from a craving for sympathy, for she has since then passed through much more suffering on several occasions without any recurrence of the like. It is very much to the purpose, that several years later she cut her thumb with broken glass, soon after she felt some degree of stiffness of the jaws, and a peculiar nervousness. She took ammonia and bark, and gradually got right. It seems not doubtful to me that the manifestations of hysteria on the first occasion were produced just in the same way as those of tetanus on the second, and I entirely disbelieve that emotion was in play on either. A gentleman, after a hard day's work, had taken a walk which fatigued him ; on reaching his destination he fainted, but recovered consciousness almost immediately. While lying on the floor, unable to rise on account of the erect posture bringing back the syncope, he had the utmost difficulty to restrain himself from bursting into a paroxysm of laughing and crying, and, after recovery, he passed a very large quantity of aqueous urine. Here the hysterical manifestations, which just became so far apparent, as to cause a bystander to mention the term, were solely dependent on bodily exhaustion, and there was not the least particle of mental or emotional disorder from first to last. Sir Ranald Martin mentions among the sequelæ of sunstroke, distressing hysterical states of the nervous system, with an absence of self-control in laughing and crying, the paroxysm being followed by great prostration of nervous power. If any one should object that emotion might still be the exciting cause of the disorder, it may be replied that its causative influence must be considered trifling compared with that of the insolation. In his clinical lectures on Disorder of the Nervous System, Dr. Todd gives a case, the 48th, the subject of which was a girl, aetat 19. She was of healthy parentage, had always lived in the country, her general health had never been very good, and three years before her admission, she had had typhus fever. The catamenia were regular, lately had been excessive. She had frequent attacks of giddiness, and was subject to great variation in her flow of spirits. Two months before her admission, paralysis of motion, and sensation of the right leg commenced, extended upwards, and afterwards involved the arm, face, and tongue. She had latterly become subject to hysterical fits of a very severe kind, these continued together with the hemiplegia, *and in one of these fits* she died, eight months from the commencement of her illness. At the autopsy, considerable softening of the left hemisphere was discovered, the result of tubercular deposit. Dr. Todd views this case as an example of the hysterical diathesis highly developed, and complicating the effects of cerebral lesion. He describes the hysterical phenomena as being of an exquisite character, to a degree which cannot be fully appreciated by those who did not see the patient. To me, as I read the case, but one conclusion seems possible, viz.—that the hysterical attacks, as well as the paralysis, were essentially owing to the cerebral lesion, and I have no doubt that both were equally and completely involuntary. Had the convulsive attacks been occasioned by emotional excitement, I can hardly believe they would have caused death. It is possible that the hysterical diathesis, which this girl, as well as her sisters possessed, gave its peculiar tone and character to the convulsions, but yet I cannot doubt they were as much of physical origin as those which ensue occasionally in cases of cerebral hæmorrhage, and are like those in this case on the same side as the cerebral lesion. I have included this case with the preceding, because it seems to me to illustrate the same point, viz.—the production of hysterical fits by a purely physical mechanism, although the morbid impressions which excited them proceeded from disease in the superior intellectual centre. In my Lumleian lectures, I have recorded a very similar instance, where syphilitic tubercles on the surface of the pons varolii produced paraplegia, but left the arms almost unaffected.

(To be continued).

A petition has been presented to the French Senate asking that all mothers be compelled to nurse their own children.

Original Communications.

ON THE ALLEGED ANTICIPATION OF ACUPRESSURE BY JOHN DE VIGO.

By Sir J. Y. SIMPSON, Bart., M.D., D.C.L., Etc.

Some eight years ago, the idea of arresting hæmorrhage by acupressure first occurred to my mind, and I worked out different methods of applying it. Subsequently, when writing on the subject, I made a somewhat extensive search through such surgical literature as I had access to, with the view of finding out whether the same hæmostatic principle had been previously proposed or not. I entered on the literary part of the inquiry fully believing that such a very simple and efficient mode of staying the bleeding accompanying surgical wounds and operations would, in all likelihood, have been suggested by some surgical authority or another, and I was surprised rather than otherwise to find no trace of it whatever in the past records of practical surgery; for it is confessedly rare that we have ever, in modern days, operations or plans of practice adduced—and much less any great general principle of treatment, such as acupressure—without being able to discover some more or less distinct notices of them in antecedent times.

In the Medical Press and Circular however, it has been stated that long ago (or about 1516) the famous Italian surgeon, John de Vigo, has described *one* out of the various modes of acupressure; but the statement is erroneous, and arises entirely from a misinterpretation of the Latin description by John de Vigo of the tying of bleeding vessels. The statement itself occurs in the very able and eloquent address on Surgery which was delivered on the 8th of August by my friend, Professor Smith, before the late annual meeting of the British Medical Association, at Dublin.[1] In this address he adverts rather censoriously to the modern "systematic neglect of the works of the ancients," and to the consequent reproduction, in modern times, of some of their modesof treatment, operations, &c., "clothed in all the glittering charms of novelty." As "one example," and, in his own words, "a *most remarkable one*," he cites John de Vigo as having described the arrestment of hæmorrhage by acupressure. Professor Smith places John de Vigo in the seventeenth instead of the early part of the sixteenth century, and he gives his alleged account of acupressure in the following words :—

"He [John de Vigo] says it was the practice of some to tie the veins and arteries, when opened, with a needle and thread. 'Modus autem ligationis: eam aliqui efficiunt intromittendo acum sub vena, desuper filum stringendo.' Is not this the third mode of acupressure of Sir James Simpson?.....who, it is obvious, was not aware of the passage I have quoted."

I have been familiar for some time with this passage concerning hæmorrhage in John De Vigo's writings. But the passage assuredly refers to the ligature of vessels, and not to their acupressure.

The words as cited by Professor Smith are taken by him at second-hand from Portal (see his History of Anatomy and Surgery), who gives them in a somewhat abridged and mutilated form. If Professor Smith had referred, as perhaps he ought to have done in such a case as this, to the original work of John de Vigo, he would have found him (in his Liber de Vulneribus) describing two modes of securing bleeding vessels (in the chapter "De fluxu sanguinis et de ejus cura"), in the following words :—

"Necessarium est aliquando ligare venam presertim arteriam quia ipsa ligata locus a facili incarnatur remedio. Modus autem ligationis earum aliquando efficitur intromittendo acum sub vena desuper filum stringendo cum facilitate aut ligetur vena ipsam excoriando deinde in superiori capite cum filo optime stringatur."—(Opera Domini Joannis de Vigo in Chyrurgia 1525, liber iii., tractatus i., caput 2).

In order to understand these directions we must remember that till the time of Ambrose Paré (half a century after the time of John de Vigo) the arteries in amputations were never tied, but were always cauterised and burned.[1] Arteries and veins, however, laid open in accidental and slight surgical wounds, were sometimes attempted to be ligatured in the way described in these words of John de Vigo. The latter of the two modes which he speaks of as being used by some surgeons, consisted in exposing or dissecting out (*excoriando*) the upper orifice of the bleeding vessel, and tying it with a ligature. The other mode consisted in passing a threaded needle under the vessel, and tying or ligaturing the vessel with the thread thus introduced. But the needle was used merely as a means of carrying or passing the thread around the vessel, the thread being left as the compressing agent, and the needle at once removed.

To comprehend this point better, let me observe, before Paré's time a threaded needle was often employed (where a ligature was applied at all) to place the ligature around the bleeding vessel. Paré himself describes this as one of his well-known three modes of applying the ligature in surgical wounds. And it was employed and recommended as late as the last century, under the name of "stitching,"[2] by Shaw, Sharp, Monro, Gooch, and other surgeons in this country, and by Dionis, Garengeot, Petit, Heister, &c., on the continent. John Bell, indeed, describes in his "Principles of Surgery," vol. i., p. 223 (edition of 1826), *the* "discovery which has raised Paré to a rank not inferior to that of Harvey," as the "discovery of the *needle and ligature* for stopping arteries." Paré and all his followers used for the purpose of constricting the arteries one end of this little instrument (if we may so call it)—namely, the ligature ; while they cut off the other end of it—namely, the needle—after it had drawn through the thread. Acupressure, on the other hand, consists in inverting all this ; or, in other words, in using the other portion of the instrument—namely, the needle, and in omitting the thread.

From unfortunately forgetting these well-known facts in the past history of hæmorrhage in surgery, Professor Smith has been led into the awkward mistake of imagining that John de Vigo described compression of the bleeding vessel with a needle or by acupressure, instead of that needle being merely directed by him to draw under the vessel the thread by which the vessel was to be afterwards compressed or tied.

Any person acquainted with mediæval Latinity, and with the history of surgery, can only, I believe, read John de Vigo's passage in this one way—namely, as a description, as he himself names it, of the *ligatio* of the vessel, not the mere compression of it. Formerly I showed the passage to some of our best classical scholars, in and out of the profession, as Professor Sharp, Dr. Andrew Wood, and others, who all read it as describing the ligature, and not the acupressure of bleeding vessels. It seems to me impossible to torture with any justice—the three words,

1 Dr. Syme, in proposing a vote of thanks at the Association to Professor Smith for his address, followed up the censure of the lecturer, by remarking, "He (Dr. Syme) trusted his (Professor Smith's) observations with regard to the older writers on surgery, would have their proper effect. So far as he (Dr. Syme) was concerned, he had endeavoured (!) to inculcate upon his pupils a respect for the writings of surgeons of former generations, but he was afraid that he was not so successful as he could wish."—*Freeman's Journal* of August 9, 1867.

1 It seems not generally known that Ambrose Paré himself, though using the ligature after amputations, did not use it after such operations as the excision of the cancerous mamma. In describing the extirpation of the carcinomatous mamma, he advises the resulting wound to be "seared with an actual cautery." (See his "Workes," p. 281.)

2 The most popular English work on surgery towards the end of the sixteenth and beginning of the seventeenth century was Cook's "Marrow of Chirurgery." After describing that "dreadful" operation, amputation of the limbs, he speaks of stanching the resulting hæmorrhage by (1.) potential caustics, and (2.) actual cauteries. "The third way," he contemptuously adds "is by *stiching*, which is almost wholly rejected. See Paræus for the manner," (4th edition, p. 203.) After removal of the cancerous mamius, "the mouths (say Shaw) of the larger vessels are to be *stiched* or sewed up." (New Practice of Physic, 1745, vol. ii., p. 633.) The first Professor Monro tells us that in Edinburgh, in 1747, in amputations, "the most common practice is now to *stich* the vessels." (Edinburgh Medical Essays, vol. iv., p. 262.)

"*desuper filum stringendo,*" (tying the thread above), into tying the needle in *with* the thread ; for if that had been the meaning of the author, he would have written "filum," not in the accusative, but in the ablative.

But can we not arrive at De Vigo's meaning, by tracing the mode in which his pupils or cotemporaries tyed the vessels in wounds such as he alludes to.

Mariano Sancto—one of the most distinguished disciples of John de Vigo—has described in 1543, the method of taking up a bleeding vessel in accordance, apparently, with the principle and teaching of his master. In detailing how he secured a bleeding vein or vessel in a wound of the wrist or forearm—which had defied the efforts of other practitioners—he tells us that first he transfixed the lip of the wound above from one side with a needle down to the cut vein, which he left untouched ; the needle was then passed under the vein upwards and outwards again to the surface. In this way, says he, a loop or noose of thread or string was formed around the cut vein ; and, by firmly tying the ends of this string together, the vein and the lip of the wound were constricted.[1]

Another celebrated Italian surgeon of that day (1553) —Alphonsio Ferri—in speaking of the snaring *(illaqueatio)* of a bleeding vein or artery, recommends the vessel to be surrounded with a thread, and the two ends of the thread tightly tied together ; and he advises the thread to be carried under or around the vessel with a long curved needle. (See his work "De Sclopetorum sive Archibusorum Vulneribus," lib. ii. cap. 5.)

In John de Vigo's original Latin there is little punctuation, as Latin works in his day were printed without minor points. Professor Smith, in citing the passage as given by Portal, places a comma where De Vigo and Portal have none—namely, after "*vena.*" Probably, if a point should be inserted at all, it should be after "*desuper,*" which would then indicate the direction of the needle, and not the direction of the thread.

But we have a form of evidence of, if possible, a still more conclusive and incontrovertible kind that Professor Smith's interpretation is wrong. For we can appeal to the reading of the debated passage by the various translators of John de Vigo's works, who were necessarily familiar with his style. His works were translated into English in 1550, by Bartholome Traheron, and published as "The most excellent Workes of Chirurgerie made and set foorthe by Maister John Vigon, Head Chirurgeon of our tyme in Italie ;" and this translation was republished in 1571 and 1586. In the "Considerations in Emorosagia," the translator renders into old English the Latin passage under discussion in the following words :—"Sometimes also it is necessaries to tye the veine, and chiefely the arterie. For when it is tyed the place is soone incarned. The maner to tye it is as followeth. You must put a nedle under the veine with a cered thred, and draw it [*filum*] together softly, or else ye shall bynd the veine above, and tye the mouth with a thread." (Folio 135.)

In his well-known "Apologie," Ambrose Paré cites various surgeons and authors who had described the tying of arteries with ligature before his use of it in amputation. Amongst others he states, in allusion to the preceding passage of John de Vigo, that "John de Vigo, treating of a hemorragie in bleeding wounds, commands to *tye* the veine and the artery." (See his "Works," p. 1134.)

As I have already stated, Professor Smith has drawn his quotation of the words of John de Vigo, not from the original works of that author, but from an imperfect citation of the passage in dispute, given by Portal in his "Histoire de l'Anatomie et de la Chirurgie." Portal translates into French the passages cited by Professor Smith. He observes that it does not appear that John de Vigo had himself tried the ligature, but "Quelques-uns, dit-il, sont dans l'usage de lier les veines et les arterea ouvertes avec une aiguille garnied d'un fil, avec lequel ils resserent les parois du vaisseau." (Tom. i., p. 264.)

Of course it is almost unnecessary to observe that Portal translates the passage as meaning that the "lequel" which compressed the walls of the vessel was the thread or "fil," and not the "aiguille" or needle, or he would have written it "laquelle."

Further, if Professor Smith had read even Portal's observations correctly, he would have found him arguing in the same page that this description of the ligature of bleeding arteries with threads was as precise as anything that Ambrose Paré himself had written regarding deligation, and that hence the "*gloire*" of the invention of the ligature of arteries should be attributed to John de Vigo,—forgetting, however, as Portal here strangely did, that Paré had himself cited Galen, Celsus, Avicenna, Guy de Chauliac, Hollier, Tagaultius, Calmetheus, Vesalius, &c., as well as John de Vigo, as antecedent writers who had all mentioned the ligature of bleeding arteries and veins. In addition to this list, Dr. Adams (see his edition of "Paulus Ægineta,") cites Ætins, Paulus Ægineta, Palludius, Albucasis, Averrhoes, Rhases, Haly Abbas, Brunus, Theoderick, Rolandus, and Laufrac—as all ancient authors who describe the ligature of vessels.

Full translations of John de Vigo's Latin work have been published in the German and Italian languages.

For copies of the translations of the preceding paragraph in these French and Italian translations, I am indebted to the kindness of Dr. M'Gavan, of Paris, and Dr. Eastlake, of London, who have found these translations in the libraries near them. Both translations describe the tying of the vessels by the *thread* as the mode of closure ; and, like Portal and Trahernon, they do include the needle as in any way being an agent in the constriction of the artery or vein.

While thus showing that my friend, Professor Smith, has inadvertently, but entirely, mistaken and mistranslated the language of John de Vigo when he thought that that ancient author has described one form of acupressure, let me here add that it is quite possible, and indeed probable, that the use of the needle as a hæmostatic agent in surgical operations and wounds may yet be found in the past literature of surgery ; but I repeat, I have hitherto searched in vain for any such notice. Others may be more fortunate in the pursuit, and I for one shall not regret any success they may have in this inquiry.

In my work on Acupressure (1864) I have only alluded to John de Vigo's observations on hæmorrhage as placing him in the list of those who had spoken of the ligature of vessels before the days of Paré. At one time I thought of citing the passage itself brought forward by Professor Smith, with the view of guarding against that misinterpretation of it into which Professor Smith has fallen ; and I now regret that I had not done so. But I was advised that the interpretation was too evident to be likely to lead any one into error; and, besides, my book was unfortunately becoming far too large and long without any such discussions.

1 "Transfixi labrum vulneris acu in parte superiori usque ad venam incisam, eamque intactam reu reliqui, ex una parte. Deinde eandem acum deduxi sub ipsam venam ad partem alteram, et iterum labrum ex infera ad superam partem transfixi, ita quod laqueum incisæ venæ composuimus, cujus capita benè nectendo venam cum labro colligavimus." (See the "Compendium in Chirurgia" of Mariano Sancto in Gesner's 'Scriptores Veteres," fol. 161.)

SURGICAL COMMENTARIES:

INTENDED AS A DIGEST OF THE AUTHOR'S PRINCIPLES AND PRACTICE, AS ILLUSTRATED BY THE MORE IMPORTANT SUBJECTS OF SURGERY.

By GEORGE MACILWAIN, F.R.C.S., Etc.

AUTHOR OF "MEDICINE AND SURGERY, ONE INDUCTIVE SCIENCE;" "THE UNITY OF THE BODY;" "DISEASES OF THE MUCOUS CANALS OF THE BODY;" "STRANGULATED HERNIA;" "LIFE OF ABERNETHY," AND OTHER WORKS.

NO. IV.—DEFINITION OF FEVER CONCLUDED.

In the last paper I gave a very brief sketch of a few of the principal points whence, in different fevers, I deduced what I believed to be the only characters *common* to all fevers. I might have been induced to have added to them

certain actions of the skin as essentially connected with the subsidence of fever, from its *all but* universal occurrence. But this would have been unsafe, just as it would have been to have included the black tips of our old pens as common character, because there was only one quill without it amongst them. If you include as a common character one that is not so, there is no saying how far you may be led from a true view of the subject; leaving it doubtful may, it is true, withhold something from you, but it does not necessarily give you anything that is false. I therefore did not include in *that form* the actions of the skin. Had I done so it would very conceivably have led to restricted views, and have left unappreciated, occurrences which occasionally characterise the subsidence of fever and are the so-called "critical."

I will now state some other conclusions to which the analysis led me, and add such arguments as I have space for in support of them.

Prop. 1. Fever is essentially the result of two forces, *ordinarily* represented by *one* derived from *without*, the other from *within*, the latter being a definite, but, in different cases, *varying* condition of the body. That the phenomena result from the resistance of the body (no matter whether we call it reparative or by any other name) to an injurious influence *under circumstances of interference.* That the condition of the body constituting this interference is in general ascertainable, the common character being a minus condition of natural power, or force. I am not aware that the first proposition can be disputed, because it simply, in fact, affirms that there is some condition of body which is essential to the occurrence of fever. Nor is it inconsistent with the assertion that there are the two elements, if I admit that either may be *exceptionally* in such force as to constitute at once the disturbance from without and subductor of natural powers from within. Still, such instances are extremely rare, if they can be really said to exist, and can be inferred only from rare examples of plague or fevers of similar intensity, and from intensely severe injuries in the practice of surgery. But the rarity of such cases may be again inferred, and the actual existence of them doubted, from the fact that in certain cases, both in the history of plague and other epidemics, and certain cases which occur in the practice of surgery, examples are not wanting where intensely severe injuries, which leave a considerable interval, say many hours, between the infliction and the fatal issue, are not attended *by any fever*, nor by any phenomena denoting *attempts at repair*, or other reaction, as the case may be, on the injury in question. I must not allow the reader to mistake the meaning of "minus power," so as to infer that I mean what is usually understood by the term weakness or want of power. I do not mean that the power is not existing, but that something impedes its full exercise, and that the removal of this impediment is the thing required. Unless I make this clear, I shall be in danger of merging all fever in mere weakness, and all treatment in the use of stimuli—which would be as absurd as dangerous.

Prop. 2. That the condition of body referred to in the former proposition, is no vague state, usually expressed by the term predisposition, though, no doubt, it involves that idea, but a condition in which the organs of the body, beside the general disturbance in which all may participate, and exclusive of organic disease (which, of course, may or may not be present), are in an unnatural or unhealthy relation to each other. That this condition cannot be deduced from the symptoms, because the symptoms may be in one organ, whilst the cause of the condition is in another. The evidence required is to be deduced by a careful ascertainment, so far as that is possible, of the previous history of the patient, and the various injurious influences to which he may have been *at any time* exposed.

I regard the foregoing as the most important question in the whole subject of fever, and I am convinced that if we ever are to really improve our power over the infinitely varied disturbances comprised in the term fever, it must be from the working out more fully the problem it involves. I do not deny that it is in many cases intensely difficult. I do not deny that in some cases, from the late period at which the case may be seen, or other circumstances, it may be impossible, but I am convinced that in many other cases it is very easy, and that even in these it is too commonly neglected. In compliance with a prevailing conventionalism, it may be asked—"What right have you as a surgeon to discuss a subject so much in the province of a physician." I reply that whilst the practice of medicine shows nothing to which we cannot on this subject produce parallels in surgery, we can, in the practice of surgery, observe relations which are seldom, if ever, so clearly demonstrated in the practice of medicine, especially if we regard as common property that most instructive disease small-pox. We can see in surgery where a clean puncture by a needle is followed by fever, erysipelas and death, in one case, and where it produces nothing more than a scarcely observable disturbance for a few minutes in another. We can multiply these extreme phenomena by others of intermediate and varying intensities of sequence in almost all accidents and injuries which happen to the body, where the approach to absolute identity of the external force is such as to render it impossible to demonstrate any difference in *that* element of the disturbance.

The phenomena of intermittents may be examined in surgery unobserved by any such obscure external forces as marsh, miasma, &c., and with the discovery that an intermittent may be readily induced by the contact of a foreign body with a mucous canal in one case, and as certainly prevented by previous attention to the state of the body in another.

We learn also, in surgery, to avoid regarding as entities phenomena which are simply common characteristics of failing power, and merely culminations of antecedent conditions of disturbance, of multiform variety; and thus we avoid a barbarous nomenclature, such as typhus, typhoid, &c., or only employ it under a kind of conventional necessity, from a poverty of nomenclature, as designative of declining or exhausted power. Phenomena observable in the practice of surgery, not unfrequently supply us with means of testing the nature and influence of various conditions of the body, which have all the force of crucial experiments. Surgery also shows, by emphatic examples, how greatly modified all influences from without, whether accidents or operations, are as to the *kind* and *degree* of fever sequent on them, by the previous condition of the body.

Few things are more instructive than the results of operations in different hands, where nothing can be reasonably ascribed to any difference in the time occupied by them, or the adroitness of the operator, but where there are often great differences as to the time, and care taken in the previous preparation of the patient.

Here is, no doubt, a field which requires more careful cultivation. Even in situations where it is impossible to obtain a reasonable approximation to external circumstances, as cleanliness, pure air, and so forth, but where these very disadvantages oblige you to look more analytically to the actual condition of the individual, and to such things as may be within your control; it is very interesting to see how much may be done by painstaking. During at least twenty years of my life I had, perhaps, as much experience as any surgeon in London, as to operations performed under inauspicious circumstances. Yet, by a careful attention to the previous habits of the patient, and the actual state of the different organs, I not only obtained a great deal of information as to the real dependence of different diseases which I failed to acquire from other sources, but as regards the results of operations, both immediate, and, so far as I have ever yet learned, prospective also, successes which left me little to desire.

I cannot now enlarge on this subject without anticipating certain practical matters to which the discussion will be more pertinent.

In fever the actual state of the individual can seldom be gathered from the symptoms alone. The previous history should be ascertained as accurately as possible, no pains-

taking here is superfluous, because the previous history of the patient is the most secure source, if it be not the only one whence the *special* treatment can be deduced.

The history of fevers presents us with many examples of controversy as to the treatment of particular periods.

The treatment has been sometimes extremely different and even opposite. Yet it has appeared from the allegations of different observers, that each have had their share both of success and failure. This must, according to the true nature of fever, necessarily happen ; nothing is more improbable than that anything besides that part of the treatment which applies to all fevers, should be uniformily successful, because it assumes a similarity or identity of condition in the individual which does not necessarily exist. It treats, in fact, the so-called "fever," and not the special condition of the individual. The general treatment may have been one common to all cases, by which I mean regulation of temperature, pure air, good ventilation, repose, and subdued light, and so on ; and no doubt many hundreds of cases would recover from good general treatment alone, but when any special treatment is instituted in addition, it can only be deduced with safety by the most careful inquiry, into all the circumstances affecting the previous state of the body, for in the very same epidemic, or in a fever not epidemic, where the *external signs* may designate no *marked difference*, the special treatment required may, in different cases, not only minister to different, but even *to opposite*, indications.

Again, the accurate ascertainment of the actual condition is the more important, as in all fevers, in which you may see your way to any measure specially adapted to the individual, it is essential that it should be done *as early as you can*. If in such a case you rest your general treatment on some inert conventionalism, the time will soon go by at which any special measure may be useful. Early, you may evoke a power which you can never create. That time gone by, the very same remedies may only hasten the destruction of the powers of your patient, which they might before have successfully evoked. I know of no active remedy which I have not seen thus destructive, because either misapplied as a prevailing fashion at the time, or as inopportune to the period of the case. It is not denied that there are states of system in which violent impressions may have been made on the nervous system, which may not be resolvable into any special condition of this or that organ of the body. The very acknowledgment of the power of fear and other depressing influences on the nervous system assumes such condition. Such cases occur both in what is called fever, and from all other injurious influences, including certain forms of severe mechanical or chemical injuries seen in the practice of surgery. The treatment however, in either case, special as it may be, as contrasted with the *general* treatment of fever, is strictly analogous in both, and serves to add another amongst the various evidences of the essential nature of this apparently Protean malady.

Abernethy, in his "Eventful History of a Compound Fracture," in describing the condition of certain cases which terminated badly, was wont to say that he would ask any physician from whom he concealed the occurrence of the accident, what he called the state of the patient, and that the physician would reply "decided typhus, sir ;" and so, indeed, he might, for there is no difference in the essential nature of the condition implied, and the ordinary so called typhus of the physician. I mean that a certain injurious influence has been applied, *ab extra*, to the body, to the repair of which the interferences, *ab intra*, render the vital force, or whatever name you prefer, questionable or unequal.

But the lesson which these, and many other surgical cases, teach us is, that it furnishes the investigator with a synthetical argument. For if fever be nothing more than the vital force combating an injurious influence under circumstances of interference ; why, then, if we can place the two things together, we ought to have fever ; or, on the contrary, if we can detach the interference, we ought, then, to have no fever, such as we usually intend by that term, nor any other disturbance other than a temporary excitement, so far characteristic and inseparable from actions of resistance and repair, that we never think of it as disease.

Surgery gives us this opportunity. The compound fracture in many cases furnishes a very good example, not only of fever, but in different cases, of different kinds ; but there are numerous other cases in surgery which do this equally well, though each may exemplify different phases more or less strikingly.

The mucous canals of the body are very instructive in this way. In disorders of these canals phenomena occur which contribute their light to the real nature of fever. A patient has a bougie passed, he may complain of no pain, but presently he becomes faint, and may fall down. Another has an attack of a intermittent fever as a sequence of the same apparently trifling circumstance, but I can aver, from my own experience, that the surgeon who prepares his patient will scarcely ever meet with the latter phenomena, and very rarely, indeed, with the former. Those who have resided much in warm climates are more obnoxious, it is said, to these sequences, and I am inclined to believe so, but with a very little previous preparation they may be prevented in all. I recollect an elderly gentlemen on whom, on his coming from the country, a surgeon passed an instrument, without any preparation, and it was followed by so severe an intermittent, that it had well-nigh proved fatal. The further discussion of this subject would receive additional light from the very marked influence which a really studious preparation of the body exerts on every thing which occurs where an opportunity offers, either in the practice of medicine or surgery, and which demonstrates the "oneness" as to the essential constituents of the so-called "fever." But I have no space for discussing more fully this important subject, but must refer the reader, who really desires to test the accuracy of any views at which I may have arrived, to the analysis of which I have spoken, and which was written in continuation of "Medicine and Surgery, One Inductive Science." I shall, therefore, conclude with a few remarks. No one can doubt that already many thousands have been saved by improved conduct of what may be termed the general treatment of fever. I am convinced that another very large number may be added to the recoveries from the more accurate study of the special state of the individual.

This research is the more promising, inasmuch as we have no right to infer that any epidemic influence has any power *alone* to produce fever independently of a certain, and, as the rule I believe to be, an ascertainable, condition of body. I do not say that this can always be done, or if done, it can always be corrected. As regards the treatment of the individual, the "Analysis" contends that the object should be to excite secretion in the organ which the combined evidences of history and symptoms may have induced you to regard as having been antecedent to the fever, subjected to injurious influences, always excepting where you have determined that it is labouring under structural disease. In this case it is contended that you will obtain most benefit, by inducing secretion from some organ, which you may determine to have the most concurrent function, or the most vivid sympathy with the organ you suspect to be diseased in structure. Combining your measures, so as to include or not some excitant to the suspected organ, or avoiding all excitement of it according as your conviction of organic disease is matured, or in greater or less doubt. Some matters of treatment, as the adjustment of stimuli, and others, may again come under discussion. The subject is too vast to be more than touched on in these commentaries, and it should contain larger views than those usually taken of what is happening now and then to other animal organisations. The cattle plague might, I think, have been made much more useful. I cannot find that any investigation of the nature of the disease has been undertaken that at all satisfies the requisitions of ordinary philosophical research. Animals covered with fat itself (except in hypernating animals), a sort of

link between health and disease, and kept even in some of the least objectionable yards, breathing air contaminated with the effluvia of their own secretions, are not likely to have the maximum of resisting force. Whilst stamping out the disease in many cases by the slaughter of the affected as well as associated animals seems ignoring all possibility of acquiring any information.

The reference of other epidemics to certain waters (in the sense in which that reference is put forth) seems to me a confused mixture of true and false. It appears to me that the true expression with regard to such important matters as water, and other things in daily use, is not that they contain the germs, or by what other term, the force of the epidemic may be called, but that like all other things which contain anything unnecessary to the constitution of the body, they are daily necessitating a certain expenditure of force, which though small *de die in diem* is still a gradual diminution of that integral status of healthy force on which the full power of resistance to injurious influence, or the power of combating them, depends. As I cannot lead up to it from any point more convenient, I shall in the next commentary offer the results of certain researches in aid of developing some generalisation of the effects which poisonous, whether dietetic, chemical, or mechanical forces appear to have in common.

PAPERS ON DERMATOLOGY—No. IX.

ERYSIPELAS.

By T. W. BELCHER, M.A., M.Ch., and M.D. Dub., B.M. and M.A. Oxon.

FELLOW AND CENSOR OF THE KING AND QUEEN'S COLLEGE OF PHYSICIANS; PHYSICIAN TO THE DUBLIN DISPENSARY FOR DISEASES OF THE SKIN; &C.

(Continued from 21st August, 1867—page 174.)

SEVERAL months ago I was called in to see a gentleman of full habit, florid complexion, aged about 50; and residing in this city. At the time of my first visit, he had been ill for five days, and I found him affected with idiopathic erysipelas of the head and face. I need not detail the various symptoms of this disease, as they are to be found in all works on general medicine; but as to the cutaneous aspect of the question, I may refer the reader to page 40 of my edition of "Neligan on Diseases of the Skin." It may be added that the patient in the present case was periodically subject to attacks of this kind, in which he had been usually attended by the late Dr. Neligan. When I first visited him there was copious serous exudation from the affected parts, which were much swollen; he had not slept during the previous night; and the constitutional fever was considerable. I directed the diseased parts to be painted with mucilage of starch; also, that the patient should be fed on beef-tea, and a mixture of milk and soda-water. He was further advised to take the following mixture:—

℞ Liquoris opii sedativi minima quadraginta.
Tincturæ cinchonæ flavæ drachmam fluidam.
Aquæ camphoræ uncias fluidas quatuor. Misce.
Fiat mistura cujus sumat unciam sextis horis.

On the following day—the seventh of his illness—he was much better in every respect. The swelling was adminished, the fever had materially subsided; and the discharge was equally improved. The treatment advised and carried out on the preceding day was directed to be repeated; and he was further advised to take ten grains of the powder of yellow bark in an ounce of port wine, every four hours; and to have the affected parts stuped with decoction of poppy heads, and chamomile flowers before applying the mucilage of starch. On the sixth day from this date he was quite well and able to go about. The mucilage of starch, and other treatment above-mentioned, had been discontinued before this time, and instead thereof he had used nutritious diet, and cold cream local applications.

I shall now venture to make a few practical observations regarding erysipelas.

The term *Erysipelas* is derived from the Greek *eruthros* and *pella*. It is the *epiphlogisma* of Hippocrates; *Ignis sacer* of the Latins; *Febris Erysipelatosa* of Sydenham; *Erysipèle* of Rayer; *St. Anthony's Fire* in England; *the Rose* in Scotland;—and is well delineated in Plate I. of Dr. Neligan's Atlas.

In common with many writers, Dr. Neligan divided it into *Idiopathic* and *Traumatic*; while Cazenave arranged its varieties as follows:—*True Erysipelas*, wherein the inflammation is confined to the skin; *Phlegmonous*, wherein the sub-cutaneous areolar tissue is affected; and *gangrenous*, wherein mortification occurs.

Sir Thomas Watson, the Chysostom of Medicine, has, in his Lectures, proposed to restrict the term erysipelas to cases in which the head and face only are affected; but Dr. Neligan believed, and in my experience rightly, that not only was the disease not necessarily confined to the head and face, but that it sometimes *originated* in other parts of the body, and spread thence upwards. The late Dr. R. B. Todd, in his Clinical Lectures (Beale's edition, p. 155) observed:—"It is one of the features of this disease, that it has a remarkable tendency to spread, sometimes wandering all over the body, from face to neck, and from neck to trunk, being then termed *erratic* erysipelas."

The erysipelatous inflammation often shows itself at first on the tonsils, in which case the patient complains of sore throat, and this has been so common an occurrence in the practice of some eminent physicians, that Dr. Todd considered sore throat one of the earliest symptoms in this disease.

Erysipelas *phlegmonodes*, as already stated, indicates the extension of the disease to the sub-cutaneous tissue, and deeper seated structures; and it also is accompanied by local and constitutional symptoms of a grave character, sometimes ending in mortification of the affected parts.

The late Dr. Graves noticed the singular fact regarding the mode of the spreading of erysipelas, viz.:—That when it commences at any point of the mesial line of the body, it is apt to spread in a symmetrical manner, corresponding portions of the integuments being simultaneously attacked on both sides.

As regards the inflammation sometimes attacking the membranes of the brain, the larynx, trachea, and gastro-intestinal mucous membrane, it may be observed that while some looked on this phenomena as *metastasis*, and therefore considered it a distinct variety, under the name *Erysipelas Metastaticum*, Dr. Neligan regarded it as merely an extension of the disease, having remarked that in all the cases which he had seen, the original local affection remained unaltered. Of *Traumatic* Erysipelas I need say nothing, as it properly belongs to surgery.

Frequency of Erysipelas.—It may occur at any age, even in newly born infants, in whom it attacks the umbilical region. It is believed to be more frequent in females than in males; in adults, than in the very young and very old; and I have known it to be a frequent enemy of men, who unhappily gave themselves up to the miserable slavery of drinking habits, being never drunk, and yet never sober.

Causes.—Excluding the causes of the traumatic form, the most common predisposing causes are cold, wet, deprivation of customary food and stimulants while exposed to inclement weather. The sins of gluttony and drunkenness, especially when conjoined with intense mental anxiety, are also fruitful predisposing causes; and the same may be said of violent mental emotion—bad passions, ill tempers; and—in young children—vaccination.

Contagion.—A vast amount has been written as to whether Erysipelas is contagious or not. I believe it is, and always act as if it were; and seeing that so much may be said on both sides of the question, the prudent course for a practitioner who does *not* believe in its contagiousness, is obviously to act as if it were a doubtful matter.

Persons who have once had Erysipelas, are peculiarly liable to contract it again, and as a matter of fact, often do so.

Diagnosis.—From Erythema it is distinguished by the severity of the constitutional and local symptoms; the smoothness of the surface, and particularly by the burning pain and tension. From the eruptive fevers—by the uniform redness of the erysipelatous surface. From phlebitis—by the absence of the cord-like feeling and linear inflammation. From synovitis—by the disease not being confined to or originating in the integuments of the synovial membranes.

Prognosis.—In general favourable, except in the aged, the infant, or in broken down constitutions. A low typhoid type, or the fact of the disease attacking an internal organ, indicates danger. If the larynx and glottis be attacked it mostly proves fatal, and that very rapidly, owing to the tumefaction which closes the respiratory tube.

Pathology.—It is evidently an acute inflammation of all the structures of the skin, and particularly of the vascular rete. According to some, the seat of inflammation is in the capillary lymphatics; while, according to others, it is situated in the capillary veins of the integuments.

Treatment.—This may be constitutional, or local, or both combined. The great variety of opinions on this important matter will cause no small surprise to the student. Some believe it to depend on a deranged condition of the hepatic secretion, and act accordingly. Others bleed and starve, while their opponents support and feed. Others, again, finding the urine to be acid, adminster an alkaline treatment in every possible form. Lastly, not a few are infidels as to constitutional treatment, and almost entirely neglect it. A similar variety, or conflict, of opinions prevails as to local treatment. All this arises, no doubt, from the fact that what a man has found to be successful in his own cases, he naturally thinks the best; forgetting the various and even opposed nature of different phases and types of the disease, at different times, and in different places. As to constitutional treatment, I think bleeding unnecessary and injurious, and antiphlogistic medicine and regimen, in many cases, equally so. The treatment detailed in the case above given, may, I think, be adopted *mutatis mutandis*, in typical or ordinary instances of idiopathic erysipelas. The supporting method is, I believe, absolutely necessary in cases occurring in large towns; and the judicious administration of stimulants has, in my experience, been attended with excellent results. Beef-tea, wine, or brandy, bark, and occasionally opium, may be regarded as so many flukes to one sheet-anchor in managing these cases.

℞. If internal organs be attacked, derivatives are, of course, useful; as are some active purgatives, such as the turpentine enema.

Of the many articles of the Materia Medica, commonly used to cover or protect the diseased and painful parts, I know of none better than mucilage of starch applied each day, and washed of with poppy and chamomile stupes. In the year 1856 I published, in the "Dublin Hospital Gazette," records of cases of small-pox and erysipelas, which were locally treated thus. Since that time I have treated many others in hospital and private practice, with an amount of success which fully justifies me in recommending it to my professional brethren. In recommending this plan, I by no means wish to deny the value of other local remedies, many of which are given in pp. 51-57 of my edition of Neligan on the Skin. I have seen several of them used with much benefit, but as the practitioner seeking for a good application in cases of erysipelas is often *bothered* (to use an expressive, though inelegant term) by the multitude of drugs paraded before him in books; it may not be thought out of place to lay before him—as I now venture to do—one which I can confidently recommend for use in all ordinary, and many severe, cases of this disease.

ON THE USE OF THE SYRUP OF THE PHOSPHATES OF IRON, QUININE, AND STRYCHNIA.

By HUGH WHITE, L.R.C.S.I.,

MEDICAL OFFICER CASTLETOWN DISPENSARY DISTRICT, BALLINGARRY, COUNTY LIMERICK.

Case 1.—A. B., aged 15—strumous diathesis—very tall for his age, accustomed to enjoy the usual field sports, such as hunting, shooting, &c., first complained of pain in the back of his neck one month after being sent to a boarding-school. The accession of pain was sudden; it was of an acute character, and confined to the region of the fourth and fifth cervical vertebræ. A diseased tooth, which was supposed to be the disturbing cause, was extracted, and attention being paid to the state of the digestive organs, no further treatment was adopted, his parents thinking as he would acquire strength in proportion to his stature, there would probably be no recurrence of the pain. However, such was not the case. He was removed to a school situate in a more salubrious locality, and given cod-liver oil for some months, but without permanent relief to his symptoms. Such is the history of the case for eight months prior to his presenting himself to me.

His statement was that when riding, particularly if going fast, or crossing a fence, the pain would occur in the region described, and of such an acute character that he felt unable to remain on horseback; that on the previous Sunday, when stepping out of the carriage to the ground, the pain came on with unusual severity, and lasted for several hours, and also that for some months he had a recurrence of pain of a more or less aggravated character three or four times daily. I ordered him:

℞. Pilulæ colocynthydis compositæ, gr. v.; hydrargyri, gr. v., in pil. ij.; hora somni summend. Applicetur papier d'Albespeyre No. 2 nuchæ colli.

I considered this a case of morbid nervous sensitiveness, with functional derangement, occurring in a strumous habit, and one suitable for the administration of the syrup of the phosphates of iron, quinine, and strychnia, so favourably spoken of by Dr. Lyons, as being well adapted for cases of this kind, where a neuro-tonic, assimilative, and blood procreative medicament, was desirable. The happy results which followed its exhibition more than realised my most sanguine expectations. This young gentleman has never had a recurrence of the pain during a period of now thirteen months. He enjoys excellent health, with increased appetite, the stomach, under the influence of the tonic, being able to appreciate the most nutritious diet, and he is now able to join in the usual rural sports, and take athletic exercise with an alacrity and vigour he was far from capable of before, which is a matter of congratulation to his parents, who feared the development of tubercle, several of the family having become victims to that dread disease, pulmonary consumption.

Case 2.—Miss R., a young lady, aged 16, nervous temperament, strumous habit, ænemic appearance, capricious appetite, with a dislike to animal food, menses occurring about every three weeks, predisposition to tuberculosis, and subject to frequent attacks of gastric irritation, complained of pain in the region of the spine from the eighth to the last dorsal vertebræ.

As I conceived this to be a case of morbid nervous derangement, with torpidity of the secreting organs, I ordered

℞. Pilulæ rhei compositæ, gr. xx.
Pilulæ hydrargyri, gr. x. M

Divide in pilulas sex quarum sumat ij omni tertiâ nocte.

℞. Syrupi ferri, quinæ, et strychiniæ phosphatis uncias duas
Sumat ʒi ter die.

Every alternate fortnight she was directed to use one teaspoonful of cod liver oil with each dose of the syrup. The cod liver oil I consider an admirable adjunct, as the syrup conceals its taste, and causes the irritable stomach to retain what it would otherwise reject.

This treatment was continued for two months, and had a most salutary effect, as the young lady acquired strength under its use, the assimilative powers were increased, and the natural secretions became healthy.

I might adduce many other cases in testimony of the decided benefit arising from the use of this syrup, which I consider is a happy and useful combination. Indeed, I think this preparation supplies a want long felt, as by its employment we can afford to the nervous, assimilative, and secretory systems, a tonic in such a minute and yet fully efficacious dose. Under these circumstances, I consider it an invaluable therapeutic agent, where malnutritive, due to the strumous diathesis, is suspected. I trust that when more generally adopted in practice, it will amply fulfil the favourable views entertained by Dr. Lyons in respect to its use, and I would also hope that it could be prepared with less expense, in order that the poorer classes who, unfortunately, suffer so much from maladies of the scrofulous and strumous diatheses, may experience through our dispensaries the beneficial results to be anticipated from its more extensive employment.

Hospital Report.

SPECIAL REPORT ON THE TREATMENT OF UNUNITED FRACTURES.

No. III.*

Professor BIGELOW'S Cases.

E. J., had been variously and unsuccessfully treated since 1857, when the accident occurred, until February 14th, 1860, when he was etherized, and a crucial incision made over the external surface of the arm over the fracture. The band of ligamentous tissue connecting the bones was divided, and each extremity of the humerus turned out. The periosteum was carefully detached, for an inch or more, from each end. The denuded ends were then sawed off. A hole was drilled through each end, and a stout silver wire passed through. The ends of the wire were then twisted, and the ends of the bone brought into exact apposition. The external wound was united with sutures; the ends of the wire were left protruding, and the former splint re-applied. After the operation, opiates were needed and freely given.

21st.—Wound smelling badly. A solution of chlorinated soda injected under the apparatus.

25th.—The apparatus was removed, washed, and re-applied.

March 5th.—Wound closing by granulation. General condition good.

23rd.—Arm apparently stiff.

29th.—To-day, the arm and shoulder becoming somewhat painful from pressure of splint and necessary want of cleanliness, everything was with great care removed; on slight examination of the arm, no motion was detected. The arm and shoulder were then carefully washed, lateral splints applied, and the hand and elbow supported in a sling.

April 4th.—The dressings were again removed. Slight mobility was detected at the point of fracture. As, however, only six weeks had elapsed since the operation, it appears to have progressed as rapidly as any compound fracture of an equally severe character could be expected to do. External wound nearly healed.

23rd.—Apparatus frequently removed. Union firmer.

June 13th.—Union appearing to be very firm, and the wire causing some pain, there appeared to be no further indication for its remaining longer. He was etherized; the wire was untwisted and removed.

July 1st.—Arm was stiff and strong, with considerable motion in the elbow.

July 12th.—At request, patient was this day discharged, being able to return to his work, which is that of a leather splitter. The arm appeared to be nearly as useful as the other one.

Case 2.—*Radius.*—Patient, A. D., farmer, aged 56, entered the hospital February 6, 1861. Four years before, he received a fracture of both bones of the right forearm, with other injuries, by being caught in machinery. No treatment having secured union, nine months after the receipt of the injury, an incision was made over the lower border of the forearm, the ends of the fractured ulna were turned out and sawed off, and the extremities then wired together. Various other means were subsequently resorted to, but with no success.

On entrance, the fractured ends of the ulna could be felt distinctly; there appeared to be some ligamentous union in the radius. He had a very considerable use of the hand.

February 9th.—*Operation by Professor Bigelow.*—He was etherized; a tourniquet was applied over the brachial artery to keep the wound dry. An incision was then made along the upper border of the radius, about two inches in length. The ends of the bone were turned out, the periosteum was dissected up, and about half an inch of each fragment sawed off. A hole was now drilled through the upper wall into the medullary cavity of each end, and the ends of the bone firmly wired together by means of a stout silver wire passing through the holes and twisted. Two small arteries required ligature. The edges of the wound were drawn together by sutures and a compress applied. The arm was placed in an external angular splint, and bandaged firmly, to prevent motion.

12th.—The pain in the arm is quite severe and constant. Considerable swelling about the wound. The bandage is daily removed.

March 1st.—Wound nearly healed about the wire. Appetite and strength excellent.

23rd.—Patient allowed to go home, to return for the removal of the wire.

February 13th, 1863.—Patient has been able to saw wood with his right arm. He came to have the wire removed, which has remained since the operation.

14th.—He was etherized. An incision half an inch in length was made over the point of fracture; the wire was divided and easily removed, two years from the time of its insertion.

Case 3—*Humerus.*—Patient, J. C., labourer, aged 24, entered the hospital November 4th, 1861. Eight months before, while turning the crank of a handcar, he became entangled in some way, and his left arm was drawn under the crank and fractured above the elbow.

Now, the left arm is about one inch shorter than the right, from the ends overlapping each other. The fracture extends from a point about four inches from the lower end of the humerus, on the outer side of the shaft of the bone, obliquely inwards and downwards, terminating at a point about two inches above the internal condyle. Crepitus and motion in the fracture are very distinct. There has apparently been no callus thrown out around the fracture. Motion in the elbow-joint is perfect.

9th.—Other means having been ineffectual, he was etherized and operated upon by Professor Bigelow. An incision, three and a half inches in length, was made through the skin over the seat of fracture. The subjacent fibres of the triceps were then divided, as was also, accidentally, the musculo-spiral nerve, with the exception of a single fasciculus, by which the extremities hung together, and which was afterwards carefully respected. The ends of the fractured bone were then turned out; the periosteum was carefully detached from both; a piece one and a half inches long was sawed from the lower fragment, and a piece one inch long from the upper. A hole was then drilled through each end of the fractured bone, and the two surfaces kept in apposition by a silver wire, passed through the holes and the ends twisted. An inside and outside

* Gentlemen who may be willing to furnish reports of cases of ununited fracture to be included in this special report, will oblige by forwarding them immediately to the Editor of the Hospital Report Department, 20, King William-street, Strand, London, W.C.

angular splint, well padded, were then applied. A single suture was introduced to keep the edges of the wound slightly in apposition. The extensors of the hand are paralyzed.

13th.—Splints were removed and reapplied. Position excellent. Slight suppuration in wound.

16th.—Splints removed, and arm dressed.

21st.—He has slight paralysis of sensation on the posterior radial aspect of forearm, and no sensation over the back of thumb and radial side of forefinger.

29th.—Appetite poor. Pulse accelerated.

December 17th.—Slight stiffening at point of fracture.

27th.—Considerable stiffness in humerus. Wound nearly closed.

January 10th, 1862.—Union moderately firm.

March 1st.—On careful examination, a slight yielding was detected at the point of fracture.

11th.—A small piece of necrosed bone came away from wound.

May 10th.—Patient was etherized. An incision was made down upon the wire, which was then extracted.

22nd.—Discharged, well.

This patient wrote, April 28th, 1867, that he was a "section hand on the Northern Railroad," had not lost a day since he left the hospital, and was "well, doing the hardest kind of work." Sensation and motion in hand perfect.

Case 4.—*Humerus.*—Patient, E. D., labourer, aged 31, entered the Hospital December 4th, 1862. A year before, his left arm was caught by a revolving shaft, and the humerus fractured. The skin was much contused, but not penetrated. Now, he has a false joint a little below the middle of the humerus.

December 6th.—Operation by Professor Bigelow. Patient was etherized. An incision, four inches long, was made over the outer aspect of the false joint, and the ends of the fragments were exposed. Both ends were irregular in shape, especially that of the upper fragment. They were bound together by a tough, pearl-coloured, gristly material, quite firm to the knife. The periosteum was dissected up and turned back from about an inch of the end of each fragment; the ends were then sawed off square, and a hole bored through each fragment at a point a quarter of an inch from their ends. The two fragments were then brought into apposition and held in place by a silver wire passed through these holes and twisted. The free ends of the wire were long enough to project from the wound. Sutures were then inserted, and angular splints, external and internal, were applied.

10th.—Suppuration well established. Splints removed, and wound dressed.

20th.—He has lost appetite during the last twenty-four hours. On removing splints, an erysipelatous blush was seen over the whole upper arm. R. Quiniæ sulphat, gr. ij., ter die. Beef-steak and wine, if he will take them.

24th.—Splints changed. Doing better.

January 2nd, 1863.—Patient is quite strong and cheerful. On removing the splints to change dressings, considerable stiffness is found in arm. Suppuration is moderate; the wound is closed, except immediately about the ends of the wire.

4th.—Considerable pain at the point of fracture, and in elbow.

14th.—He walks about.

16th.—The pus has burrowed towards the elbow. Much weaker. Beef-steak, wine and eggs.

23rd.—There is tenderness and redness over the internal condyle, apparently from the commencement of a large abscess.

27th.—He has been very wretched since the last record, from great pain in the abscess. The splints were unbearable and were removed yesterday. The arm is laid on a large poultice, with an external straight splint. The abscess was freely incised under ether, and the various sinuses were torn into one.

31st.—Patient was etherized, and the wire cut and withdrawn.

February 4th.—Patient is improving wonderfully. He sits up all day, and walks about freely.

18th.—Wound entirely closed.

26th.—The arm is quite stiff at the point of fracture.

March 9th.—Discharged, well.

Case 5—*Femur.*—Patient, B. H., teamster, aged 27, entered the hospital March 10th, 1863. Five hours before admission he was run over by a heavy team, the wheel passing over the middle of the left thigh. The whole of the left thigh is greatly swollen and ecchymosed, shortened about two and a half inches. The fracture is perhaps comminuted, and at the middle of the femur. Desault's apparatus was applied.

April 18th.—Comfortable since the last report. Desault's apparatus was removed to day. Limb in excellent position. There is apparently considerable callus, but the thigh appears flexible at the point of fracture.

21st.—A starch bandage, stiffened with pasteboard, applied to the limb from the middle of the leg to the upper third of thigh.

30th.—He sits up daily.

May 4th.—Upon examination to day, it was found that there was no union.

6th.—Desault's apparatus re-applied.

7th.—Apply over fracture emplastrum cantharidis (6 by 4).

23rd.—No union. Apply extension by weight.

August 1st.—Starch bandage was applied over leg and thigh. R. Calcis phosphat., gr. x., 3 t. d.

15th.—The starch bandage was removed, and extension by weight applied.

September 2nd.—After a careful examination, it was decided that there was no union at the point of fracture.

8th.—A starch bandage was applied, and he was allowed to sit up.

December 5th.—Patient now came under Dr. Bigelow's care. No union. He was etherized, and a seton passed between the fractured ends of bone and out through the other side of the thigh.

16th.—Profuse discharge from lower wound.

27th.—Seton removed.

February 2nd, 1864.—Discharge from wound diminished. Apparently but little stiffness.

June 4th.—Patient has continued in the same condition since the last record. There is no union. He was etherized, and the ends of the fracture were drilled in several different places.

18th.—There has not been the slightest inflammation in the thigh, produced by the drilling.

July 20th.—There has been no change in the thigh since the last report. The ununited ends of bone are surrounded by a large amount of indurated tissue, which makes it very difficult to get at them. He was etherized, and the ends of the bone were again and more thoroughly drilled. At most parts the bone was quite hard and normal, but at one point it was soft, and on withdrawal the drill was followed by quite a stream of oil from the degenerated marrow. The limb was placed in a straight splint.

November 4th.—There is no stiffness at the point of fracture.

12th.—The patient was etherized, and Professor Bigelow operated as follows:—A long, semi-circular incision was made on the outside and back of the thigh, its convexity downwards, over the ends of the bone, to favour the discharge of pus. The muscles of the thigh were found to be indurated, so that the ends of the bone were turned out with great difficulty. The ends of the bone were smooth, rounded and conical. The periosteum was then turned back for about one inch on each end, and the bones, thus denuded, cut off with a chain saw. The medullary substance was slightly degenerated and fatty. A hole was then drilled through each extremity of the bone, and a wire passed through these holes and twisted, not tight, but leaving a small space between the ends, to allow of sufficient motion to prevent breaking the wire or the bone. The periosteum was then brought together and the wound

closed by sutures. The limb was placed in a McIntyre's double-inclined, iron splint, bent at an angle of 135°. The operation occupied about two hours, during which time the patient was kept thoroughly etherized. Cold-water dressing.

13th.—He has considerable irritative fever to day. Pulse 132. Tongue thickly coated. The pain is relieved by acetate of morphia, one-sixth of a grain, subcutaneously.

15th.—Much brighter to day. Pulse 100.

16th.—Suppuration has commenced.

23rd.—The leg and thigh have remained until to-day on the McIntyre splint, but the suppuration has increased so much that it requires removal for daily dressing. A pasteboard splint has been moulded to the anterior and inner part of the thigh and stiffened with dextrine; to this the thigh and leg are firmly bound, leaving the wound open. Above this a Smith's anterior splint was applied, by which the whole leg is swung from a framework over the bed.

27th.—The splint works admirably. Less pain. The wound looks well, and is suppurating freely. Appetite good.

December 24th.—The bandages and splints were removed and reapplied. There seems to be considerable stiffening, and the bones are in good position.

January 13th, 1865.—No motion is observed at the point of fracture.

February 12th.—The limb is so firm that it was laid on a pillow, with only pasteboard splints applied.

April 26th.—Under ether, the wire was cut down upon and removed.

May 17th.—He is up and dressed. Appetite and general health excellent. He wears a dextrine bandage for the support it affords him.

June 1st.—He walks about on crutches. The knee is quite stiff.

July 1st.—Wounds entirely healed. The motion in the knee is returning.

12th.—The femur is perfectly firm and free from pain. He was furnished with a thick-soled shoe. Discharged, well.

November 10th.—He came to the hospital to-day. He is able to walk without the aid of a cane. Not the least motion can be detected in the femur. The knee is flexible.

Case 6.—*Humerus.*—Patient, T. C., soldier, aged 41, entered the hospital April 15th, 1864. He was wounded by a Minié ball in the right humerus at the first assault on Port Hudson, summer of 1863. The bone was broken at about the junction of the middle and upper thirds, and was considerably splintered. According to patient's account, the surgeon sawed off about an inch from each end, and then approximated the ends of the bones by means of splints, but did not wire them. He was then put in an ambulance, carried fifteen miles over a rough country, then in a steamer for some distance, so that it was two days before he arrived at a hospital. The wound soon healed, but the bones did not unite, and have not since.

April 16th.—He was etherized. Professor Bigelow operated. An incision was made over the point of fracture. The ununited ends were forcibly everted. The periosteum was carefully dissected up and reflected, and the denuded ends sawed off. A hole was then drilled through each end of the fragments. A wire was then passed through these holes and twisted. The periosteum was brought together, and the wound closed by sutures. The arm was placed in an outside angular splint.

20th.—The arm has moved from the splint, and is quite out of position, so that the ends of the bones are at a slight angle with each other. The angular splint was removed, and the arm placed on a broad straight splint, with two shorter side splints to keep the fragments in place.

23rd.—The wound is suppurating freely, and the arm is in good position.

May 2nd.—The wound has nearly healed, except at the point where the wires emerge.

June 10th.—Patient walks about the yard, with the arm firmly supported. There is considerable firmness at the point of fracture.

24th.—The arm is stronger. Discharged.

September 17th.—He returned to the hospital to-day with the arm so strong that he can use it for all ordinary purposes. The wire was removed, and the humerus was found to be perfectly firm.

December 16th, 1865.—The arm is perfectly firm, and for some time he has done a great deal of heavy lifting, such as wheeling coal, without favouring the injured arm in the least.

Case 7.—*Humerus.*—Patient, E. S., female, aged 45, entered the hospital Nov. 10th, 1864. She had an ununited fracture of the right humerus, the result of a compound fracture received a year and a half previously. Seven months after the accident there was no union at the point of fracture. A seton was passed between the ununited ends, and allowed to remain for a month. Notwithstanding this and other forms of treatment, no union followed. On entrance, there was a fracture of the humerus in its lower third; the ends of the bone were drawn widely apart by the weight of the forearm, unless held in place by an apparatus which she had worn for the previous seven months. She was a large, corpulent woman, with flabby tissues.

November 19th.—She was etherized this morning, and Professor Bigelow made an incision, three inches long, on the outer and posterior aspect of the arm, just above the external condyle. The ends of the fragments were then turned out, the periosteum was dissected back for about an inch and a-half on the lower fragment, and two inches on the upper. The denuded bone was then sawed off; on the upper fragment by a single stroke of the saw. The bone was much atrophied, softened and degenerated, the holes for the wire being easily made with an awl, and the bony tissue easily cut with a knife. A wire was then passed through the outer sides of the shaft of the bone, and twisted so as to bring the ends nearly but not quite in apposition, lest the tight wire should break the bone. The edges of the wound were brought together with sutures, and the arm placed in an inside angular splint.

Afternoon.—The arm is so unwieldy that it cannot be sufficiently confined in the inside splint. It was therefore laid on a flat right-angled splint.

27th.—Pulse and appetite good. Wound clean, and suppurating healthily.

December 30th.—℞. Calcis phosphat., gr. x., 3 t. d.

January 7th, 1865.—The wire has apparently torn out of the bone. No stiffening at point of fracture.

March 20th.—No union.

April 1st.—Patient was etherized, and an incision made down upon the bone, and the wire was removed. The ends of the fragments were turned out, and found so degenerated, that they could be easily broken with the fingers. Forearm œdematous and tender.

26th.—The arm was to-day amputated, at the patient's desire. The end of the upper fragment was removed.

May 21st.—Stump has nearly closed.

June 17th.—Discharged, well.

CURRENT LITERATURE.

Dr. Edwin Lee has issued as an additional supplement to his work on the "Medical Profession in Great Britain and Ireland," a pamphlet entitled *The State of the Medical Profession further exemplified.* It is well-known that Dr. Lee has for many years devoted considerable attention to this subject, and has extended his observations to the state of the Profession on the Continent. It is not, therefore, needful to enter very fully into his opinions. Suffice it to say that they are put forward with considerable skill, and that in their defence he quotes those of this and many other journals. The first chapter is devoted to the Medical Act and the Medical Council, the shortcomings of which are told without sparing. The second section is a telling critique on the abuse of the licensing power; and the third examines at length the subject of medical schools and clinical instruction. The defects of these having been throughly considered, a chapter is devoted to the evil consequences of the prevailing abuses, and another to the prevalence of extra professional influences. Those who desire to read up this question

afresh should get Dr. Lee's pamphlet, not only for what he says himself, but because the numerous quotations with which his remarks are supplemented, give a clue to the opinions entertained by many others.

There is an Appendix to this pamphlet entitled a "Pendant to the Autobiography of Sir B. Brodie." It is one of the most severe and hostile notices ever penned upon the deceased baronet. We may be excused for entering upon this just now, for although included as an exemplification of some of the evils denounced in the pamphlet, we are more immediately concerned with them, besides which, our own opinions on some of the points touched upon have long ago been expressed.

We have said that Dr. Lee has written fully on the evils that now weigh upon our profession. We are so often called upon to comment upon these, that we must refrain from any quotation respecting them. We are glad to say that our author has however not stopped here. In his concluding remarks he has propounded his scheme for their redress, and it will encroach less on our space to quote it than to criticise its several parts—as moreover, in this part of the journal, we are rather desirous of summing up than commenting upon the opinions of authors, we here give Dr. Lee's conclusions :—

"1. The absence of any legislative supervision.

"2. The regulation of medical affairs being left to a number of corporate bodies and universities having conflicting interests.

"3. Examiners for medical and surgical diplomas in those bodies having a pecuniary interest in the number of candidates who present themselves for examination, and consequently the overcrowding of the profession, and the introduction into it of many imperfectly qualified persons.

"4. The prevalence of favouritism, undue and extra-professional influences, in the election to hospital appointments, and the consequent frequent inefficiency of the teachers in the practical departments of medicine and surgery, and likewise as respects the treatment of hospital patients. Moreover, the great opportunities presented by hospitals for promoting the progress of medical and surgical science are by this means often made but little available for this purpose ; while, by the frequent exclusion of highly-qualified gentlemen from the staff of hospitals, a vast amount of talent by means of which these opportunities might have been made conducive to this object and to the public welfare, has been lost to the country.

"5. The election, without regard to superiority of qualification, of gentlemen who have held hospital appointments to examinerships, and into the Medical Council, as delegates of the various corporate bodies, whose interests alone they have sought to promote.

"6. The separation in education of medicine from surgery ; the too exclusive attention to surgery on the part of a majority of students who in their after career are called upon to practice *medicine*, and the existence of a large proportion of medical practitioners who possess only a surgical diploma.

"7. The absence of a due appreciation of professional and scientific claims, which restricts the number of zealous cultivators of medical science, and not unfrequently occasions the ruin or expatriation of highly-qualified men, whose talents might otherwise have been made available towards adding to the stock of knowledge, and promoting the welfare of the community.

"8. As a consequence of the last-specified and other causes, the frequent adoption of various indirect and unprofessional means of attempting to succeed in practice, by which ill-feeling and jealousies between members of the profession are fostered, the profession itself is lowered in public estimation, and the extension of quackery is favoured.

"The principal requirements to be embodied in a bill for the effectual correction of abuses and for improving the medical organisation of this country appear to me to be the following :—

"1. A suitable representation of the medical profession in Parliament, and an efficient legislative superintendence of medical affairs, such as exists in the other civilised countries of Europe.

"2. The formation of a competent and disinterested Medical Council for regulating the details connected with medical matters, under the supervision of the Secretary for the Home Department, and accountable to Parliament ; and periodical reports of its proceedings to be published. (The Council needs not be wholly composed of medical men, but those forming its most essential part should be well known, irrespectively of their connection with particular institutions, and should be elected by the votes of members of a certain standing in the profession).

"3. The numerous bodies now empowered to grant licences to practise to be superseded by three central licensing boards, one in each of the capitals of the empire ; the licentiates in medicine, surgery, and midwifery who pass the examination at one or other of these boards being authorised to practice in any part of the United Kingdom.

"4. The universities, colleges of medicine and surgery, and Apothecaries' Companies, to be empowered as heretofore to grant degrees and diplomas to licentiates who pass their examinations, and who may wish to practise medicine (as physicians) or surgery separately, or both combined. No medical degree or diploma, however, to be conferred upon any one who has not passed an examination at one of the central boards.

"5. In no case should examiners have a pecuniary interest in the number of candidates presenting themselves for examination ; their compensation should be by a fixed stipend, as it is in other countries.

"6. Among the chief functions of the Medical Council may be specified the supervision of hospitals, both as regards their internal management, and also the competency of the medical officers and lecturers attached to these institutions. Private schools should also be subject to the supervision of the Council, as affording a guarantee of the competency of the teachers.

"7. Due encouragement should be given by the Legislature to the cultivation of medical science by conferring suitable distinctions and recompenses upon such persons who prove themselves entitled thereto.

"8. In the practical department of education means should be adopted for ensuring on the part of students that a greater share of their attention be directed to internal pathology and therapeutics than has heretofore been the case, instead of to surgical pathology and operations.

"(The formation of the central examining boards would greatly tend to achieve this object, as persons could not then practise medicine under a mere surgical diploma)."

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 4, 1867.

LONDON VICTIMISED BY ITS GREAT SEWAGE WORKS.

WHAT will not engineering skill now accomplish? When guided by the light of experience and due observation of the laws of nature, we consider our engineers of the present age capable of effecting truly great and invaluable works; but when the principles which nature acts upon are neglected, then the greatness of the undertaking but adds to the evil inflicted upon the community. We quote the following from a contemporary :—

"A sufferer, in the *Times* of Wednesday, again complains of the nuisance to which we have already referred as periodically occurring in Bel-

gravia. This gentleman states that his house has been flooded three times within the last three months, and has suffered so severely that he has instructed his servants to regularly watch the rise and fall of the barometer, and to prepare accordingly. He complains of the Sewer Commission as being at fault, but beyond trapping the drains what can they do? Water will obey the laws of specific gravity, and if people elect to live below high water mark they must take the consequences. It is certainly to be regretted that the most fashionable quarter in London should be so situated, yet so it is. Nor does the mischief cease where it appears to do. It is, no doubt, sufficiently annoying to have one's house flooded with the most abominable refuse imaginable, but when the flood subsides and the water has passed away, what is left behind? Matters which no care or cleansing can remove; the foundations of the house are sapped, the ground on which it stands is impregnated with sewage, and in every crevice are left behind particles of germinal matter capable, if a proper nidus be found for them, of giving rise to zymotic disease, the intensity of which would be increased ten fold by the gradually debilitating process the inmates have undergone from its presence. Cholera is gradually extending its ravages; if it reach this country, how will it find the inmates of such dwellings prepared?"

Rightly does our contemporary point out the difficulties of dealing with districts occupying low levels, but we would ask, are our engineering staff incapable of dealing with the matter? If the men of the low countries were as helpless, where would their property and their industry, and they themselves be?

In 1857, the London authorities invited tenders of schemes for the main drainage of the metropolis. One hundred and fifty-one plans were sent in, which were revised by a Goverment Commission, and these, with the observations of the Commissioners, were placed at the disposal of the Metropolitan Board of Works. Subsequently the engineer of that highly important body constructed a plan, which he states is his own. We will not stop to claim for those who tendered the plans a greater or a less share of the credit of the great works now existing; but we must assert that at least one plan* insisted upon the necessity of providing for floods. Indeed, the plan we refer to regarded accommodation for surface drainage as of primary importance.

Now, we learn that the present system provides only for a rain-fall of about one quarter of an inch in the twenty-four hours; whereas, one of three inches and a quarter has recently occurred in the metropolis.

Again, the evils of the system, as at present working, does not stop with the frequently recurring floods mentioned by "Sufferer" and other writers. The deposit of silt at out-falls of the main drains is assuming a magnitude which promises shortly to demand attentive consideration.

The subject is too large and too important to be treated of in the short compass allowed in our pages. We learn, however, that Dublin is promised an undertaking resembling the main drainage of London, and tens of thousands are spoken of as the cost. We would warn the inhabitants of the second city in the Empire against any such plan—the evils of which are not to be reckoned at an expenditure of money, whether amounting to millions or to hundreds of thousands—and we must add that all such plans of drainage but intensify the evils inseparable from the lazy, imperfect, unnatural, and most pestiferous custom of polluting our water-courses, as well as our dwellings and the soil of our cities and towns. The present great water system will, if continued, spread debility, sickness and mortality, throughout the land, at the same time that it robs the soil of those elements due to it, and without which it becomes impoverished and exhausted. We must, however, reserve the further consideration of the question on this and on other points until a future occasion.

Notes on Current Topics.

THE LATE PROFESSOR FARADAY.

Even at the ripe age of 73, it seems too early for us to lose the great exponent of physical science, who seemed blest with continual youth. Yet so it is. The lecturer who delighted the youth with his teachings, as much as he astonished the most learned with his profound knowledge, who throughout his career had been connected with the Royal Institution, will no more fill his accustomed place there. Born in a lowly sphere, he has raised himself to the very highest pinnacle of fame by his devotion to experimental and physical science. The pupil and successor of Sir Humphrey Davy, he wore the mantle of his master with dignity, achieved for himself a position which attracted the attention and respect of every class of his fellow men, from the occupants of thrones downward, and lived a life that will serve as an example and an encouragement to many a weary, hard-toiling student in the distant generations. The monument of his memory will remain in every laboratory where love of science inspires the workers. Will not this be more durable than marble?

LAUDANUM AND RHUBARB.

Two children have lately been poisoned through laudanum being sold instead of tincture of rhubarb. The jury find verdicts of accidental death, and accompany them by censure on the negligence which causes these accidents, yet they continue to recur. In those instances where the drugs are sold by the ignorant keepers of little sundry shops or small groceries, the remedy is clear. They ought not to be permitted to sell poisons. But, unfortunately, in one instance last week, this "misadventure" took place in the hands of a regular chemist, accustomed to the duties of dispensing. In consequence of the alphabetical arrangement often adopted, the two bottles containing laudanum

and tincture of rhubarb very frequently stand close together, and their colour is nearly alike. A general practitioner of our acquaintance, whose pupil once nearly made this mistake, always afterwards insisted on the laudanum bottle being kept out of its alphabetical order—at the extreme end of the shelf. We commend the example to all concerned.

THE PUBLIC HEALTH.

THE last return of the Registrar-General shows a decrease in the mortality of London. The deaths are once more less than the estimated number—this time by 65. The decrease is, however, not due to any decline in diarrhœa. There were in the week 1247 deaths registered—the average for the 34th week of the year corrected for increase of population being 1312. Diarrhœa carried off 188 children, and 8 adults. In the last seven weeks the numbers dying from this disease have been 115, 170, 196, 217, 189, 200, and 196 respectively. The deaths of 13 children, and 5 adults, were returned as caused by cholera.

The annual rate of mortality during the week was 21 per 1000, in London. 19 in Edinburgh, and 26 in Dublin ; 23 in Bristol, 27 in Birmingham, 30 in Liverpool, 29 in Manchester, 26 in Salford, 22 in Sheffield, 33 in Leeds, 22 in Hull, 33 in Newcastle-upon-Tyne, and 24 in Glasgow.

The following proportions of the above rates were referred to diarrhœa in the different towns :—In London, 3·3 per 1,000 ; in Sheffield, 4·6 ; in Newcastle, 6·3 ; in Liverpool, 7·0 ; in Birmingham 8·8 ; in Leeds, 9·0 ; and the highest, 10·3 in Manchester and Salford.

We continue to watch with interest these important mortality returns. The lessons they teach our readers must be almost weary of hearing. Yet how supine are our local authorities !

THE DRAINAGE OF MILAN.

MR. GILBERT W. CHILD has published an account of the manner in which the drainage of Milan has been effected. The whole works are in the hands of a company possessing a reservoir outside the city. Instead of sewage pipes the cesspool system is in full operation, and yet, according to Mr. Child's personal experience, the emptying of them, and the removal of their contents to the extra-urban reservoir, is affected without the least smell being perceived. Moreover, the value of the sewage, as manure, is appreciated, and Mr. Child saw, last May, 120 farmer's carts waiting at the works to take it away. That the system is universally applicable no one would suppose, but there can be little doubt that it is preferable to the want of any system at all, and in some places it may prove to be the most suitable. The following is Mr. Child's description of the plan :—

" The house sewage is excluded from the sewers, which serve as far as I understand, merely as channels for rain-water, and passes into cesspools. These are very frequently emptied, and it is in the method employed for emptying them that one of the distinctive features of the system is to be found. The carts used for the purpose are in the form of stout iron barrels placed upon wheels, and each is furnished with an aperture having an air-tight valve, which can be opened or closed at pleasure. The barrels are exhausted of air by an air-pump at the works of the company, and are then sent out on their rounds. When a cesspool is to be emptied a hose is employed. One end is introduced into the cesspool, the other is adjusted to the aperture of the barrel, the valve is withdrawn, and the whole contents of the cesspool are instantly sucked up into the barrel This operation is so neatly performed that it gives rise to no disagreeable odour, and so careful are the company's servants that I am assured their habit is, as soon as a cesspool s emptied and the aperture of the barrel closed, to plunge the end of the hose into a bucket of water, and by again opening the orifice of the barrel to suck up the water, and thus purify the hose before proceeding to another house.

" I can testify from personal observation that these carts constantly pass too and fro in the streets of Milan without giving any unpleasant intimation either to sight or smell, of the nature of their contents ; and I was informed by an English resident that his cespool was emptied in the day-time and immediately under his windows without the slightest offence.

" The sewage matter, collected as I have described, is conveyed to the works of the company, and there stored in a large covered tank. Thence it is taken away by the farmers, who buy it as they want it, and any surplus which may remain is made into a kind of poudrette and also sold as a manure."

ST. ANDREWS GRADUATES' ASSOCIATION.

THE Council of this Society met on Tuesday the 27th. The members of the Association were reported to have been increased by the addition of thirty-seven new graduates. Among those who have been elected honorary members, are His Grace the Duke of Argyll'; Professor Lyon Playfair ; the Professors of Medicine, Natural History and Divinity of the University ; Dr. Day, of Torquay ; the Senior Professor of Medicine, and others.

It was arranged that the proposed deputation to the Chancellor of the Exchequer and the Lord Advocate, should be deferred until the new Bill shall be under consideration. In the meantime, each graduate is to be earnestly solicited to urge the justice of the claim for the franchise on every M.P. with whom he may come in contact.

At the next meeting the Council will take into consideration the propriety of admitting future members by ballot.

The arrangements for the general session to be held December 2 and 3, were then considered, and papers were announced by Professor Playfair, Drs. Richardson, Edwards Crisp, Day, Proctor, Powell, Bishop, Williams, Sedgwick, and others. This Association is now completely established, and we cannot doubt that it will exercise large influence, not only over its members, but on the profession as a whole. The absurd nonsense that has been talked about the St. Andrew's degree was completely refuted by the statements put forth by the council, and which we have already epitomised. The value of the M.D. St. Andrew's is now universally recognized, and it is but just that it should carry a vote for the University member.

POISONOUS CIDER.

THE danger by which we are continually surrounded from the accidental impregnation of food or drink with poison was shown in an inquest held last Wednesday in Herefordshire. The deceased, who had drunk large quantities of cider, died with all the symptoms of lead poisoning. His companions, who had drunk some of the same cider, had also suffered severely, though not fatally. On analysis one grain of lead per gallon was detected in the cider. The jury and medical men visited the mill where the cider was made last autumn, and found those parts of the apparatus which were composed of lead very much corroded. The jury exonerated the person who made the cider, but very justly recommended that the whole of the remaining stock should be tested, and whatever was found bad thrown away. The case altogether points to a danger about which too little is thought. We use lead in so many forms, and it is so apt to contaminate all fluids with which it comes in contact, that the only wonder is there are not more deaths from lead poisoning.

THE WONDERFUL ZOUAVE AND HIS CURES

THE miraculous cure of a French marshall. When was the time that Paris had not some miracle with which to delight her visitors or some strange story with which to set her numerous gossips by the ears? Her latest sensation is a Zouave named Jacob, who blows the trombone when on duty, and when off, effects cures in a manner to eclipse even the mesmerists. What will the faculty do if people are all to be cured by a Zouave? What will become of the priests and the church if it sets abroad that Jacob can excell them all? The following quotation from a contemporary will amuse, if it do not instruct our readers. The remark about the medical papers is unique. What will our *confrères* think of it?

"Marshal Forey has been for two months at his country house, suffering from paralysis of the left side; and the other day, according to a Paris paper, he sent two aides-de-camp for Jacob, who obstinately refused, however, to accompany them lest it should bring him within grasp of the law regulating the healing art. At last Marshal Canrobert got him to accompany him to Bourg la Reine, where Marshal Forey lay. Jacob had the sick man, whose servants brought him downstairs on a litter, carried to the bottom of the garden, and remained there alone with him. An hour later, the narrative proceeds,—

'Two men were seen walking towards the house, one of them leaning on his companion's shoulder with one hand, while with the other he held a stick on which he supported himself a little. This man who, an hour before, could not rise from the litter in which he had been brought into the garden was Marshal Forey. The other was his doctor, his saviour, Jacob the Zouave. When they reached the foot of the steps leading up to the house the bystanders, already astonished at the change they witnessed, beheld Marshal Forey suddenly stop, throw his arms round Jacob, and warmly embrace him, and then, like Sixtus V. at the Vatican, he tossed away his cane and ascended the steps as alertly as a schoolboy.'

"The medical papers turn the Zouave into ridicule. If the above story and others equally circumstantial which have appeared in the papers be fabrications, they will surely meet contradiction from the persons named in them."

The most promising feature of this Zouave healer's career is, that he never accepts money for his services. He believes himself possessed of a sort of occult (he thinks magnetic) influence, which he consistently refuses to use as a means of enriching himself. He is not above forty years of age, and about half his life-time has been passed in the army. He was in the Crimea, but we did not then hear of his healing powers. He is further said to be very studious. The *Petite Presse* informs us that:—

"Jacob is at this moment in garrison with his regiment at Versailles. In the morning, from twelve to two he receives, in a room which has been lent him at a cafe opposite the barracks, the sufferers who come from Versailles and the neighbourhood to seek his assistance. At two he takes the train for Paris, and arrives at three in the Rue de la Roquette. The railway permits him to travel gratuitously, his colonel dispenses him from nearly all his duties. From three to six Jacob receives the infirm of Paris. At six he dines with his father, and at nine he goes to the Faubourg St. Germain, where he has a bedroom and where he passes the night. In the morning he starts for Versailles by the first train, arrives for roll-call, plays the trombone till ten, breakfasts, gives a sitting, and returns to Paris to treat his paralytics."

Last week the receptions described by our contemporary were interrupted by a notice from the district authorities, who have forbidden their continuance, on account of the annoyance to the neighbourhood caused by the large crowds of people thus drawn together.

A PROTEST AGAINST A COLLEAGUE.

SOME weeks since a medical contemporary devoted a considerable portion of its space to a republication *verbatim et literatim*, of certain printed directions issued by Dr. Dobell, in connection with the Royal Hospital for Diseases of the Chest, and bearing in large letters the name of that gentleman. Without doubt, practices of such doubtful propriety and such contravention of good taste, are worthy of the condemation which publicity must secure for them, and medical men who respect their professional rank are right to separate themselves from participation in such transactions. The following letter, addressed by the colleagues of Dr. Dobell, has been forwarded to us. It would add much to the force of the excommunication pronounced against Dr. Dobell, if we were informed how long the objectionable practices have existed, for if the disclaimer of these gentlemen was only elicited by newspaper strictures, it is worth very little:—

"To the Chairman of Council, Council, and Governors of the Royal Hospital for Diseases of the Chest, City Road. Gentlemen—We earnestly regret to express to you our united feeling that existing circumstances render it impossible for us to continue in the discharge of our duties as Medical Officers of the Royal Hospital for Diseases of the Chest. The anomalous position of Dr. Dobell as Honorary Secretary as well as Physician, his assumption of authority and his spirit of interference, would alone render our continuance in office incompatible with independence of action and self-respect. But his practice of issuing diet bills bearing his own name and that of the Hospital, one of which recommends a medical preparation originated by him (Pancreatic Emulsion), and the dispensing of the same medical preparation from the Hospital in pots bearing his name on the label, are still more decisively objectionable. We do not wish to express an opinion whether such practise is or is not in accordance with the intentions and principles of a public charity, or to question the propriety of applying its funds to any such purpose: it is enough for us to know that the practice is of a nature to call forth the most severe condemnation from those Members of our profession whose good-will and esteem we most value. Feeling therefore satisfied that we cannot continue to work in harmony with Dr. Dobell, and assured of what is expected from us by the profession, we find it to be the most direct and honourable course to place our resignation in your hands. We cannot, however, take a step which may dissever us from an Institution with which our names have been honourably connected during the most active years of our professional life without offering to you, the Governors and Council, our sincere respects and our warmest thanks for the long confidence you have reposed in us. That you may be put to the least possible inconvenience, we shall have pleasure in holding office until the appointment of our successors, if agreeable to you. We have the honour to remain, Gentlemen, your most obedient servants, Benjamin W. Richardson, M.D., F.R.S., 12, Hinde-street, W.; Arthur Leared, M.D., M.R.I.A., 12, Old Burlington-street, W.; Joshiah T. Powell, M.D., M.R.C.S., 347, City Road, E.C. London, August 22nd, 1867."

SUPERANNUATION OF WORKHOUSE MEDICAL OFFICERS.

WE rejoice to observe that the Board of Guardians of the Mullingar Union have established a precedent which has received the sanction of the Poor-law Commissioners, and having obtained this official approval, is of the utmost value to Poor-law Medical Officers.

At a meeting of the Board of Guardians on the 20th of June, a letter of resignation, in consequence of severe permanent illness, was read from Dr. Thomas Curran, who had been the zealous and efficient medical officer of the workhouse for upwards of twenty years, in which he reminded the board that he devoted the whole of his time to the performance of his official duties; that no fault had ever been found with him by the commissioners, their inspectors, the guardians, or even by the paupers, and hoping the board would consider him entitled to superannuation under the recent Act of Parliament. The board orderep

his application to be taken into consideration on the 25th of July, on which day, at a board attended by twenty-four guardians, viz., eleven *ex-officio* and thirteen elected, it was proposed by the chairman, and unanimously carried—"That Dr. Curran, late medical officer of the workhouse, having devoted the whole of his time to the performance of his official duties for more than twenty years, and now being obliged to resign from ill-health, this board hereby vote him two-thirds of his salary in accordance with the act 28th Vic., chap. 26, and the sanction of the Poor-law Commissioners thereto is earnestly requested." At a meeting of the board on the 8th August, a sealed order was received from the Poor-law Commissioners sanctioning the vote of the board.

We regard this as the most important decision which of late years has been arrived at in respect of Poor-law Medical Officers, because it affords Boards of Guardians the official proof which they have hitherto required to justify them in superannuating their aged and well-tried Medical Officers. It is at least an important step towards a voluntary retirement of Dispensary and Workhouse Officers who may feel themselves unable to continue their services, when the legality of the grant of a retiring allowance is officially established.

THE GUINEA WORM AND THE ABYSSINIA CAMPAIGN.

A correspondent of the *Times* of last Saturday, subjects the suggestions of our contemporary respecting the Guinea worm to the following criticism :—

"The *Lancet* states that 'while 10 per 1000 of the troops in Bombay suffered from dracunculus, as many as 246 admissions per 1000 from this complaint arose among the soldiers serving on the Gold Coast.'

"The Guinea worm does not molest Europeans. It has certainly been known to do so, but the Europeans thus punished have been always remarkable for their abhorrence of water. Europeans who are cleanly in their persons, who use a bath, do not, as a rule, have any acquaintance with the Guinea worm.

"The troops quartered on the Gold Coast were, until lately, Fantees, or natives of Cape Coast ; and they formed what was known at the Horse Guards as the Gold Coast Artillery Corps. About four years ago the corps was disbanded for mutiny. That fact, then, will account for the disproportion of admissions into hospital from Guinea worm between the soldiers at Bombay and the soldiers on the Gold Coast, the Bombay soldiers being mostly Europeans and the Gold Coast soldiers being entirely Africans.

"Again, the *Lancet* seems to think that the Guinea worm confines itself to the 'bare feet.' It attacks all parts of the surface of the body, and generally works its way into those parts which are exquisitely tender. The lips, ears, and eyelids even are not free from it. I need not hardly tell you that the presence of the Guinea worm soon sets up violent inflammation ; and, as it usually selects the flesh of the joints for its cyst, the patient rarely gets off with less than a stiff ankle or knee. Nine times out of ten, the stiffness is permanent.

"The mode by which the Guinea worm is extracted is very tedious and very curious ; and Captain Wilkes, a clever and scientific man, paid me a visit at Cape Coast immediately before his assault on the Trent, for the sole purpose, as he assured me, of witnessing the treatment and also the extraction of one. Fortunately he was gratified.

"I would, with great deference, suggest that the Director-General should lay his hands on as many medical officers who have served on the Gold Coast as he well can ; and it is almost a pity that an able officer, full of experience and of gallantry, like Staff-Surgeon Charles O'Callaghan, should have left for Cape Coast by the mail steamer which only started from Liverpool on the 24th inst. Might he not have been detained?"

CHOLERA THEORIES.

V.

(Continued from page 192.)

A WORK which attempts to explain the mysterious natur of cholera, which has attracted very general attention, and which has had some considerable influence on treatment, is the one by Dr. George Johnson ;* and the central idea of which is that a blood-poison exerts a special irritative action on the coats of the pulmonary artery, exciting spasm of its minute branches, so that, "during the state of collapse, the passage of blood through the lungs, from the right to the left side of the heart, is, in a greater or less degree, impeded." By means of this one alleged "central fact," Dr. Johnson attempts to explain the leading phenomena of cholera. Having carefully examined Dr. Johnson's theory, we are obliged to acknowledge that it seems a failure in respect alike to what it attempts to explain, what it ignores, and what, as a logical deduction, it prescribes, by way of treatment, viz., castor oil, for the purpose of increasing those eliminative processes by which life is generally destroyed.

Few theories have occasioned more controversy than this of Dr. Johnson's, which has received a very large share of attention, and has occupied many pages of the journals. In spite of the most strenuous opposition from a very large proportion of the reading metropolitan physicians, Dr. Johnson has, with considerable ability and no small confidence, urged his views upon the profession in season and out of season. We have on several occasions dwelt upon it at sufficient length, and it has been discussed in several of the departments of our journal by several different writers. Moreover, in a previous number of this very series on "Cholera Theories," we have given at length what we consider the most able criticism upon it that has yet appeared, viz., that which Dr. Chapman put forth in his work on "Cholera and Diarrhœa." We think, therefore, unless some of our readers have some new arguments to offer upon it, we may fairly pass on to other views that have not received so much attention on our part.

Dr. Sedgwick refers the failure of the circulation in cholera to a central arrest of the sympathetic nervous system. His extensive elaboration of the doctrine, that the primary seat of the disease is the stomach, and that through the medium of this organ is induced a disorder of the sympathetic nervous system," consisting in diminution or arrest of its functions is a signal example of the application of considerable intellectual power and extensive knowledge in the development and advocacy of a theory which we hold to be fundamentally false. Being informed by no central truth, the work is devoid of logical cohesion; and the laborious effort evident throughout to sustain a theory irreconcilable with the facts of cholera, is like twisting a rope of sand, and the only practical result which Dr. Sedgwick arrives at is to renew the often tried, and as often abandoned practice of bleeding during collapse.

Dr. Sansom, who has also tried to solve the problem which has so long baffled the medical intellect, assumes the presence of a poison which, coming in contact with the alimentary canal, acts as "a primary irritant," and thus causes the immediate phenomena of vomiting and purging. Moreover, the same poison becoming absorbed also acts as an irritant of the sympathetic nerve, the force and activity of which (according to Dr. Sansom, and contrary to the assertion of Dr. Sedgwick) is therefore increased ; and its exalted energetic action produces a general contraction of the blood-vessels throughout the body. Thus, the hypothetical poison "causes the combined phenomena of true cholera, diarrhœa, and collapse." Dr. Sansom, faithful to the commonly received doctrine of the existence of cholera "germs," recommends a medicine, calculated, *as he thinks*, to destroy these germs—viz., sulphite of soda.

Here we beg to remind him, that had he followed the most recent investigations on this subject he would pro-

* Notes on Cholera.

bably have accepted the conclusion, that the sulphites would destroy the vitality of a patient's blood more readily than germs such as those, to the presence of which he ascribes the phenomena of cholera. This is a point which should, we think, scarcely have been ignored by the proposer of the remedy in question.

By becoming "an irritant" of the sympathetic nerve the poison, according to Dr. Sansom, increases its force and activity, and so causes it to effect the remarkable group of symptoms constituting choleraic collapse. It is easy to assume the existence of a poison and then to affirm that acting as a primary irritant it causes vomiting and purging. But in all the numerous cases in which substances taken internally are known to act as "primary irritants," the peculiar discharges characteristic of cholera are never produced. Is not, therefore, this doctrine, that a hypothetical poison comes in contact with the alimentary canal, and there acting as a primary irritant, produces, in combination with the action of the sympathetic, the rice-water evacuations which no known irritants do produce, a pure assumption. If not, it is at least, incumbent on Dr. Sansom to demonstrate each link in the physiological chain of causes by which the phenomena in question are induced. The doctrine urged by Dr. Sansom concerning the state of the sympathetic may be the true one, but even then there is no necessity whatever for the assumption that that state is prodnced by a blood-poison. Moreover, Dr Sansom did not originate this theory concerning the state of the sympathetic. Although he makes no acknowledgment of the fact, the doctrine in question was first announced by Dr. John Chapman in 1864, and more thoroughly expounded in 1865, since which that author has not ceased to enforce it. It seems almost incredible that Dr. Sansom can be ignorant of Dr. Chapman's writings, especially as he confesses his obligations to Dr. George Johnson's, who has discussed in his "Notes on Cholera" Dr. Chapman's hypothesis. Perhaps Dr. Sansom thinks he has sufficiently acknowledged his indebtedness to Dr. Chapman by his statement in his preface, that he "has learned much from the medical papers." Others will probably think otherwise.

SANITARY STATE OF THE INDIAN ARMY.

We have been so long accustomed to hear of the unhealthy influence of the Indian climate, that we almost look upon it as a calamity to which British residents there are of necessity liable. The troops sent out from this country have especially suffered, being, from the nature of their employment, exposed in no ordinary degree to the different causes and conditions of disease in the localities where they are stationed. It is satisfactory, therefore, to know that the work of sanitary reform has been begun, and is progressing there as well as here. The Royal Commission appointed to inquire into the state of the army in India, has exerted a beneficial influence, the effect of which is that a Sanitary Commission has been appointed at each of the Presidencies, which, at no distant date may have a favourable bearing upon the general health of the population; while, with regard to the troops, immediate efforts are being made to secure that object. It is proposed, for instance, to remove them as much as practicable from stations which are notoriously unhealthy, to prepare hospitals for the proper treatment of the sick, to extend the hill sanitaria, to ventilate and cool the barracks, to purify the water, to introduce the "dry-earth system," and other means of warding off disease and arresting its progress. If these measures are legitimately carried out, it is considered that eventually a death-rate of 20 per 1000 "may be taken as the possible mortality."

The Bengal Commission have published their second annual report. It gives us returns of the diseases and mortality for 1865, which prevailed among the men, both British and natives, and also among the occupants of gaols in the Presidency. The British troops in that year numbered, on the average, 37,210. The proportion of daily sick throughout the year was 60 per 1000, which is less than in any of the preceding twelve years. The average death-rate was 24·67 per 1000. It ranged as follows:—In 17 military stations it was less than 20 per 1000; in 15 it was between 20 and 30; in 6 between 30 and 40; and in 6 others it was as high as 41 to 57 per 1000. There is, too, a difference observable in the death-rate of different regiments at the same stations, which the Commission account for, not from any variation in the healthfulness of those stations, but from the fact that the men, in some instances, have been previously exposed to malaria of some kind, and carry the effects with them, which remain after the cause has ceased to operate. As far, also, as it has yet been ascertained, the mortality is greater in proportion to the heat which prevails. Thus, at Calcutta, the mean temperature in the shade has been found each day to be 79·4°, and the deaths there were 14 per 1000. In Agra it was 91·9°, and the deaths were 22 per 1000, while in Benares it averaged 92·3°, and the mortality reached 41 per 1000.

Cholera produced 116 deaths among the European troops, which is less than in any year, with the exception of 1864, since 1858. The native constitution seems better able to withstand the attacks of this disease than the European, for though it was more prevalent among them it was far less fatal, the numbers being 49·7 per cent. of natives, and 72·5 per cent. of Europeans.

Small-pox has been slightly on the increase since 1862. The mortality reached 14·28 per cent. of the cases among Europeans, and 13·04 among natives. It appears from observations by Dr. Bryden that this disease attains its maximum in April, receding regularly from that time till in August and September it totally disappears.

Europeans have suffered much less from fever than the natives, the number of deaths respectively being 3·71 per 1000 of the former, and 4·38 per 1000 of the latter.

Dysentry and diarrhœa produced a death-rate of 2·87 per 1000, though these diseases, except in 1864, have become less prevalent each year since 1859, when the proportion was 12·6 per 1000.

Of late years there has been very little difference in the extent and effects of hepatic disease, the only fact worthy of remark is the large proportion of deaths from this disease among Europeans compared with native soldiers, the proportion being respectively 3·49 and ·28 per 1000. Apoplexy was more prevalent in 1865 than in any year since 1859. Delirium tremens, and venereal disease, have presented fewer cases, those of the latter were 227 per 1000 in 1865, whereas they amounted to 359 in 1859.

On the whole there is every reason to believe that the endeavours of the Royal Commission are working favourably, though gradually, on the health both of the troops and the population generally, and that we may at length find the condition of our soldiers in India to be as satisfactory as in England itself.

Foreign Medical Literature.

ON AMAUROSIS FROM THE ABUSE OF TOBACCO.

By P. THILESEN.

TRANSLATED FROM THE NORSK MAGAZIN FOR LÆGEVIDENSKABEN, XXI. BIND, III. HEFTE, 1867, P. 139.

By WILLIAM D. MOORE, M.D., Dub. et Cantab., M.R.I.A.;

HONORARY FELLOW OF THE SWEDISH SOCIETY OF PHYSICIANS; OF THE NORWEGIAN MEDICAL SOCIETY; AND OF THE ROYAL MEDICAL SOCIETY OF COPENHAGEN; SECRETARY FOR SWEDEN, NORWAY, AND DENMARK, TO THE EPIDEMIOLOGICAL SOCIETY OF LONDON.

Mackenzie[1] has long ago, without any particular attention having been paid to his statement, pointed out the fact

1 Traité des maladies des yeux par Mackenzie, traduit par Testelin et Warlomont, Tome ii., p. 830.

that the smoking of tobacco, continued for years, may produce amaurotic conditions of different degrees, which, obstinately resisting all treatment, sometimes cease with comparative rapidity when the patients leave off smoking. In Germany, where observations in this direction can be most easily made, on account of the enormous consumption of tobacco, exceeding that of almost any other country, writers seem unwilling to believe in any such effect of the plant. According to Arlt,[1] Beer mentions the occurrence of amaurosis after the use of tobacco, but he seems to regard the increased secretion and expectoration of saliva as the proper cause of the amaurosis. He mentions, also, an example of weakness of vision in a woman who used two ounces of snuff daily. Consequently, in this instance, the loss of saliva could not be the exciting cause. According to Arlt, sufficiently accurate observations as to the relation of tobacco to amaurosis are wanting. He, himself, seems to doubt the possibility of any such effect of the drug. I am not acquainted with von Graefe's opinions upon the subject. In 1859 he let fall, in the course of his lectures, some expressions, from which it would seem that we might infer that he did believe therein ; whether he has since altered his views or not, I am not aware. In his *Archiv für Ophthalmologie*, nothing appears upon the subject from either himself or others. On the other hand, there is reported in it a case of amaurosis after the use of quinia. Professor Donders, in a letter, respecting a patient sent to him by me, warns me against permitting the patient, who was by no means a great smoker, to use the ordinary quantity of tobacco, and wished to have his consumption limited to two cigars in the afternoon. Judging from this, Donders does not look upon Tobacco as altogether harmless. I understand that in 1862 a short paper, by Sichel, appeared in the *Union médicale* upon this subject. His essay is known to me only from a later article by the writer in the *Annales d'oculistique* for April 1865. In this, his last work, which I shall hereafter have occasion to mention more particularly, I find it stated that Wordsworth, in the *Lancet* for August 1863, has reported some undoubted cases of amaurosis from tobacco, as Hutchinson has done in the same journal for the following November.

At the time I became acquainted with Sichel's article on tobacco-amaurosis, I had under treatment a case of weakness of vision, for which I could find no explanation. Tobacco I had not thought of, and, therefore, I did not question him as to his habits with respect to it. I had then had the case under treatment for about a year without having been able to say that any improvement had taken place. I now examined him with reference to his use of tobacco, and it appeared to be such that we could, without any difficulty, refer his symptoms to it. I shall briefly relate his case—

N. N., a tailor, ætat. 35, of slender figure, and of an unhealthy, sallow complexion, states that having previously had remarkably good sight, he observed, rather more than a month ago, that his power of vision began to diminish, first in the left eye, and a week or a fortnight later in the right ; there had been no pain in or around the eyes, or in the head. In all other respects he was perfectly well. When I first saw him, he could read only such large print as No. 11 of Jæger's test-types. The characters were, however, not so black and sharply defined as they had previously been, and they had to be held much nearer the eye than formerly. Spectacles brought no improvement. As it seemed, the weakness of sight was distributed uniformly through the entire field of vision ; I could discover no defects in the same. Both eyes were equally affected. In the fundus of the eye nothing morbid could be discovered in either the choroid, the retina, or optic disk.

All his other functions appear to be in good order. The urine is normal. As a child he was never delicate, nor had he subsequently any serious illness, he never suffered from syphilis, many years ago he had gonorrhœa, which gave way after six weeks' treatment, leaving no ill consequences behind it. He has been many years married, has two healthy children, and has had no others. His residence is rather gloomy, but is not more unhealthy than the majority of those of most others of his position ; he says he is regular in his mode of life, and denies that he uses spirits or beer except very rarely. He has certainly latterly worked hard, often at night by artificial light, and to this he attributes his illness. This is, however, nothing unusual with him, he has ordinarily worked as much, or more, before without inconvenience. Besides, if hard work and strong gas-light had been the cause, these would rather have produced a retinal affection than any central amaurosis, which the present attack bears the stamp of ; and although at first little might have been discoverable with the ophthalmoscope, notwithstanding that the first changes in the circulation might be supposed to be so slight, that they might have escaped observation in the long time which has elapsed since the commencement of the disease, some would, in the ordinary course, have become demonstrable.

The occurrence of the affection almost simultaneously and equally in both eyes, the field of vision being impaired to an unlimited or equal extent, the impossibility of discovering anything morbid in the fundus of the eye on which to base a diagnosis, made me have no doubt that the affection was of central origin, and that this central cause was very definitely localised in the very origins of the optic nerves, as nothing morbid was demonstrable, which could indicate the presence of a cerebral affection. A slightly antiphlogistic treatment was adopted, the patient got sublimate, had Heurteloup's cupping glasses applied periodically to the temples, as well as derivants, whether as simple blisters, flying blisters, or later as a seton in the neck. He subsequently got quinia, with iodide of potassium, subcutaneous injections of strychnia in the temple and around the eye, &c. At first, during the treatment, the weakness of vision steadily increased. In the month of January, 1866 (he came under my care in the middle of October, 1865), that is, about four months after the commencement of his illness, the amaurotic condition had attained its height. He could only catch a glimpse of persons, like shadows, across the yard, which was scarcely more than twenty feet wide. He was not able to distinguish any of Jæger's test-types, not even the largest ; the entire field of vision was, moreover, equally affected : there were no defects in the same. Nothing morbid was discoverable on ophthalmoscopical examination. We might, perhaps, if the cause was central, after the lapse of so long a time, have expected signs of incipient atrophy of the optic nerve ; but nothing of the kind was demonstrable, which I interpreted as a good omen. He continued under treatment until towards the close of spring, when I sent him for a time to the country to improve his strength. During his stay in the country he stopped all medicine, retaining only the seton in his neck. On his return to town he certainly looked better, but on his sight the change had had no influence whatever. The amaurosis was quite the same, nor was anything demonstrable in the fundus of the eye. At this time, as nearly as possible a year after the commencement of his illness, I happened to see Sichel's article upon tobacco, as a cause of such a condition. I now questioned him with reference to his consumption of tobacco, and it appeared that for a series of years he had been accustomed to smoke a large quantity of strong tobacco, ordinary roll tobacco, of which he commonly used two or three skillings[1] worth in two days, which quantity, on account of its strength, corresponds to a considerable amount of ordinary tobacco. He denied that he spat much while smoking. He was now ordered to give up smoking, and, about a month later (he had during this period for a short time used nitro-hydrochloric acid, and had subsequently recurred to the use of strychnia), he began to observe a marked and decided improvement, which has now, after the further lapse of three months, advanced so far that from my window he can read the large letters in a placard at the opposite corner (forty or fifty feet distant), and he can, although with difficulty, spell through No. 1 of Jæger's test-types. More-

1 Arlt, Lehrbuch der Ophthalmologi, 3 B., 1 Hälfte, p. 174.

1 48 Skillings—1s. 8d.

over, the test is now held at more than double the former distance from the eye, about twelve inches. As he is hypermetropic, any shorter distance is now extremely inconvenient to him. Since the improvement commenced it has progressed with enormous rapidity. Latterly he has used only strychnia and quinia. With such progress in so short a time, I cannot doubt that he will completely recover his sight.

From the foregoing, it seems to me that there can be little doubt that the amaurosis was, in this case, due to the patient's abuse of tobacco, and that the improvement which took place cannot reasonably be attributed exclusively to the remedies again had recourse to, and which he had previously used without advantage. Like the increasing number of well-observed cases of nervous affections, of even very serious nature, which have of late years been decidedly referred to the abuse of tobacco, there seems to be nothing unreasonable in placing such obscure cases of central amaurosis also in connexion with the same.

According to Sichel, it is not tobacco employed only in the form of smoke which has this effect, but also in that of snuff, in which, as I have said, Beer also seems to agree. Twenty-eight years experience, he says, has brought me to consider amaurosis to be as frequently the result of the abuse of tobacco as of the constant use of spirits. I have, he says, further, arrived at the conviction, that few men will be able, through a long series of years, daily to consume twenty grammes (two-thirds of an ounce) of tobacco, without at last suffering in their sight and memory. This statement is, perhaps, too sweeping. Much will depend upon the strength of the tobacco. I readily admit that the above may hold good with respect to the roll variety. The external circumstances and relations of the individual must also be taken largely into account, how and when the tobacco is used, whether in the house or in the open air, predisposition, &c. Sichel asserts that he has not seen any case where the injurious effect was chargeable to idiosyncrasy, to the patient's want of practice, to his habit of swallowing the smoke, or of spitting copiously. In none had any dyspeptic or marastic state been previously developed. The individuals on whom Sichel has made his observations have generally been practised tobacco-smokers—strong, powerful people, who had never experienced any inconvenience from the habit until their sight began to suffer from it.

Sichel considers the affection also as being of central origin, a localised affection of more or less importance in the parts of the cerebrum whence the optic nerves arise. He has scarcely ever seen these amauroses combined with congestive symptoms of any importance ; with the ophthalmoscope he has in general found nothing, except occasionally in cases of long standing, an incipient, tardy atrophy of the disk, or some signs of mechanical hyperæmia of the retina, large tortuous retinal veins. His prognosis is in general very good, when the cases are not too old. It is evident that where, under such circumstances, atrophy of the optic nerve has been to any degree developed, there is little to hope.

Sometimes the cases long resist all treatment, sometimes they pass with comparative rapidity into recovery or improvement (that is, after five or six weeks). Where there is not a well marked state of congestion, he advises caution in the use of free evacuations of blood (local as well as general). In the commencement, gentle antiphlogosis, the steady use of evacuants, subsequently, flying blisters to the forehead and temple, and, finally, a more stimulating treatment : strychnia, phosphorus, arnica, and externally exciting applications to the forehead and temple.

He moreover remarks that the use of tobacco and of spirits often go together, and that then these two combine to produce the effect. That spirits, constantly used, may produce amaurosis, is indeed a more recognized fact. I have of late years had many cases of amaurosis from this cause under treatment, and where the patients have had strength of mind enough to refrain from the use of spirits, the result of the treatment has in general been favourable; but, unfortunately, they often want this quality, and for this reason the prognosis should perhaps be more unfavourable in this kind of amaurosis than in that which owes its origin to the abuse of tobacco.

REPORT TO THE REGISTRAR-GENERAL ON THE METROPOLITAN WATER SUPPLY.

By Dr. E. FRANKLAND, F.R.S.

ANALYSIS OF THE METROPOLITAN WATERS FOR AUGUST, 1867.

1 Companies.	2 Date and Place of Collection.	3 Total solid impurity in 100,000 parts.	4 Organic Carbon.	5 Nitrogen as Nitrates and Nitrites.	6 Ammonia.	7 Total Combined Nitrogen.	8 Previous Sewage Contamination (Estimated.)	9 Total Hardness.

Loch Katrine ...	FEBRUARY. Glasgow.	3·28	·256	·031	·002	·041	0	0·3

For the purpose of comparison, I append also the results yielded by Loch Katrine water, as supplied to Glasgow, when submitted to the same analytical processes. The numbers in columns 3, 4, 5, 6, 7, 8, and 9, all relate to 100,000 parts of the waters. The table is to be read thus: 100,000 lbs. of Chelsea water collected on 1st August at the Horse Guards cab-rank contained 25·65 lbs. of solid impurity ; the organic matter constituting a portion of this impurity contained ·274 lb. of carbon. This solid impurity also contained ·217 lb. of nitrogen in the form of nitrates and nitrites, besides ·002 lb. of ammonia, whilst the total amount of *combined* nitrogen in every form was ·226 lb. The above quantity of water supplied by the Chelsea Company had been, after its descent to the earth as rain, contaminated with sewage or manure matter equivalent to 1275 lbs. of average filtered London sewage.

By gradual oxidation, partly in the pores of the soil, partly in the Thames or its tributaries, and partly in the reservoirs, filters, and conduits of the Company, this sewage contamination had been converted into comparatively innocuous inorganic compounds before its delivery to consumers. Finally, 100,000 lbs. of the Chelsea Company's water contained 18·14 lbs. of carbonate of lime, or an equivalent quantity of other soap-destroying ingredients.

All the waters were clear and transparent when drawn from the companies' mains except those delivered by the Southwark and Kent Companies. The constant turbidity of the Southwark Company's water indicates some grave defect in their process of filtration. The Kent Company's water had a slightly milky appearance, and was filled with light-brown floating particles.

ROYAL COLLEGE OF CHEMISTRY,

Correspondence.

DR. LYONS ON ACUPRESSURE AND THE "PIN-TOURNIQUET."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The following simple mode of demonstrating the effects of acupressure in arresting the current flowing through an elastic tube may be worthy the attention of your readers. It has possibly occurred already to the minds of many interested in this novel and valuable surgical discovery which we owe to the fertile imagination of Sir James Simpson. I have not, however, seen any account in print of an equally facile demonstration of this marvellously simple operation. The plan I adopt admits of ready exhibition to a class, and affords abundant facility for the practice of the various methods of pressing the needle, with an immediate demonstration of the desired result—viz., the arrest of the current. All practice on the dead human subject fails in this and other very important particulars. I regret very much that this experiment did not occur to me prior to the reading of Professor Pirrie's very admirable paper on the subject of acupressure, and the important discussion which followed it at the recent meeting of the British Medical Association in Dublin, when many gentlemen very candidly admitted the difficulties they laboured under with regard to the exact details of manipulation in an operation so very simple in practice, yet not free from obscurity, however lucidly described in print or *vivâ voce*. My procedure is as follows:—

Take a bit of vulcanised india-rubber tubing of about one-eighth inch bore, and from twelve to eighteen inches in length. Lay it lengthways upon any cylindrical body two or three inches in diameter; a cylindrical match-box, a little drum made of card-board, or piece of wood or other simple contrivance will answer perfectly well. Next wrap a band of chamois leather, about two inches in width, around the cylinder, thereby fixing the india-rubber tube on the outside of the cylinder, but under cover of the chamois, which may be pined, sewed, glued, or otherwise simply fastened. Such a moderate degree of pressure is to be employed in passing on the chamois leather wrapper as will suffice to keep the india-rubber tube steady without exercising any undue compression of it.

The tube will now sufficiently closely represent an arterial vessel in the human subject of about the calibre of the brachial, while the chamois leather will do duty for the inverting skin and tissues.

To facilitate the further steps of the experiment a pin or acupressure needle may now be passed through the chamois leather at any point over the track of the extemporised india-rubber artery. Any one of the various modes of passing the needle may be selected at will, but the simplest, and one that is certainly as fully efficacious as any other, is that in which the needle is passed through a fold of integumental chamois *over* the vessel, quite through to its own head.

To obtain a current the experimenter now dips one of the free ends of the tube into a tumbler of water, and applying his lips to the other end with a momentary action of sucking, converts the tube into a syphon, and the water as it runs from the free end of the tube may be received into a plate, saucer, or other vessel, taking care to keep the latter or receiving vessel below the level of the water in the tumbler.

The cylinder on which the centre of the India-rubber tube is bound by the chamois may be conveniently held in the left hand, while the right is free to manipulate the needle.

With the needle in *situ* crossing the vessel as above directed, the current continues to flow freely, but is instantaneously arrested, when the needle, moved by its point, is made to pass through an arc of ninety degrees. The partial or complete arrest of the current may be accomplished at will by a variety of other movements of the needle, which the operator can extemporise, such as working it through a horizontal arc, bringing it obliquely across the tube, &c.

If the drum be fixed, as may be done by attaching it to a pile of books or other object placed on the table before him, taking care to proportionately elevate the tumbler or other vessel which contains the water supply, the experimenter has thus his two hands at liberty, and can practice at leisure the various modes of passing the needle, with or without wire loops or thread, now in use, and so fully and graphically detailed by Professor Pirrie and others. It is almost needless to add, that each time the current is arrested by the skill of the experimenter in his extemporised operation, it can be set in motion again by a momentary "suck" at the free end of the tube.

While engaged with the above described, almost toy-like manipulations, I was led to try the effect of the chamois band and pin on the radial and other vessels, and I confess I was surprised at the facility with which the current in the lining artery can be controlled by this extemporized "Pin-Tourniquet" as I propose to call it.

By the use of an elastic band, of vulcanized india-rubber, of pliant leather, of common cloth, and of almost any extemporized material of sufficient firmness and pliability, I believe that with the aid of a properly-handed acupressure needle, or even with a common pin of sufficient size, almost any of the superficial vessels may be effectually controlled.

When from excessive nervous sensitiveness, or other causes, there is any difficulty on the part of the patient as to the skin being pierced, I believe it will be found that in many cases, of lesser wounds at all events, the vessel which requires to be controlled may be fully commanded by the use of the "Pin-Tourniquet" as above described, without perforation of the skin. If this procedure be found sufficient to control the hæmorrhage, it would no doubt still further enhance the prospects of union by the first intention, that great desideratum in the surgery of all wounds by accident or incision.

That acupressure is not free from the danger of injury to the vessel in unpractised hands, will, I am satisfied, be one day shown in the further experience of the operation, and hence I think it will be readily conceded that practice in passing the needle on such a little apparatus as that I have devised, may not be without advantages to the uninitiated. The oozing of water will be a tell-tale safer in result than the escape of blood from a punctured artery. If the difficulties of the situation in actual practice are to be more fully realized in preparatory experiment, one or two india-rubber venæ comitas may be placed side by side with the artificial artery, and different coloured fluids employed to represent the venus and arterial currents.

I have to apologise for the length to which this communication has run, but the great interest which centres in all that concerns this novel and most valuable addition to surgical therapeutics, must plead my excuse.

ROBERT D. LYONS.

8, Merrion-square, West, Dublin,
Sept. 1, 1867.

THE ORIGIN OF NERVE FORCE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me, through the medium of your journal, to introduce to the notice of the Profession a subject which must be deeply interesting to every lover of science. The subject which I allude to is a rather hackneyed one, but, nevertheless, not the less interesting, viz., the origin of nerve force. When I put forward a theory, I do so in the hope that the subject may be taken up by some one more competent than myself, who may work it out more completely, and thus throw some light on this interesting but mysterious department of physiology.

In the first place, then, by way of preface, I shall assume, with Baron Reichenback, that electricity, heat, &c., &c., and I will add *nerve force*, are only modifications or results of the one great force that pervades all nature. Whether we consider the force that keeps the spheres in their orbits (gravitation), or the force which cements the fragments of a piece of marble (cohesion), or, again, the force which unites the elements

of this same piece of marble (chemical affinity),—all, I say, are one and the same, differing only in the circumstances of application, not in the force itself. This I think the more necessary to insist upon, as I know that many try by hair-drawn distinctions to separate what are called the physical forces, and even to prove that statical and dynamical electricity are developed by two distinct powers.

Starting from this, I would say that nerve force results from the interchange of elements during the act of nutrition of nerve tissue itself. We know that this is a chemical process. We know that dynamical electricity is developed by a similar process. We know also that the latter will not be rendered perceptible unless proper apparatus be supplied. Nerve tissue itself affords this apparatus, viz., the grey substance and axis cylender of Purkinje, as conducting medium, and the white substance as an insulating material. I therefore contend that nerve force is merely the result of the ordinary chemical changes going on in the body, which in other tissues give rise to animal heat, and that the peculiar constitution of nerve tissue permits of its accumulation. If my histological and electrical knowledge went far enough, I doubt not that I should be able to trace with more accuracy the striking analogy between the production of electrity and the production of nerve force; and it is to this point that I would earnestly direct attention. That nerve force is, we may say, identical with electricity, has long ago been admitted; and I think that the powerful effect of the application of ice to the spine may be explained by simply supposing a thermo-electric current to be produced by the inequality of temperature.

Hoping that critics will pardon me for bringing forward what they may consider an extravagant notion; and, still worse, if it should happen (since "there is nothing new under the sun") that these ideas have been expressed before.—I remain, sir, your obedient A.B., M.D., M.Ch.

BROWN AND POLSON'S CORN FLOUR.

We are requested to publish the following letter to Messrs. Brown and Polson in reference to statements contained in their advertisements:—

Gentlemen,—I see your advertisement, and I beg to assure you your averments are quite unsustained by facts. Take two children, or say two dogs, feed one on your corn food, and the other on common corn meal. The child, or the dog, fed on the latter will thrive, whereas the child, or the dog, fed on your corn starch, for corn flour it is not, will perish. Corn meal contains all the ingredients of life. Corn starch does not contain all the ingredients of life. As an occasional luxury, indeed, were you only to set it so forth, I should have nothing to object, but as peculiarly fitted for the diet of children, which you assert, corn starch be assured is quite unfitted. The white corn meal, freshly and cleanly ground from good corn, makes an admirable and most nutritive porridge. The yellow meal makes as good nead. Permit me to urge and advise you to transfer your praises to the corn meal, which is really a most excellent and sufficing food, and the great merits of which can, not, indeed, be too widely disseminated.—I am, gentlemen your obedient, servant, Henry MacCormac, M.D.

Messrs. Brown & Polson.

Gleanings.

The Importance to Medical Men of a Knowledge of Languages.—I do not go the length of saying that it is indispensable for the average practitioner to be able to read freely the aphorisms of Hippocrates in the original Greek, but I certainly desire in the strongest manner that some knowledge of this glorious tongue, such at least as will help to solve a historical difficulty, or to follow out an inquiry into the nomenclature and description of diseases, should always be preserved, along with a reasonable knowledge of Latin, as a feature of the medical curriculum. And here let me say a good word for the modern languages, and especially for French and German. Without these languages a physician or surgeon in the present day is not more than half educated. However carefully he may have been placed abreast of the science of the age when at college, he finds in a few years that he is losing ground, and that the progress of inquiry is opening up everywhere new lines of investigation which are practically closed to him because he has failed to provide the key to them in these two languages. There is not a single subject, I believe, in anatomy, physiology, practice of medicine, on which a man could at the present moment fairly say that he has mastered the latest information without a careful reading of some German *archiv* or French journal; and, in fact, I am every day consulted by students and practitioners, to whom I find it impossible to communicate accurate ideas without referring them to such sources of information—which, in too many instances, they declare their inability to consult. To everyone, therefore, to whom foreign languages are not an insuperable obstruction, I would say—avail yourselves by all means of the services of the excellent teachers of these languages in this city, and do so as soon as possible.—*Dr. Gairdner's Introductory Address.*

The Water Supply of Malta.—The excavation for water in the sandstone formation of the Massa Valley, as well as in other parts of the island, has been long practised with success by the natives. Mr. Bateman's suggestion of sinking a shaft through that rock has consequently no claims to originality. There are already several shafts of a like kind in the vicinity of the spot selected by that engineer, and, indeed, one, that of Mr. Scerri, lies within the distance of a few yards of it. It would, therefore, be highly improbable if water to some extent were not discovered in such a locality, not, however, for the reason stated in Mr. Bateman's proposal—the conversion of salt into fresh water by filtration through the rock, or from the sandstone itself being sufficiently porous to act as a sponge, but from the natural reservoirs in the sandstone, caused by the cracked and fissured nature of that rock draining the superficial rains from the neighbouring slopes. Up to the last accounts we have received the excavation had proceeded to a little more than 85 feet; and, although no great quantity of water had been met with, the character of the rock gave grounds for hoping that more would be found.—*Malta Times.*

Pauperism in London.—In 1857-1858, when there was a panic in the money market, and labour was ill employed, 77,660 paupers were relieved in London on one day, and the annual expenditure for the relief of the poor was £867,355; while in the year 1865-1866, when all who could work were actively employed, and labour in great demand, 111,019 paupers were relieved on the same date of the year, and the cost of relief amounted to £976,262 for the entire year. There were, therefore, 33,359 more paupers, and the expenditure was greater by more than £100,000. Nor is the whole truth included in this important statement. The number of persons relieved by the guardians on a particular day affords no real conception of the condition of the lower orders. Such an estimate of pauperism is not the exposition of the sum-total of social misery; it is only the comparative indicator of indigence; for every pauper relieved, four or five at least are living precariously from hand to mouth, and their resources are so scanty as to force them to apply for help upon the least reverse.—*Chamber's Journal.*

Medical News.

Cholera from Rice.—It is stated in the report of the Medical Officer of the Privy Council, that the researches of Dr. Hallier go far to prove that cholera results not merely from a fungus, but that this fungus is nothing more or less than the *smut* or *mould* of bad rice. Now, although the observations which go to prove the identity of the fungus found in choleraic discharges with that existing in diseased rice are certainly novel, the theory that cholera results from bad rice is by no means new. It has been started by various authorities, as may be seen by reference to Dr. Macpherson's "Cholera in its Home," but without any satisfactory demonstration. Dr. Hallier, however, has thrown a new argument into the scale.

Is there Fibrine in the Hepatic Vein?—Some pysiologists say no, but M. Vulpian, in a paper just read before the *Societé Philomathique* of Paris, comes to a different conclusion. M. Vulpian details the results of numerous experiments, and shows that when certain sources of error are eliminated the characteristic clot, which proves the presence of fibrine, may be easily obtained in blood drawn from both the hepatic and renal veins.

FEMALE PHYSICIANS IN THE LAST CENTURY.—It was thought, when Miss Elizabeth Blackwell presented herself to the world of Medicine, that she was a novelty worthy of note, but it seems, according to our contemporary, the *Athenæum*, that this lady had her prototype in the last century. Truly there is nothing new under the sun, and Miss Elizabeth Blackwell is not the first lady leech of the name. In 1737 we find that another Elizabeth Blackwell published her "Herball, containing 500 cuts of the plants most useful in Physic, engraved by her, with descriptions," two vols., London. This book went through some editions, and was subsequently brought out in Germany by Trew, of Nuremberg, in 1750.

NOTICES TO CORRESPONDENTS.

Contributions should be *legibly* written, and only on one side of the paper.

When proofs are forwarded it is of the utmost importance that they should be corrected and returned without delay.

Every MS. should bear the Name and Address of the Sender.

A Registered Practitioner will find full details in our forthcoming Student's Number. He does not specify which examination, or we could reply more fully.

T. C. D.—Your letter shall be inserted with pleasure as soon as we receive your card for its authentication, but not for publication.

MEDICAL APPOINTMENTS.

ENGLISH.

CALTHROP, C. W., M.R.C.S.E., has been appointed House-Surgeon and Secretary to the Manchester Royal Eye Hospital, vice David Little, M.D., resigned.

EDDISON, Dr. J. E., has been appointed Physician to the Leeds House of Recovery.

HALL, F., M.R.C.S.E., has been appointed Surgeon to the Leeds House of Recovery.

MAY, L. J., M.R.C.S.E., has been appointed Resident Medical Officer to the Finsbury Dispensary, Woodbridge-street, Clerkenwell, vice E. Meek, M.R.C.S.E., deceased.

PRANCE, C. R., M.D., M.R.C.P.L., has been appointed Physician to the South Devon and East Cornwall Hospital, vice C. Hingston, M.D., resigned.

RICHARDSON, W.E., M.R.C.S.E., has been appointed Physicians' Assistant at the Manchester Royal Infirmary.

THOMPSON,—M.R.C.S.E., has been appointed Physicians' Assistant at the West Riding Asylum, Wakefield, vice Dr. Fryer, whose term of office has expired.

IRISH.

MATURIN, W. H., L.K.Q.C.P.I., has been appointed Medical Officer, Public Vaccinator, and Registrar of Births, &c., for the Church-hill Dispensary District of the Letterkenny Union, Co. Donegal, vice H. M. Clarke, L.R.C.P.E., resigned.

WARD, Mr. Montgomery Albert, M.B., M.Ch., and ex-Medical Scholar, T.C.D., L.R.C.S.Z., has been unanimously elected one of the Medical Attendants of la Pensione Médicale, Charlemont Street.

SCOTCH.

ROBERTSON, D. M. C. L. A., M.D., has been appointed one of the Examiners at the Royal College of Surgeons, Edinburgh, vice A. Wood M.D., resigned.

Births, Marriages, and Deaths.

Announcements are inserted without charge, and must in all cases be authenticated with the signature of the sender.

BIRTHS.

GOODING.—On the 21st ult., at Bexley-place, Greenwich, the wife of Ralph Gooding, B.A., M.B., prematurely of a daughter, still-born.

SPALDING.—On the 26th ult., at Gorebridge, Edinburgh, the wife of Wm. Spalding, M.D., M.R.C.S., of a son.

GELSTON.—On the 29th ult., at 62, George-street, Limerick, the wife of Thomas I. Gelston, M.D., of a son.

MARRIAGES.

MALINS—OWEN.—On the 6th ult., at St. George's, Dublin, Edward Malins, M.B., of Cradley, Staffordshire, to Mary, only surviving daughter of the laste Henry Owen, Esq., C.E.

CROWTHER—PEARSON.—On the 20th ult., at St. James's Parish Church Congleton, Edward Lodewyk Crowther, M.B., M.S. Aber., M.R.C.S. Eng., L.S.A. Lond., L.R.C.P. Edin., &c., of Hobarton, Tasmania, to Elizabeth Rosaline, second and youngest surviving daughter of James Pearson, Esq., of West House, Congleton.

LATHBURY—STAINTON—On the 27th ult., at St. Mark's, Tollington-park, London, Thomas Arthur Lathbury, Surgeon, of Finsbury, to Mary Agnes, eldest daughter of Anthony Stainton, Esq., of Walthamstow.

DEATHS.

OWEN.—On the 17th ult., George Owen, M.R.C.S.E., of Machynlleth, Montgomeryshire.

FOULDS.—On the 17th ult., at Abbotsford-place, Glasgow, J. Foulds, jun., Surgeon, late of New Prestwick, aged 20.

WILLIAMSON.—On the 24th ult., at Mildmay-park, N., Albert Edward, infant son of James Williamson, M.D., aged 8 months.

TO THE MEDICAL PROFESSION.

George Oldham and Co., Pharmaceutical Chemists and Apothecaries, take this opportunity to return their grateful acknowledgments to the Profession for the support they have hitherto received, and which they will regard as a fresh motive for exertion. Abstaining, either THEMSELVES or their ASSISTANTS, altogether from VISITING or PRESCRIBING, except for the application of Leeches, Cupping, or such operations as are performed under MEDICAL ADVICE, they will continue to devote themselves exclusively to the duties of the pure Pharmacien.

Having had much experience in Practical Pharmacy, sparing neither trouble nor expense to have every article of superior quality, and exercising scrupulous care and attention in the preparation of the various Medical and Chemical Simples and Compounds, the Faculty may place perfect reliance upon the purity of the ingredients employed, and realize from their administration and use the anticipated effects.

☞ Medicines delivered by Vans in all parts of the City and Suburbs, and along the line of the Kingstown and Bray Railway, and in the vicinity of all the Stations, at any hour, free of charge.

Surgical Instruments and Appliances; Home and Foreign Mineral Waters; also every Drug, Chemical, and Pharmaceutical Preparation in use.

MEDICAL HALLS,

107, GRAFTON-STREET, 64, DAME-STREET, AND 1, RATHMINES-TERRACE, RATHMINES.

J. J. Graham and Co. beg to acknowledge with most grateful feelings the liberal and increasing patronage bestowed upon them by the Medical Profession, and to assure them that it is their constant aim to render themselves deserving of a continuance of their support.

J. J. Graham and Co. confine themselves strictly within the limits of the Pharmaceutical Profession, and under no circumstances do they take upon themselves Medical or Surgical duties, other than those performed by the Apothecary under Medical directions—namely, Cupping, Leeching, Blistering, &c.

As the value of a Prescription is completely dependent upon the therapeutic efficacy of the medicines ordered, J. J. G. and Co. are most particular in keeping up a stock of the purest Chemicals and freshest Pharmacopœia preparations. Every article used in the making up of Prescriptions procured from the first Houses regardless of cost, and such as are at all liable to adulteration tested before use; the Profession may therefore rest satisfied that the medicines prescribed will be of the best quality, and carefully compounded under the immediate superintendence of the Principal (J. J. Graham), who resides on the Premises and devotes his whole time and attention to the management, supervising the operations of the assistants, and who is accessible at all hours.

THE MEDICAL HALL, 30, WESTMORELAND-STREET.

ESTABLISHED A.D., 1821.

KINAHAN'S LL WHISKEY.

DUBLIN EXHIBITION, 1865.

This celebrated Old IRISH WHISKEY gained the Dublin Prize Medal. It is pure, mild, mellow, delicious, and very wholesome.—Sold in bottles at 3s. 8d., at the retail houses in London; by the Agents in the principal towns in England; or, wholesale, at 8 Great Windmill-street, London, W.—Observe the Red Seal, pink label, and cork branded "Kinahan's LL Whiskey."

Lecture.

CLINICAL LECTURE ON CASES OF SO-CALLED HYSTERICAL DISEASE.

By C. HANDFIELD JONES, M.B.Cantab., F.R.S.
PHYSICIAN TO ST MARY'S HOSPITAL.

(Continued from page 214.)

BUT when the above position is conceded it remains unquestionably true that in the great majority of cases the convulsive paroxysm is the direct result of indulged emotion, though occasionally the impulse to the passion may be so strong and natural, or the nerve power may be so enfeebled in the controling centre, that the patient may be held quite innocent of voluntarily yielding herself up to it. I quite agree with Mr. Carter where he says that "paroxysms of the primary and secondary kinds may often be induced by the operation of an exciting cause, so powerful that no effort of the will would be sufficient to prevent their taking place, even if it succeeded in delaying them for a time. But such cases are rare, when compared with those in which the occurrence of the fit, although not volitional, is yet a matter of surrender, and might be prevented under the pressure of an adequate motive." He gives, at p. 47, an amusing illustration of this, which is matter of common experience. The following case may find its place here, as affording a good example of the effect of involuntary emotion in giving rise to hysterical phenomena :—

CHOREA PARALYTICA: APHONIA: EMOTIONAL DISTURBANCE: GRADUAL RECOVERY BY AID OF TONIC TREATMENT.

Case 1.—E. K., female, æt. 6, admitted July 3d. She had been ailing three weeks, was quite well before. Complained at first of pain in legs and arms, as the pains went away (her mother says) she got so curious in her movements, her hands always on the work. The last fortnight she has been quite unable to stand, but she can move her legs. Has frequent fits of passionate crying, in one of which she is now when her mother has come to see her, while a few minutes ago, while I was sitting by her, she was quite cheerful. Since she has been ill, scarcely speaks at all, could talk quite well before ; is not anæmic ; heart's sounds normal ; bowels costive ; appetite has been bad, is better now ; no muscular jactitations ; two younger children are healthy, and the parents also.

5th.—Improving ; is quite tranquil when I speak to her, but falls into a paroxysm of agitation and passionate crying when immediately after her mother came to see her. This could not have been from fear, for her mother seemed to be a good, kind parent, and had brought her a box of toys.

7th.—Was more agitated, and crying yesterday when thunder occurred.

14.—Cannot, or will not, stand ; does not move in bed, and passes most of her evacuations under her ; does not cry now except for a short while when her mother goes away. Tr. nucis vomicæ was now added to the citrate of iron and quinine she had been taking before.

August 8.—Is now greatly improved, is lively, talks, and moves about ; same treatment ; went out well. There can be no doubt that this was, *au fond*, a case of chorea, though the characteristic jactitations existed only for a short time. They were then replaced, as is often the case, to some extent, by paresis of the motor apparatus, especially as it would seem of the centres of innervation to the lower limbs and tongue. The emotional centres, however, were markedly hyperæsthetic, the general nerve debility assuming, in this situation, the same modification that it often does in the peripheral nerves. The paroxysms of agitation and crying appeared to me, as I witnessed them, of truly hysterical character, and were evidently the result of emotion, though of a pleasing kind. It is plain that there was no irritation proceeding from the sexual organs in this young child. The disorder was essentially one of the nervous system, a state of neurolysis, which yielded to the steady employment of iron, quinine, nux vomica, cod oil, and cold bathing.

Secondly.—As regards the non-paroxysmal phenomena, I believe the very same holds good. There are cases, and they are common enough, in which symptoms, apparently just like those which are commonly called hysterical occur, under circumstances which make it certain that they have no connection with emotional or mental excitement, but are simply the results of physical derangement. The three cases which I shall presently narrate are instances in proof, and many more might easily be added. Dr. Palmer's case of functional aphonia (*vide* Lancet, 1866, Feb. 16) may be adverted to as one, which, had it occurred in an enfeebled anæmic needlewoman, would surely have been called hysterical ; but as the patient was a labouring man, who lost his voice after a hard day's work, and regained it after a night's rest, and the aid of eight pints of porter, I presume the term will be considered inappropriate. The following histories relate to patients who have been recently under my care in the hospital, and about each of whom I have felt more or less doubt for some time, whether they were fit subjects for treatment by drugs. Yet, as the event has proved they were, the details are worth your attention, for you are certain to meet with similar cases yourselves.

PLEURODYNIA: APHONIA: NEURALGIA OF HEAD: HISTORY OF MALARIOUS DISORDER: TONIC TREATMENT: GREAT IMPROVEMENT.

Case 2.—E. A., female, æt. 38, single, admitted Feb. 16, 1867. Tall, slight, hair quite grey. Has been ill one month ; had first swelling of right knee, after that she got bad cough and pain in left side, which she has had a week. On admission she presented all the signs of a highly marked neurotic diathesis, tremor of the eyelids, aphonia, and panting hurried respiration ; skin cool ; pulse weak. Careful examination of the left side detected nothing morbid, the air was heard entering the lung fully without rale or friction. I was averse to taking her in, as I feared she would prove an unsatisfactory patient, but was overruled. Liq. opii. sed., ℥x., was injected subcutaneously into the left side, and she was ordered potassii iodidi, gr. ij. + ammoniæ carb., gr. iv. + tr. valerian, ʒi. + inf. valerian, ℥i. *ter die;* linim. bellad. lateri ; port wine, 4 oz.

18th.—Is much the same ; has a most woe-begone nervous aspect ; not suggestive to me of real suffering ; face flushed ; voice very whispering, but easily audible.

March 6th.—Has regained her voice ; is sitting up ; has been faradized once or twice. Called out sufficiently loud to be heard across the ward this morning on being told that if she did the faradization should not be employed.

9th.—Suffered very much yesterday from neuralgia in the head, confined to the right half of the head and face ; speaks audibly ; asks for iron and quinine, which always does her good. Ferri et quinæ citratis, gr. x. + spt. œth. chlor., ℥xv. + aq. ʒi. *ter die.*

12th.—Is better ; gets stronger ; the neuralgia is nothing like so bad as it was. She always has it, more or less. She gave me the following history of her previous illness : —Her hair turned grey at the age of seventeen, or rather began to, before this time she had typhoid followed by rheumatic fever. Of late years has suffered much from low fever ; had it much last night ; her tongue was quite parched. In these attacks of low fever her skin gets very hot and rough, and afterwards she perspires a great deal ; they make her very weak. They occur on and off all the year round. She was at Blackheath when the low fever commenced ; lived there fifteen years. In 1851, while at Blackheath, she had so-called congestion of the brain ; used to be light-headed every other day for a week, and then had low fever for nearly three months after. Is always better when taking iron and quinine ; she always resorts to it as long as she can afford to purchase it. Cod liver oil has also done her a great deal of good. She went out about a week after, very fairly well ; her voice was rather

weak, but not more so than that of many persons; her neuralgia was in its usual amount. I have omitted to mention that during the first week or ten days of her stay in the hospital, she lay continually, or almost continually, in bed half asleep. Subsequently she had no unusual drowsiness. I believe in thus yielding to her desire for repose, she took the best means for enabling her exhausted nervous system to recover strength. The aphonia in this female was plainly the so-called hysterical. But was it owing to want of will, or want of power? Some may think that the fact of her finding her voice under the stimulus of the wish to escape the faradization, is sufficient proof that her will was defective. I do not think that admitting this motive to have had some effect, she is thereby, in any degree, convicted of malingering any more than any of us would be who declined to move when we were very tired, but nevertheless started up and ran out of the house on hearing a cry of fire. There is no question (unless we disbelieve her tale altogether) that she had suffered for a very considerable time from a most wearying and enfeebling malady, chronic, obscure, remittent fever, with its attendant neuralgia, and that she improved very materially under an appropriate treatment. She had a bodily disorder, which was amended by physical agents, and I think it would have been sheer cruelty to have pronounced her a malingerer, and refused her the restorative remedies, which she herself asked for, from former experience of their good effects. I have recorded the case just as I took the notes at the time, and I am free to confess that my opinion of her was much modified, as I came to know more of her story. In another case, *apparently* very similar, faradization had no good effect whatever. The patient struggled a great deal, but I could not get her to utter a sound, and when it was repeated subsequently, she refused to attend any more. Here, I do not doubt, defect of will and not of strength was the real hindrance.

EXHAUSTION: FACIAL AND ABDOMINAL NEURALGIA: TONIC TREATMENT: RECOVERY.

Case 3.—J. E., æt. 39, married, thirteen children, admitted, March 30, 1867. Has been ill five weeks. Violent pain came on at first in both sides of abdomen, and in lumbar region of spine, and has continued ever since; is always the same; is not increased by light food; the pain goes down the legs to the knees and ancles; is increased by moving, and, she says, by pressure, but she allows me to handle the abdomen pretty freely, without her face indicating much pain. Only cares to lie quiet. If she puts herself out in the least, the pain becomes much worse. Does not sleep well; tongue pretty natural; bowels open; appetite lost; no thirst; skin cool; urine generally pale; pulse small, weak, 90. Her last confinement was six months ago; she only nursed one month this time, from failure of her milk; generally she has nursed fifteen months. Has had rheumatic fever three times, and much neuralgia of face. She was ordered ferri et quinæ citratis, gr. x. + tr. nucis vomicæ, ℥x. + spt. æth. chlor., ℥x. + aq., ℥i., *ter die*. Port wine, 8 oz. Her improvement, especially at first, was very slow, and her reiterated complaints were for some time sufficiently discouraging. Perseverance, however, in tonic treatment, brought us through; by May 8, she was almost entirely free from pain anywhere. Soon after she went out, and after a month's stay at the Walton Convalescent Asylum, she returned in very fair condition. She had no neuralgia then, but only some leucorrhœa. The tonic remedies were varied a good deal; she took pretty full doses of quinine, liq. potass arsenitis, ferri carb., and valerian + ammonia. Great temporary relief to the abdominal pain was afforded by an enema containing tr. opii + tr. assafœtidæ. This patient was evidently quite exhausted by her proletarian exertions, and her system was precisely in that condition which favours the invasion of neuralgia. There was nothing, therefore, surprising or extraordinary to me in her symptoms, yet, with many, I have no doubt the disorder would have ranked as hysterical colic, or pseudo-peritonitis, and the idea would not have been entertained that the cause of the malady was really failure of nerve power, and that a cure was to be obtained by steady persistence in strengthening remedies.

Case 4.—M. S., æt. 28, single, female, admitted June 26th, 1867. Has had rheumatic fever four times, has been ill as at present six years, the disorder has diminished at various times before, but has now been severe since last January. She suffers in the following manner:—While in bed at night she wakes up with loss of sight, or hearing, or speech; has lost the two former faculties simultaneously, but not the three together. The first time she was attacked she became blind, and remained so twenty-eight days. The blindness, as well as the other anæsthesiæ usually continues twenty-four hours. She does not feel bodily ill at these times. Sometimes, also, she loses (at night) the use of her left arm or leg which become rigid. Except on one occasion the affection of the limbs has always occurred apart from that of the sight, hearing, and speech. A sudden fright will bring on the disorder of the limbs, but not that of the senses. Always has pain in head, chiefly on the left side. The left knee at present is fully flexed, and if I attempt to straighten it the flexor muscles immediately contract more strongly (as if voluntarily), and she complains of much pain. Pulse 84, steady, and regular; appetite good. Has brought up in mornings a small quantity of clear blood. Potassii Bromidi gr. xx + M. Camph. ℈i. *ter die*.

27th.—The contraction of the leg has quite disappeared to-day.

28th.—Complains of headache; yestereven the lower jaw dropped very much, she could not close her mouth; her cheeks and eyelids were also drawn down; large drops of perspiration stood on her forehead, she had a kind of tremor all over, but was quite conscious. This state of things lasted half-an-hour.

29th.—No recurrence of disorder. Shower bath on alternate mornings; urine sp. gr. 1019, is free from albumen.

July 1st.—Her left arm got stiff about two A.M. yesterday, but recovered about eight P.M., it was agitated with clonic movements while it was recovering. Likes her shower-bath.

3rd.—Her jaw dropped again last night, and she lost her sight from nine P.M. to eight A.M. this morning; her sight returned while she was in the shower-bath. She affirms that at these times she cannot distinguish light from darkness.

10th.—Is doing well; no returns of disorder; asks to have her shower-bath every morning; ordered so.

13th.—Is doing well; has some backache only. Pot. Bromidi gr. x. + Tr. Cinchon. ℥i + Aq. ℥i *ter die*. I learned to day, for the first time, that she had a sudden fright six years ago, from the sudden death of a person, a cousin to whom she was much attached, probably her *fiancé*. This occurred in January, and in March her attacks came on.

17th.—Continues to do well; is better than she has been for a long time; went out soon after.

When I showed the notes of this case to a well-instructed physician the word hysterical was on his lips immediately, and the same impression existed in the mind of my very intelligent clerk, Mr. Palk. For myself, I doubted. On the one hand, the apparent voluntary action of the flexor muscles of the contracted limb looked suspicious; on the other, the symptoms were much less persistent than one would expect them to be, and than I had known them to be in a previous instance. The rigid contraction, indicating an excited state of the motor centre, suggested the use of the bromide. From it, as also from the shower-bath, much improvement evidently resulted. I was not acquainted with the probable cause of the malady until she had been more than a fortnight under my care, or I should have felt less doubt as to the real nature of the case. It is well-known that permanent insanity (dementia) has resulted from a similar mental shock. A case of fatal chorea occurred under Dr. Chambers' care, at St. Mary's,

which depended, I believe, on a like cause, and Bamberger relates a case where convulsions, paresis of the limbs and death, were produced in the same way. To class such sufferers with selfish malingerers seems to me opposed to common sense and justice. The latter have never been scathed by any terrible stroke, they can show no adequate cause for their symptoms, they exaggerate their troubles, and being by no means anxious to be freed from them derive no real benefit from any remedies. No true hysteric patient I ween would express her liking of a shower-bath, and ask to have it every day.

Lastly, all men of experience must agree, that not unfrequently all the manifold phases of hysterical disorder are more or less wilfully, and of set purpose simulated. Abundant instances of this kind are on record, and we have certainly only ourselves to blame, if forewarned we are not forearmed. Let me remark, however, how the old adage, that "naturam morborum remedia ostendunt," is verified here. The success of such moral treatment, as Mr. Carter has so excellently described in his work, and carried out in practice, proves absolutely that the disorder in such instances is not of material origin; while vice versâ, I may fairly argue that where drugs and ordinary hygiene avail without moral treatment, the body is much more at fault than the mind.

But you will ask me how are we to distinguish the one class of cases from the other, how are we to recognize those whose disorder is chiefly physical, and those in whom it is mental. In some instances there is no difficulty, in others it is no easy task. You must look to the patient's history, you must try to ascertain under what circumstances the disorder has come on. You must note whether she has suffered in mind or body, whether she has been depressed by prolonged anxiety, grief, care, or any other mental trouble. You must enquire whether she has been debilitated by menorrhagia, hæmorrhoids, over nursing, some recent acute illness, malarious influence; whether there is reason to think that a toxic condition of blood, such as gouty, or some remote irritation, intestinal, uterine, or ovarian, may be vexing and depressing the nervous system. You must note whether she can take thought for others, or whether she is utterly selfish and absorbed in her own troubles. You must observe whether she has an ear for the call of duty, or only for that of pleasure. You must not be too harsh in your judgment even when circumstances may look rather suspicious, especially when you are dealing with the overstrained and overworked, whether in high or low station. Remember that sympathy under suffering is naturally and lawfully desired by us all, and that it may be hard for you to appreciate the amount of distress which another may be enduring. The Psalmist, writing prophetically of the purest and noblest that ever wore human form, makes him say—"I looked for some to have pity (margin, to lament with me), but there was no man, and for comforters, but I found none." If He, the sinless one, felt this need, much more may we. So long as the desire does not warp the moral sense, and lead to downright selfishness, or wilful deception, we should lean in our judgment to the side of charity. But when once this limit is passed, and we feel that the patient is no longer trustworthy, we may and ought to suspend medicine, for otherwise we become, as Mr. Carter tells us, most helpful accomplices in her impostures. The most difficult cases are those (and they are far from being infrequent), where there is unquestionably bodily disorder as well as mental, and it is a hard matter to discover whether the latter is or is not (as it surely may be) dependent on the former. Here we must watchfully observe the effect of physical and moral agencies, and according as the one or the other avail, must we frame our judgment of the individual case.

I conclude this lecture with the earnest counsel that you will not allow yourselves to call all cases of obscure and anomalous nerve disorder, hysterical. The term is unquestionably often used to denote unreal, imaginary, self-produced, or encouraged illness, and to such cases I would have it restricted. Other more frequent cases would be better designated as neurolytic, an epithet which I proposed many years ago, and which has the advantage of expressing a fact, without affirming anything as to its causation. I may add that you will find in a little work recently published by Dr. de Berdt Hovell, views which go still further in some respects than mine.

Original Communications.

SURGICAL COMMENTARIES:

INTENDED AS A DIGEST OF THE AUTHOR'S PRINCIPLES AND PRACTICE, AS ILLUSTRATED BY THE MORE IMPORTANT SUBJECTS OF SURGERY.

By GEORGE MACILWAIN, F.R.C.S., Etc.

AUTHOR OF "MEDICINE AND SURGERY, ONE INDUCTIVE SCIENCE;" "THE UNITY OF THE BODY;" "DISEASES OF THE MUCOUS CANALS OF THE BODY;" "STRANGULATED HERNIA;" "LIFE OF ABERNETHY," AND OTHER WORKS.

ON CERTAIN RESEMBLANCES BETWEEN PHENOMENA RESULTING FROM MECHANICAL AND CHEMICAL, OR POISONOUS OR OTHER FORCES, AS SUGGESTIVE OF SOME LAW IN COMMON.

Most men engaged in scientific research, feel that the various facts connected with the subject of the co-relation of forces, afford a prospect of some higher generalization than that to which men have yet arrived. Such a multitude of facts point so suggestively to a common force, that the obscurity which at present, seems to shroud various forces, as electricity, magnetism, light, heat, &c., in certain peculiarities is very probably about to be removed. I think medical science would promise an equally rich fruition, were it cultivated with the same rigorous observance of the rules of logic and induction.

I have no idea that in these sketches I shall inspire any reader with my own enthusiasm. The induction of facts is tedious, but I will make them as suggestive as I can, by stating them exactly in the order in which they engaged my attention.

The subjects with which I commenced my investigations, (now a great many years ago), were the so-called Syphilis, and the popular remedy for it, Mercury, with a view to ascertain, if possible, the nature of their relations to each other, and the phenomena which appeared to be sequences on their administration. It is, perhaps, as well that we should look back for a moment on the state of certain questions as they stood at the time of John Hunter, and some years subsequent thereto. John Hunter seems to have considered the action of mercury chiefly in relation to syphilis. For this disease it was looked on as the proper remedy or even antidote, for the antagonism, as supposed, between these poisons or forces, or by whatever name one chooses to designate them, was so complete, that mercury was in the main regarded as a test of the presence of syphilis so that if a given case did not yield to the action of that mineral, it was scarcely regarded as the disease for which it had been administered.

There were not wanting, however, persons who at that time were dissatisfied with such views of the matter; cases occurred in which mercury had not only been unsuccessful, but in which it appeared to have been injurious; cases too, which had, from their history, been regarded as unquestionable examples of syphilis. Then, again, mercury had appeared to be injurious in persons in whom it had previously been apparently beneficial. Again, cases occurred indistinguishably simulating syphilis, but under circumstances which seemed prohibitory of the occurrence of that disease, without some hypothesis too violent to be entertained with any approach to probability.

John Abernethy early distinguished himself by the observation of these and many other phenomena, and very soon instituted, with his characteristic discrimination, a

more cautious and circumspect practice. In one respect this was a very important step, because in the practical distrust of the prevailing impressions, it afforded opportunity for more discriminative observation. This led him to the fact, that however undistinguishable from syphilis certain cases might be in their external phenomena, they neither occurred under circumstances justifying the idea of the presence of that poison or force, nor did they require mercury as it had been ordinarily administered for their cure. Now, to these cases he gave a simple, and at first sight, the apparently unobjectionable name of pseudo-syphilis.

But perhaps, after all, it was an example of infelicitous nomenclature. It implied something like a recognition of the alleged relations of syphilis, and thus leading men to satisfy themselves by thinking of *modifications* of this or that form of disease, seemed to answer a question without really doing anything positive towards the solution of it. It thus rather perhaps tended to retard the very inquiry it was so admirably calculated to hasten. This effect was perhaps further ministered to by Abernethy's treatment, including (notwithstanding a more cautious and investigating conduct of it), the same remedy, viz., Mercury. At the same time, there were many persons, who, however exceptional the number, their character, their motives, or their influence, early denied, or professed to deny the necessity of the use of mercury at all in the cure of syphilis. These people, usually very astute, and with no ordinary appetency for money, have sometimes in their reckless experiments, anticipated facts, which were necessarily more slowly developed in the tardy results of the more cautious and conscientious practitioner. For, to say nothing that many points of knowledge have been hit on by accident, not a little of anticipative observation has arisen from the too common habit or tendency to determine that what we cannot do, is impossible, in other words, that our present powers in combating disease, constitute a kind of *ultima thule*, a conclusion, when so stated, in which few would at any time be bold enough to indulge.

In this state of things, my public duties (which involved very extensive responsibility), obliged me to consider the whole subject, whilst they presented me with very extensive opportunities of so doing. It immediately occurred to me that the objects of research were in a state of great confusion. That a tendency to reason on certain abstractions seemed to prove every body right, or every body wrong, just as the measure of individual experience led them to determine.

It was, however, important to observe that, although the use of mercury had become somewhat moderated as a remedy for syphilis, it was very largely administered in inflammatory affections, where there was no idea of syphilis whatever. Now, these cases were the first that drew my attention, and awakened a new interest in the subject.

I found, in fact, that some of these cases were followed by phenomena identical in appearance with those which were held to be characteristic of syphilis, and in cases, in which at no period had the history afforded any reason for supposing the existence of syphilis in any form. I had at one period no less than six examples of this kind under my care, and I stated the fact at the Philosophical (now I believe called the Abernethian) Society of St. Bartholomew's Hospital, in order that gentlemen who felt interested in the subject might see the cases for themselves. This struck me as a very important fact. The circumstance that two apparently unconnected influences should produce phenomena undistinguishable from each other, suggested that they might produce similar disorders in the system; but at that time I did not venture farther than that conjecture, but I soon found examples proving the fact; but I have no space for cases.

Now, here I would desire my reader, in order to our understanding the matter, and each other clearly, to bear in mind:—

1st. That two forces, or poisons, or influences, may induce phenomena, which in their external and visible signs are not distinguishable from each other, without justifying the conclusion that the forces are identical in their intrinsic nature.

The only safe conclusion from *those premises* being that the one common property they have is simply that they are injurious to the body.

On the contrary, many very familiar examples might be quoted of disease, where very different external appearances occur under the same law.

So that, in fact, no *identity* of external appearance is to be held as necessarily identifying the force whence it is produced, nor any *variety*, that it necessarily occurs under a *different* law.

At this period I occupied myself a good deal in thinking over the writings of Mr. Hunter on the subject of the sympathies of parts, and began to deduce the practical conclusions which I have sketched in the commentaries which have preceded this, and especially the importance of acting on primarily affected organs, of which I shall, by and bye, have more to say. Various cases led me to act on different organs, and in many the organ selected was the liver. In endeavouring to act on this organ so as to induce secretion from it, I tried to prescribe so that the medicine should pass slowly through the duodenum. I did this from having observed cases in which gentlemen sometimes told me that they did not think there was any congestion or torpor in the liver, because certain medicines usually given for that purpose had produced no evidence of it. Now, in these cases, I obtained very satisfactory evidence of torpid liver, and great benefit from *ordinary* means, so managed as to act slowly. It appeared to me in the cases in question, that the medicines, before given, had been eliminated by the bowels, and so had not acted on the liver at all. This view led me to think that many other things might do as well as mercury, so I occasionally employed ordinary aperients, and endeavoured to render the action of them slow, sometimes by combining them with small doses of hyoscyamus, confection of opium, or other sedatives, or with aromatics; in others giving them uncombined, but in very small doses, night and morning, or thrice a day, according to circumstances.

Abernethy always preferred giving aperients in graduated doses, but with another intention. He used to say it was the most philosophical way, as it enabled you to adapt the means to the ends you desired to produce. Well, in giving aperients, combined as I have said, sometimes the sedative might be in too great a dose, and require some further measure to carry out the medicine or the secretion it had excited, or both. The retention of either, of course, was to be avoided. Every one is familiar with that portean form of discomfort from the retention of anything which is intended to be discharged, and nothing is more mischievous than the retention of excretions. I found, now, that salivation might be excited by other things besides mercury, and this occurred in one case from scammony, and in another from aloes. This suggested to me that mercury might not derive the power which has been held to be so characteristic of it—viz., producing salivation from any specific property inherent in it as *mercury*, but simply in virtue of some property which, however different in the abstract from other poisons, might have the common character of being injurious to the œconomy. This view was somewhat strengthened by the recollection that mercury itself does not, *as the rule*, readily salivate, unless by some means factitious or other it is retained, or otherwise impeded in its passage through the body.

About the same time I was sent for to a drayman, of about thirty-three years of age, who went to bed, as reported, as well as usual, and awoke, after a cold night, with two of his fingers quite dark, and as the event proved, mortified. When I visited him I found him enormously fat, with an apparently very full liver, and in a state of salivation. He had nothing the matter with him besides, and had taken no mercury nor any other medicine.

One of the fingers sloughed, the other only I think to the last phalanx. I need not say that I was particular in my

enquiries, and the more because the *odour* was mercurial, but I know now that may take place without mercury. Ultimately, he did very well by light diet, and relieving his liver and bowels. I know of another case, where the sloughing of two or three of the fingers was coincident with congested or perhaps diseased liver in a dignitary of the church. Reflecting on these and other cases, it seemed that the retention of a poison, or anything in the body, which ought to be expelled from it, lay at the bottom as it were of a multitude of phenomena, which must be subject to some common law. Nor was such suggestion, as it appeared to me, at variance with many subsequent phenomena which my opportunities furnished. Dr. Golding Bird called me into a case of Tetanus, to open an abscess in the finger, which he seemed to regard as the cause. I rigidly enquired into the man's history, and found as I thought the state of his system, to which this extraordinary result was owing, and here I would observe that I use the word *extraordinary* because it is not apparently weighed, I think, as demonstrating some different condition of body ; all people thus affected by traumatic tetanus, as it is termed, have had wounds many times without any such result. Well, Dr. Bird allowed me to treat the patient in my own way, by acting on his liver and other secretions, but with every *painstaking* I could think of, to avoid *any irritation* to the mucous membrane of his bowels. The result was that the tetanus subsided, and then Dr. Bird suggested my opening the abscess, but this I begged of him not to press, for, said I, in the view of some people it will spoil the case. The abscess therefore, was allowed to make its way to the surface without interference. I considered this and many other cases with reference to the general production of muscular spasm, and with an endeavour to connect spasms of more ordinary occurrence, as those incident to worms, chorea, cramps, and soon, with the less frequent, as those of tetanus, and the following description : I was called on to pass a bougie in the rectum of a woman about 35 years of age, when she was siezed with a severe attack of opisthotonos. She had suffered no pain from the instrument, nor did she appear alarmed at its introduction, nor was there any other circumstances admonishing me of the approach of any unusual symptom. She was strongly bent forward, and was about a quarter of an hour or twenty minutes in recovering from it. I need scarcely say, that the bougie was withdrawn on the occurrence of the spasm. I have met with another case far more remarkable and more severe: A tall lady was seized with the most violent opisthotonos, no other exciting cause than placing the hand gently on epigastrium. In this case the head was bent back with such violence, and the body was acting on the bed with the power of so long a lever, that I was obliged to raise her *en masse* from the bed, which required all the strength I had. I was really fearful that she would have injured the neck. This was witnessed by a lady who was present, and who had seen this kind of attack on other occasions.

Now, these and similar facts strengthened the idea that poisonous and all other injurious influences acted under a common law, and that so long as they fell within that limitation of power of resistance of the body, or in other words, so long as they were not in such force as at once to destroy ; that the varying effects in different persons, or the *ordinary* similarity of effects were due, not to the intrinsic difference of the material or poison, but the varying or similar conditions under which they were administered. That the common resource or remediable action, when that was within the power of the œconomy, was secretion, and that moderate affection of the voluntary muscles was simply a result of injurious influences acting on the nervous system, whilst the power of secretion was either destroyed or held in temporary abeyance. This was the state of my views when I met with a book published by M. Morel—"Traité des Degenerscœnces physiques Intellectuells et Morales de l'espece Humaine." In this book, written with an entirely different object, a great number and variety of facts are recorded, which are not only of very high interest as regards the learned author's particular object, but very pertinent also to our present enquiry.

I have no space to quote largely from M. Morel's ingenious work. I can only refer to the general result which I gather from his interesting discussion as to the effects of various kinds of poison of damaged corn, as ergoted rye, and others. He remarks on alcohol, opium, tobacco, lead, mercury, &c., that, with acknowledged differences in the effects of these poisons, they terminate, after a certain exhibition of force, in manners very strikingly resembling each other. After observing that the action of unwholesome food ("substances alimentaries viciées"), is the more special object of his researches, he says, with reference to the history he gives of various poisons—"L'action exercée sur le systeme nerveue par le mercure, le cuivre, le phosphore, et l'arsenic n'entrera en ligne de compte que pour mieux faire ressortir, certaines analogies etablies les bases du diagnostic differential, et prouver, que les maladies que vu la nature de la cause offrent des symptomes primitifs essertaellement differents presentert neanmoins dans leur terminaison des points de rassemblances tel que l'onpeut pour ainsi re considerer ces affections comme appartenants a la méme entité pathologique," p. 202.

I can only refer the reader who desires to go further into the subject, to consult M. Morel's interesting work. No doubt the impression of the importance of the point of view whence he looks at the various injurious influences of which he treats will be very much modified by the previous studies of his readers; but to those who have given some attention to the degrees which certain conditions of the body will, with certain limitations, modify the effects of injurious influences; and to those who have traced sympathetic phenomena, not only the general sympathies exhibited between mind and body, but also in the relative preferences of different organs of the one with certain faculties of the other, the book must not only, I think, be very interesting, but highly suggestive. With regard to injurious influences, it seems to me to impose a very salutary caution on any endeavour to restrict their individual peculiarities. For it would seem that, though to a certain point, there is something characteristic, there is a tendency beyond that to merge as it were into a series of phenomena strikingly similar, and yet not of such force as to be necessarily destructive. When we see a simple passage of a bougie producing Tetanus however temporary, in one case, the application of the hand to the epigastrium in another followed by an alarming attack which could only be described by terms almost identical with those applied by M. Morel to a case under the influence of lead, and then compare them with the phenomena resulting from strychnia, and the multiform cases of tetanus, and other disturbances of the voluntary muscles ; it strongly suggests that there is some general law under which we shall be able to marshal these phenomena more intelligible and instructive than any of which we are present in possession.

I have no disposition to speculate on this subject without further enquiry; but thinking aloud, as it were, with my readers, it seems to me first, that the great safety valve of every desturbing influence, no matter of what kind, is secretion. I think this is universal, that whether we weep from sorrow, or from mustard, that as regards the eye the law is the same ; in the one case it relieved the vessels of the eye from an irritating stimulant, in the other the vessels of the brain *per tárto*, by determination to surface.

That the retention of anything in the body which is not necessary, whether foreign to it, in the ordinary sense of the word, or that which should be excreted is the common basis of mischief, and that spasm of the voluntary muscles seems the necessary result of that retention unless secretion be continued with a given force. In short, that in the body as outof the body, every force must do some-

thing, and if it be applied to a living body it must be expended in the *ordinary* work of that body; or if it is to be innocuous it must be expended in secretion. I think the phenomena of disease seem to bear me out in this, but I speak with caution. This is nowhere more necessary than in relation to mercury and syphilis, on which I propose to record a few observations in the next commentary.

THE SPINAL ICE-BAG IN CEREBRO-SPINAL INFLAMMATION.

By JOHN MORGAN, F.R.C.S.I.,

PROFESSOR OF DESCRIPTIVE ANATOMY TO THE ROYAL COLLEGE OF SURGEONS OF IRELAND.

THE following case I conceive of interest, as it tends to show the value of the spinal ice-bag of Dr. Chapman in the treatment of cerebro-spinal inflammation.

A lithe and hitherto healthy boy, æt. 9, was admitted at 4·30 A.M., Aug. 27, 1867, to Mercer's Hospital. His parents state that he was a little ailing the evening previous on going to bed, and shortly after became restless and rambling, picking at the clothes, and in fits as they describe. The symptoms so increased in intensity that early in the morning he was brought to hospital. The raving was now incessant, but he was capable of obeying when repeatedly desired, putting out the tongue rapidly and with a jerk of the muscles; face rather flushed; head retracted; sterno-mastoid muscles tense; no dysphagia; muscles of trunk and extremities moderately rigid, but becoming more so on slight pressure, though not by pressure over spine; surface warm, and on examination a curious blush was distinct over the lower half of body, having the appearance of a capillary excitement of the skin, and not of a rash. Pupils enormously dilated and quite insensible; there was one attempt at vomiting; belly slightly tumid; pulse 120; tongue clean and moist. An ice-bag not being at hand cold effusion was used over the head and occiput, with rather tranquilizing effect; turpentine enema with fœtid tincture administered; and hydrarg. c. creta, gr. ij., pulv. jalapæ co., gr. xij., every two hours; turpentine stupe to the belly.

Eleven o'clock.—There is now more distinct tendency to spasmodic action of the muscles of a tonic nature, the pupils being observed distinctly to dilate more at the approach of a spasm; three suspicious purpuric spots on one, and two on the other arm are now seen; a large sized ice-bag was now charged with ice and salt, and applied along the spine from occiput to lumbar region; the immediate effect was contraction of the pupils, though not to their normal size; diminution of the spasm and restlessness, and what was remarkable, of the blush over lower limbs; belly is rather tumid; ice-bag to be refilled at two hours interval.

Evening visit.—Tension of muscles rather less; pulse 108; blush of lower limbs disappeared; bowels but once freed; ordered olei crotonis. gtt. ss., calomel, gr. iv.; continue ice-bag at two hours interval.

August 28th, nine A.M.—Slept none; delirium and restlessness constant; the arms at times rigidly stretched out; twitching of the muscles of face, which is now rather pale; pulse 100, weaker; tongue moist; pupils still dilated; muscles not so tense, and certainly relieved on each refilling of the ice-bag; the belly still rather tumid; bowels once moved; calomel and croton-oil to be repeated, and followed by sulphatis quinnæ, gr. v., every three hours; iced beef-tea to be freely given; continue the ice-bag without intermission.

Evening visit.—Rigidity of muscles yielding; pupils slightly contracting; can obey directions; bowels once moved; slept a few minutes in the afternoon; pulse 100; tongue clean; herpes of upper lip now appearing; continue the quinine and beef-tea, and ice-bag at three hours interval.

Half-past nine A.M., August 29th.—Decidedly better; consciousness returning; pupils contracting; can recognise faces, and answer questions; rigidity relaxing; can bend the head forward so as to touch chest with chin; had slept five hours; herpes about size of three-penny piece; to continue quinine and beef-tea, which latter he takes freely; ice-bag continued at four hours interval.

Evening visit, 29th August.—Improvement so manifest, that the ice-bag is dispensed with. Quinine and beef-tea continued for the present.

September 1st.—The boy is allowed home, and to attend dispensary. The service of the ice-bag in this case was manifested in the reducing of the muscular tension, the diminution of the excitement and delirium, and the effect on the pupils was very remarkable, the contraction occurring within a few seconds after its application. It might be supposed that the continued application of so large a bag of ice would have caused some local mischief, but such did not appear, allowance was made for some difficulty in keeping the bag applied, owing to the patient's condition.

In some cases where, as in the present one, I have had the opportunity of examining into the conditions under which the attack came on, some extra exertion (which may possibly, however, be assumed to be merely an evidence of health) had been gone through the day or so preceding the development of the disease, whether showing itself as febris nigra, or with spinal symptoms preponderating:—

1	fatal case	in a gentleman,	rowing the day before.
1	„	„	kicking football the same day.
1	„	„	engaged in athletics the day before.
1	„	in an adult,	who had been arranging his house.
1	„	in a child, 5 years old,	who had returned from an over-long walk only a few hours.

And the subject of the present case had been running races the previous evening. The three former cases died with purpuric symptoms; the fourth and fifth cases with the cerebro-spinal, and this one has been saved, as I believe, by the use of the ice-bag, in combination with the free exhibition of quinine and support.

I gave quinine freely in this case on the conservative principle, having been particularly struck with its good effects in the fourth case alluded to, where a 20 grain dose of quinine caused an undoubted improvement for the time; and on post-mortem examination, the most characteristic signs of cerebro-spinal inflammation were manifest, and in the fifth case alluded to, I tried the most active mercurial treatment with support and counter-irritation without avail, the patient being carried off in a short time. As this boy showed from the commencement acute spinal symptoms, I think the results so favourable to the ice-bag treatment, that I hasten to submit it for further trial and experience.

ON THE FUNCTION OF THE AURICULAR APPENDIX.

By ISAAC ASHE, M.B.

(Abstract of Paper read before the Meeting of the British Medical Association, held in Dublin, August, 1867.)

WHEN we find a definite and well-marked piece of mechanism in the animal economy, we are warranted in assuming that it has a definite and well-marked function to perform. No such function has as yet, to my mind, been assigned to the auricular appendix, which nevertheless presents marks of very distinct purpose in its construction. It has been said that it is intended to mix up the blood in the auricle more effectually; but, besides the obvious reply that we have no reason to suppose the blood to require any such process in the auricle any more than in the venæ cavæ, we have, I think, a distinct refutation of this view in the fact that the appendix contracts after the sinus, and hence when most of the blood has been expelled from the auricle.

On the other hand, no sufficient explanation has as yet been offered of the question how the auricle, being a chamber thin and weak in its walls, is yet able, by the muscular

force of those walls, to dilate even to tension a chamber like the ventricle, whose walls are much thicker and more powerful alike in contraction and in tensive resistance to dilatation.

The relaxation of the ventricle no doubt permits the entrance of a certain amount of blood, but this is a very different thing from the state of extreme tension which is subsequently produced by the auricular systole.

But let me point out that the increasing surface of fluid inside the ventricle permits of hydraulic pressure being brought to bear on its distension by means of the auricular systole, in accordance with the well-known hydrostatic law of the equal transmission of pressure in all directions by fluids, the dilating force within the ventricle increasing, *pari passu*, with the capacity of the chamber, and consequently with the increasing resistance of its walls, due to greater tension.

Have we any hints afforded us that the function of the auricular appendix is to carry on and complete this exercise of hydrostatic pressure? I think we have two; the first contained in the fact that the auricle, as is well known, does not completely empty itself of blood; the second contained in the fact that the appendix contracts after the sinus.

In consequence of the auricle not completely emptying itself, not only is it possible for the hydrostatic pressure to be maintained up to the instant of the complete closure of the auriculo-ventricular valves, but also it is possible for this pressure to be exercised by any farther contraction in any part of the auricular cavity, the pressure being conveyed to the ventricle through the small column of blood still remaining in the auricle.

In consequence of the contraction of the appendix after the sinus, the force of the former comes into play just when that of the sinus is nearly spent, in consequence of its complete contraction, and just at the moment when such force is most required, to effect the complete dilatation of the ventricle, and when, moreover, it can be most effectively applied for this purpose, in consequence of the increase of the fluid surface within the ventricle. It is evident that although the force of the appendix acts as a maximum against the walls of the dilated ventricle, it acts as a minimum against the walls of the auricular sinus, by reason of the contracted state of the latter.

In what light are we to regard the presence of the musculi pectinati within the appendix, a structure altogether too complicated and definite to be without a distinct purpose, which is not, as seems to me, satisfactorily assigned by either of the conflicting views commonly given of their function, that is to say, on the one hand, that they are for the purpose of strengthening the wall, which would be too weak without them; or, on the other hand, that they are the remains of a thicker wall, which has had portions removed for the purpose of weakening it, leaving the interstices between these musculi; surely either end might have been equally well accomplished by a definite thickness of smooth wall; surely Nature never so wastes her ingenuity. I regard them as being intended more completely to empty the appendix of blood, by means of their mutual packing together, a purpose which could not so well be accomplished by any thickness of a smooth wall, but which is yet necessary to supply a sufficient amount of fluid for injection into the ventricle, since, without this, hydrostatic pressure fails altogether.

I do not regard it as any argument against the view I have here put forward of the function of the appendix, to say that some animals do not possess it; as well might we deny the functions assigned to our second auricle and ventricle, on the ground that fishes possess but one of each.

I consider further that the auricles themselves are probably also subjected to hydrostatic pressure, by the contraction of the muscular fibres which surround the great veins for some distance from their entrance into them, by which I consider the complete distension of the auricles themselves to be effected.

REPORT ON WINE.

[SPECIALLY PREPARED FOR THE MEDICAL PRESS AND CIRCULAR.]

II. PORT—*(Continued.)*

WHEN we consider the complete monopoly enjoyed for more than a century by the producers of this wine, it is not surprising that the taste acquired and fostered during that long period should not immediately change. Indeed, we know well enough that the protection afforded for a long time failed to establish the wine in the favour of the English people, and a taste slow to grow is naturally slow also to decline. The Methuen treaty, entered into in 1703, may be accepted as the commencement of port-wine drinking in England; for although prior to this date Portugal had sent us some wine, and very likely part of that may have been what we call port wine, yet the quantity was insignificant until the treaty levied a discriminating duty. From the date of the treaty, moreover, there was every encouragement for the growers to send to England their very best wines, and so real port was brought into favour by restrictions which were maintained with more or less rigour for 130 years. In 1704, the first year after the conclusion of the Methuen treaty, England imported 10,078 pipes of port. Under the management of the Oporto Wine Company, established in 1756, the quantity soon rose to an average of 22,000 pipes per annum. During the long war, the imports of this, as of all other luxuries, suffered from the impoverishment of the country, and also from the heavy duties imposed. Still, the discrimination being kept up, the relative proportion of the different sorts of wine was not much affected. The custom-house returns show that in 1830 the consumption of port had reached the figure of 2,869,608 gallons, and this may be considered as the quantity imported up to 1860, when the great revision of our wine duties was effected. Since then the amount has risen to more than 3,000,000 gallons yearly. This increase may be due to the reduction in the duty rendering it practicable to import inferior wines. At the same time it must be remembered that the increase is very trifling compared with that of French and other light wines.

The varying qualities of the wines produced in the same vineyards from year to year have often been commented upon, and form a subject of every-day conversation. The following statement as to the quality of produce of the port-wine district will not be devoid of interest. It is extracted from the blue-book already mentioned:—

1840	...	...	very fine.
1841	...	...	very bad.
1842	...	...	fine.
1843	...	...	middling.
1844	...	...	fine.
1845	...	...	inferior.
1846	...	...	good.
1847	...	...	very fine; rich.
1848	...	...	good; not so rich.
1849	...	...	middling.
1850	...	...	fine; very good.
1851	...	...	very fine.
1852	...	...	good.
1853	...	...	very good.
1854	...	...	fine.
1855	...	...	bad.
1856	...	...	very bad.
1857	...	...	bad.
1858	...	...	very good; rich.
1859	...	...	middling; watery.
1860	...	...	very good; dry.
1861	...	...	fine; rich.
1862	...	...	good; dry.
1863	...	...	very fine and rich.
1864	...	...	middling sweet and rather poor.
1865	...	...	good; not liked at first, but turned out well; rich.

The vintage of 1866, a cold and rainy season, was perhaps as bad as in other wine countries; but more was produced than was expected, and the wine has, at least, proved remarkably sound.

We come now to a consideration of the district in which

port wine is produced, and of the process adopted for obtaining it. So many conflicting accounts have been published, that it is quite evident some writers have included certain Portuguese wines in their descriptions which others have omitted. We have been treating up to this point of what is usually understood by port wine—the produce of a very small extent of country on the Douro. Before we can fully enter into the discussions that have arisen respecting this wine, it is absolutely necessary to devote some attention to the method of producing it, and as Mr. Crawford's report contains the most recent and authentic description, we have no hesitation in reproducing such passages as will serve our purpose, especially as they contain a number of incidental facts of considerable interest. He writes in the "Commercial Reports of the Foreign Office" (pp. 106-8) :—

"The true port wine is grown in a narrow strip of country along both banks of the river Douro. The greatest length of this district is twenty-six miles, and it lies nearly due east and west with the course of the river; its average width is six miles. The geological formation is a peculiar brown slaty schist, and the country is a series of lofty and precipitous hills. The wine-growing district is divided into two portions, known, from the name of the river which here falls into the Douro on its right bank, and separates them, as the Upper and the Lower Corgo. The wine district originally was confined to the Lower Corgo, where the soil is more loamy and the country less mountainous than the upper district.

"In the Upper Corgo the best wine is now grown, but the produce of the vineyards is not so great as in the Lower Corgo; the soil above being singularly barren, and more nearly resembling the debris from a stone quarry than a very highly-cultivated ground.

"The vines grown in the two districts are distinct, to some extent, in their species, and, to a greater extent, in the character of the grapes which they produce. A vine much grown in the Lower Corgo, and which may be taken as a type of all the species there employed, is the Bastardo—a producer of a fine wine with a large proportion of saccharine matter, of a very delicate flavour, but with very little colour. Another vine frequently used in the Lower Corgo, is the Alvarilhao.

"The grapes in the Upper Corgo are less abundant producers of a wine possessing more body, and of a very full colour and remarkable flavour. Among the varieties of vine, the most frequent are the Touriga the Tinta Francisca, Tinta Caa, &c.

"The vines are grown as in France, that is, close to the ground; not creeping over it, as at Xeres, nor supported on pollards or trellises, as in most other parts of the Peninsula, and in the majority of Italian vineyards.

"The operations of the vintage differ only in two or three material respects from those followed in France; and the differences in culture are, in general, not more considerable than the difference of soil and climate renders essential. One more material difference is, that the vine is so pruned as to leave fewer shoots for the ensuing year. This excessive pruning produces a richer grape, though a less abundant crop, than the French system. Again the grapes are gathered, not as in France, when they are merely ripe, but only after they have lost some part of their water by their continued exposure to the sun, and when, therefore, they are beginning to dry up into raisins, by which process the sugar and other ingredients in the grape, and subsequently in the wine, are developed in larger proportions to the watery particles; resembling, in this respect, those richer and very expensive wines (too costly for commercial purposes) which are known in France as "vins de paille," and are produced from grapes gathered in the usual way, but allowed to ripen afterwards in the heat of the sun.

"The vintage takes place, according to the season, from the 29th of September to the 10th of October. At this season, great numbers of labourers, principally from the adjacent villages and from Gallicia, flock into the district, increasing the numbers of those already engaged in the vineyards throughout the year. The average daily wages (with food supplied) are, for a vine-dresser, 1s.; for a common labourer with the hoe, from 8d. to 10d. The grape-gatherers are chiefly women and boys; their wages average 7d.; the allowance of food not, however, in any case, including bread. The exceedingly stony nature of the soil throughout the district, and particularly in the Upper Corgo, renders the use of the spade impossible; and even the ordinary hoe, the general implement of manual cultivation in Portugal, cannot be employed in the wine district. The tool used is a hoe (*cuxada*) having two strong prongs instead of the usual cutting part, and a heavy mass of iron on the opposite side. With the forked part, the large stones in the vineyards are turned over; with the other they receive one or two blows, which break them up, and expose them more thoroughly to the decomposing action of the atmosphere.

"The wine-making, though at first sight primitive, is, in all essential particulars, very cautiously and skilfully performed. The over-ripe or inferior grapes being picked out, the rest are thrown into a large stone-built vat (*lagar*). Into this as many men as can easily find room enter, and tread out the juice. The men stay in from twenty to thirty hours; the must is then allowed to stand until a thorough fermentation has taken place. At the fitting moment, judged either by the experience of the wine-maker, or more precisely by the use of the *glucuænometre*, the wine is run into tonnels which may contain from five to thirty pipes. It is now that a small portion of brandy is added, as is also done with sherry and madeira, to prevent the wine, containing as it does so many rich ingredients, from running into an excessive fermentation, and so losing too much of its saccharine matter. The necessity or expediency of so adding spirit at this stage of the process has been disputed by persons perhaps only theoretically conversant with the process of wine-making, but it is difficult to apply preconceived theories to the subject, in the presence of persons who have made it the business of their lives, whose interest it is to use as little spirit as possible, who are singularly free from prejudice, and whose continual efforts have been to enforce improved and enlightened processes of manufacture and modes of cultivation upon the farmers. It is very certain that, when made without brandy, the wines of the Douro, even if they would keep, which is a disputed point, have not any of the softness or flavour of port wine; but are intermediate in character between claret and burgundy, without possessing either the delicate bouquet of the one, or the flavour and 'roundness' of the other.

"The wine remains in the tonnel until the fermentation is checked by the cold weather of autumn, as is shown by the wine becoming clear and bright. This will occur towards the middle of November. The wine is then run off into pipes, containing each 115 gallons, and is ready to bring down to Oporto.

"It has latterly been the practice for most English firms to buy the wine by anticipation, and to superintend the making themselves. This has been the case for about twenty or thirty years, and has undoubtedly checked many malpractices on the part of the farmers, and led to much more care in the preparation of the wines.

"The new wine is brought down the river Douro in the early spring months, the river transport costing about 8s. 10d. for each pipe, and is lodged in the warehouse of the merchants at Oporto. It is here kept till ready for shipment to England, seldom being fit for that purpose for at least eighteen months."

We have not abbreviated Mr. Crawford's description, although it contains opinions to which, as the readers of the first portion of this report (MEDICAL PRESS AND CIRCULAR, Aug. 28), will have foreseen, we are not prepared to subscribe. A more thorough investigation of these theories will follow in due course. In the meantime, we are called upon, in reply to the inuendo about "*persons perhaps only theoretically conversant with the process of wine-making*," to remind the writer of a fact of which he is well aware, since he refers to it immediately afterwards—viz., that the late Baron Forrester was the chief person, and one of the earliest, too, who condemned the practice of brandying wine. Baron Forrester was not a person "only theoretically conversant with the process," but one of the most successful and scientific port-wine growers who ever lived one who earned the gratitude of Portugal for his improvements in the cultivation, and thus not only a practical man, but as Mr. Crawford himself admits, one "well calculated to form valuable opinions on any question connected with port wine." The reader will scarcely fail to notice another phrase of the above quotation, that in which the purchase by Englishmen of the wine by anticipation is admitted to have "*undoubtedly checked many malpractices on the part of the farmers.*" It would seem then if the addition of spirit be defensible, practices have existed which Mr. Crawford himself would scarcely defend. What we fear is, that they have not been efficiently checked, and

that others equally pernicious may have been introduced. This we shall inquire on a future occasion. At present we are concerned with the admitted practice of strengthening the wines by the addition of spirit—a practice technically termed *fortifying*, and which not only mere theorists, but practical growers, of whom the late Baron Forrester is a leading example, have unequivocally condemned as unnecessary and even injurious. We confess to a prejudice in favour of this view. We have read, and read patiently, all that has been said in favour of *fortifying;* we have heard from the lips of its advocates, their defence of the practice, but we are not convinced of its necessity. They tell us the English palate demands a spiritous liquor, but we reply that we have during the lifetime of the late Baron, drunk some of his wines, and declare that we have never tasted such delicious port. They talk of relative *strength*, and we prove to them, by analysis, that the amount of alcohol has nothing to do with the *quality*. They tell us this will not keep—the other, will not bear transport. We say Forrester's port was brought to this country—is brought to this day, and we certainly think that *fortifying* is a practice not to be encouraged.

But if little can be pleaded for the grower adding spirit at a certain stage of the fermentation, what is to be said of the importer who adds it when it arrives in this country? That at any rate is not necessary to elicit the perfection of the flavour of the grape, nor to complete the process of fermentation, nor to enable the wine to bear the voyage! It may be necessary to help to conceal the addition of other ingredients—say, as we are not now discussing noxious ones—simple water. But nothing else can be said about such malpractices. Water, brandy, potato-spirit, noxious substances—the addition of all or any of these by our merchants, is only correctly described by one word—ADULTERATION.

Hospital Reports.

SPECIAL REPORT ON THE TREATMENT OF UNUNITED FRACTURES.

No. VI.*

Professor BIGELOW'S Cases continued.

Case 8.—*Humerus.*—W. W., carpenter, aged 28, entered the hospital, January 2nd, 1865. He had his left humerus fractured, twelve weeks before by the falling of an elevator in the Pacific Mills. The fracture was simple, and treated in the usual way without success. On admission, there was an ununited fracture of the left humerus at a point a little below its middle. The ends of the fragments were in apposition. R. Syr. hypophosphit, ʒ ij., t. d. s.

January 7th.—A narrow-bladed knife was pricked through the integument and muscles to the bone, at the point of fracture. A small drill was then introduced through the wound, and each end of the bone was drilled in three places. The arm was placed in an inside and outside angular splint.

26th.—No union has taken place.

February 25th.—Operation by Professor Bigelow. Ether having been administered, a straight incision was made through the integument, on the outside of the arm, to the bone. The musculo-spiral nerve was so drawn out of place and embraced by the bone that it was accidentally divided in the blood which swelled up from the tissues, still inflamed from the operation of six weeks before. The ends of the bone were dissected from the periosteum, everted and sawed off. A piece, half an inch long, was taken from the upper fragment, and three quarters of an inch from the lower. A hole was then drilled through each end, and a silver plated, copper wire passed through and twisted. A suture was passed through the neurilemma of each end of the divided nerve and the extremities brought together. Several arteries were tied; the wound was closed by sutures, and the arm placed in an inside angular splint, to which it was first firmly bandaged, and then placed upon a flat angular splint, reaching from shoulder to hand.

26th—Numbness over the dorsal surface of thumb and index finger, and general paralysis of the extensors of the wrist and fingers.

March 3rd.—Wound suppurating healthily.

8th.—Hand considerably swollen, and elbow looking angry and red. The wound is everywhere open. The suture applied to neurilemma came away to-day. R. Pil. ferri iodidi., gr. v., 3. t. d.

16th.—Wound closing.

31st.—Considerable stiffness at point of fracture.

May 6th.—Humerus quite stiff.

25th.—But little discharge from sinus about wires. Appetite and general health excellent.

June 24th.—Under ether, the wire was untwisted and withdrawn. The humerus is perfectly stiff. Sensibility has returned to the thumb and index finger, but motion in all the extensors of the hand and wrist is absent.

March 17th, 1866.—He called at the Hospital to-day. He has worked at his trade since last August, without inconvenience. Motion in the extensors of hand and wrist has returned perfectly. The humerus is perfectly firm and free from pain.

Remarks.—The union of the musculo-spiral nerve, which was completely divided and brought together by suture of the neurilemma, with restored function, is a point of great interest.

Case 9.—*Humerus.*—T. G., labourer, aged 26, entered the hospital, June 12th, 1865. A year before he was thrown from a hand-car, one wheel of which passed over the middle of the right humerus, inflicting a compound fracture. The arm was placed in an inside angular splint, and kept in position for six weeks. The external wounds healed readily. At the end of this time, the arm was again broken at the original point of fracture and never again united.

June 21st.—Professor Bigelow made an incision, three inches long, on the outer aspect of the arm, over the seat of fracture. The musculo-spiral nerve was then sought, carefully dissected in its sheath from the bone, and turned aside. The periosteum was stripped back from the end of each fragment. A piece, half an inch long, from the lower, and three quarters of an inch from the upper bone, was sawed off. The ends were then drilled on the outer side, and a silver wire passed through; the ends of the bone were placed in apposition, and the wire twisted by four half turns. The arm was placed in the same apparatus as that used in the previous case. The edges of the wound were brought together by sutures.

23rd.—Apparatus re-applied. The bones are in good position. Some œdema of the arm.

27th.—Suppuration is established. R. Calcis phosphat, gr. x., three times a day.

July 3rd.—The arm is much swollen about the wound, and covered with an erysipelatous blush. He complains of some headache and nausea. R. Quiniæ sulphat., gr. ij., three times a day.

10th.—The swelling and redness have disappeared. No union at point of fracture.

28th.—An outside angular splint was applied, the arm supported by a leather sling, and he was allowed to sit up.

August 7th.—Apparatus removed and re-applied. There is slight stiffening at point of fracture.

22nd.—Only slight motion can be detected in the humerus.

September 11th.—The arm is stiff, but he complains of pain at the seat of fracture when it is examined.

November 4th.—All discharge and soreness having disappeared, and the humerus being perfectly stiff, a pair of

* Gentlemen who may be willing to furnish reports of cases of ununited fracture to be included in this special report, will oblige by forwarding them immediately to the Editor of the Hospital Report Department, 20, King William-street, Strand, London, W.C.

curved scissors were thrust down, the wire cut close to the bone, and easily withdrawn.

December 15th.—The humerus is firm. Discharged, well.

Case 10—*Humerus.*—W. M. W., carpenter, aged 33, entered the hospital January 26th, 1866. He was wounded with a Minié ball at the battle of Gettysburg, and suffered a compound comminuted fracture of the right humerus. July 5th, the bone was resected and about three inches removed. The wound healed in five months after exfoliation of the sawn extremities of the humerus. No attempt was made to keep the bones in apposition, and no union was obtained. He resumed duty and served out his full time with his regiment. The wound has never re-opened or caused him any trouble. Now several inches of the middle of the right humerus are gone, and the two extremities can be felt, pointed and considerably absorbed. The whole arm is quite small from disuse. The motion in the shoulder and elbow is perfect, but the arm hangs useless from the loss of substance in the shaft of the humerus.

January 27th.—Dr. Hodges, on behalf of Prof. Bigelow, operated as follows:—The patient having been placed under the influence of ether, a longitudinal incision was made over the ends of the fragments. The end of the lower fragment was then everted; the periosteum was carefully detached for a sufficient distance and turned back, and half an inch was sawn off from the end of the bone, which was firm and healthy. The upper fragment was treated in the same way, but the end, three quarters of an inch of which was removed, was degenerated and quite soft. These ends were then drilled; silver wire was inserted and the ends approximated, leaving a small interval to allow slight movement. The periosteum was returned to its place, a few vessels were tied and the external wound partly closed by sutures. The arm was placed in an internal angular splint. Water dressing.

30th.—The arm is in excellent position. Suppuration is beginning.

Feb. 21st.—A large abscess above wound evacuated itself to day.

March 11th.—He walks about every day. Apparently some stiffening at the point of fracture.

17th.—An abscess is forming on the inner aspect of arm.

20th.—The abscess was opened and discharged freely.

31st.—The humerus is quite firm. He was discharged to day, to return once a week.

April 27th.—Scarcely any motion can be detected at the point of fracture.

May 23rd.—An incision was made down upon the wire, which was cut and withdrawn. The union of the fractured ends is firm. The apparatus was removed. Patient returned to work.

Case 11—*Humerus.*—P. M., labourer, aged 23, entered the hospital, January 12th, 1867. He was wounded at the battle of Cedar Mountain, 1862, by a musket ball. The left humerus was shattered at a point a little above its middle. The small pieces of bone were removed; the ends sawed off and the fragments approximated. Six months later there was no union; the ends were again sawed off and the bones wired together. At the end of two weeks the wire was removed. In October, 1864, a number of pieces of necrosed bone were removed from the seat of fracture; there was no union. In November, 1865, he entered the hospital. The left humerus had a false joint at its middle. There was necrosed bone at the bottom of a couple of sinuses in the lower fragment. An incision was made over the fracture; the periosteum reflected and the ends of the bone sawed off. In March, 1866, there was no union. March 31st, the periosteum was detached from both fragments for a sufficient distance; about one and a half inches was sawed off from the lower and one inch from the end of the upper fragment. The ends were drilled, silver wire inserted, and the fragments placed in apposition. The periosteum was then replaced and its edges united by sutures. April 28th, the arm had stiffened at the point of fracture. June 10th, he fell upon the arm and broke it. July 15th, he was discharged with an ununited fracture, to return when the arm looks and feels better.

January 12th, 1867.—Patient was etherized. An incision, three inches long, was made over the outer aspect of arm and carried carefully down to the point of fracture. The two ends were found to be much roughened. Great difficulty was experienced in everting the ends of the now short fragments and in detaching the periosteum. The bone was finally separated from the periosteum for a sufficient distance, and a piece, one inch long, sawed from the upper, and one, three quarters of an inch long, from the lower fragment. The lower fragment was two inches in diameter; the upper one was of normal size but with fatty degeneration of the marrow. A hole was drilled through the sides of both fragments; a silver wire was inserted; the ends were placed in apposition and the wire twisted. The periosteum was replaced and its edges united by sutures. The external wound was partly closed by sutures. A folded towel was placed in the axilla to lift out the short upper fragment, and the arm secured to the side, the forearm across the chest.

13th.—There is almost complete paralysis of the extensors of the fingers of the left hand. No nervous trunk was known to have been divided in the operation, and the paralysis is perhaps due to a compression of the nerve in very forcibly everting the shortened fragments.

21st.—The arm was placed in an apparatus, which consists of a firm cap about the shoulder, secured by a strap around the chest; this is made firm by two steel bridges to a splint that invests the forearm like a coat sleeve.

27th.—Arm remains in position. Power of extension returning to the fingers.

Feb. 3rd.—Wound diminishing. Granulations healthy.

6th.—℞ calcis phosphat., gr. x. t. d. s.

March 4th.—Took some walking exercise.

April 16th.—Quite firm at point of fracture. Flexes and extends forearm easily.

22nd.—Discharged.

Notes.—The humerus was in this case considerably shortened by the successive operations. At the time of his discharge it measured seven inches less than the opposite one. Yet, the biceps and triceps acted freely, proving that a greatly shortened humerus is much more useful than one in which a false joint exists. A perusal of this case alone is sufficient to encourage surgeons in repeated attempts to bring about long union. This, however, is a point which can be discussed in a summary after other modes of treatment have been illustrated.

JERVIS-STREET HOSPITAL, DUBLIN.

A CASE OF SEVERE INJURY OF THE EYE, WITH PROTRUSION OF THE VITREOUS HUMOUR.

Under the Care of Dr. AUSTIN MELDON.

(Reported by Mr. HENRY C. KELLY.)

M—— R——, a delicate looking girl, aged 14 years, was admitted into Jervis-street Hospital on the 13th of August, suffering from a severe wound of the left eye. She stated it was produced by a stone thrown at her. On examination it was found that the conjunctiva and sclerotic had been lacerated, and that the vitreous humour protruded through the wound, the acqueous humour having entirely escaped. Sight was completely lost. Dr. Meldon having reduced the hernia with a probe, endeavoured to keep the lips of the wound together with a fine suture, but the conjunctiva was so lacerated as to render this impossible, consequently the eyes were closed, and a small pad placed over the injured one. Two leeches were applied to the external cauthus, and the patient was put on small doses of hydr. c. creta.

On the 15th the conjunctiva was much inflamed, and

the patient complained of great pain. Four leeches were applied.

On the 17th the pain had subsided, there was a purulent discharge.

On the 20th the hernia seemed much diminished, the conjunctivitis less, and the patient was able to distinguish objects. From this date she progressed favourably, and has now recovered almost perfect use of the eye.

Reviews.

CHEMICAL PHYSICS: Part I. of the Elements of Chemistry. By WILLIAM ALLEN MILLER, M.D. 4th edition. Longmans, Green, Reader, and Dyer. London. 1867.

DR. MILLER'S Chemistry is so well-known to scientific men that a list of the changes introduced will be a sufficient description of this edition.

The new system of atomic weights, and the method of notation dependent thereon, is used. The use of barred letters (introduced into the last edition of the "Organic Chemistry") has, however, been judiciously discontinued. The employment of the metric equivalents to the English weights and measures, and the introduction of the centigrade value for degrees of temperature are some of the changes observable. Descriptions have been introduced in their proper place of the researches of Deville, and of Graham, upon the permeation of metallic septa by gases at elevated temperatures.

The experiments of Gladstone, Dale, and by Landolt, upon the connection of the optical properties of bodies, with their chemical composition. The section upon spectrum analysis has been re-written. Also, some account of the British Association standard of electrical resistance, as well as the machines of Holmes and of Wilde, for producing light by magneto-electric currents, will also be found in their appropriate places.

"Chemical Physics" must mean, according to our ideas, such parts of the physical sciences that have a practical bearing upon chemistry—means towards the working out of a particular end—and that end, the study of the combination and decomposition of the elementary and compound matter. Therefore, we see a little inconsistency in the fact that many of the principles which are of immense practical use to the chemist are meagrely disposed of; whilst more than one-third of the volume is devoted to electricity and magnetism. It seems as if the author luxuriated in electric science. For instance, the science of optics is of much more importance to the chemist engaged in original research, and affords means to the chemist of extending his researches in a path which, without such aid, would be unapproachable. The action of organic substances (alkaloids and hydro-carbons) in connection with circular-polarization; also, the absorption-spectra of Prof. Stokes, are but a few of the many points bearing upon what we have stated above. Therefore, we should be pleased to see a larger space devoted to these points, although we ought, perhaps, to make an exception to spectral analysis, and the investigations of Kirchhoff, Bunsen, Miller, and others connected therewith, which are given at some length.

The difficulty in drawing the line of distinction between physics and chemistry is evidenced even in the definition given by Dr. Miller.

"In indicating the physical properties of sulphur, we refer to its brittleness, its crystalline structure, its faint peculiar odour, its yellow colour, its semi-transparency, its electrical excitability, or the facility with which, if rubbed, it exhibits electrical attraction and so on. But in describing the chemical properties of sulphur, we indicate its inflammability, its tendency to unite with silver or copper when heated with it, *its insolubility in water and alcohol, its solubility in oil of turpentine*, and in alkaline liquids. In short, we notice those operations by which the body usually becomes changed and loses its distinctive physical character."

Now, it is self-evident that the chemical properties given in italics (the italics are our own)—*i.e.*, its solubility or insolubility in liquids—is strictly a physical property, solubility being nothing but a state of attenuation.

Dr. Miller appropriately closes his volume by a *resume* of force, its transformation and indestructibility, or, as it is sometimes called, the correlation of the forces.

It is difficult to close this short notice of the important work before us without giving some meed of praise. To bestow the usual stereotyped phrases would only be an insult to the author of what is certainly, taking it all in all, the most successful "Elements of Chemistry" in our language.

It is a work teeming with information, and touches upon almost every point essential to a succinct elaboration of the science.

C. R. C. T.

VIA MEDICA: A Treatise on the Laws and Customs of the Medical Profession in relation especially to Principals and Assistants, with Suggestions and Advice to Students on Preliminary Education. By J. BAXTER LANGLEY, M.R.C.S., F.L.S. London: Hardwicke, Piccadilly.

THE utility of a small manual on such a subject as this is so obvious that we may well feel some surprise that no attempt worth mentioning has hitherto been made to produce one. We hasten to announce the publication of this handsome little volume, because at this period of the year, when so many are pondering their entry into the profession, it is of double interest, and also because the author has enjoyed peculiar opportunities for fitting himself for his task. Our own "Students' Number," will, next week, place in the hands of those about to begin their hospital career, a large amount of necessary information, as to the Session of 1867-8. Mr. Langley's work takes a wider sphere and will be of more permanent interest. He takes the medical pupil, before he begins hospital work, and follows him, after he has finished it, into the active duties of the profession, whether as an assistant or principal. Hence, he has the opportunity of giving hints, the value of which cannot be conveyed in a brief notice like this, as to apprenticeships, assistantships, partnerships, and many other points in a medical career; and these hints, it should be remembered, come from one whose peculiar experience entitles him to speak with considerable authority. On a future occasion we propose to examine with care, some of the recommendations contained in Mr. Langley's work. In the meantime we announce its publication, and in default of space to analyse it at length, furnish those interested, whether parents, guardians, or students themselves, with an outline of some of its contents. Having discussed the several ranks in the profession—the physician, surgeon pure, apothecary, and general practitioner in their several relations. Mr. Langley passes on to assistants. In this chapter he speaks of the pupil with indentures, the apprentice, the dispenser, the unqualified assistant, the "indoor" and the "outdoor" assistant, the prospects of unqualified and qualified men, the present educational position of young men. and the *locum tenens*.

Then follows a very useful chapter on the legal relations of the parties, in which the following items are set forth:—How a legal engagement is made, assistants and partners, what constitutes a partnership, notice to leave and leaving without notice, liabilities of assistants, dismissal, liabilities of principals, apprenticeship, maintenance, indoor assistants, outdoor assistants, formal agreements and bonds not to practice, death, of employer, mutual liabilities of the parties, testimonials and references, libels, &c.

There are many of these points on which we might advantageously dwell, but we pass on to others equally important.

Mr. Langley next devotes a chapter to the business relations of the parties. In this he shows how engagements are usually made between principals and assistants, treats of advertising, and of agents, of ship appointments, and of assistantship with a view to partnership.

The fifth chapter is entitled Duties in the Surgery, and is perhaps the most important of any, treating as it does of many subsidiary duties as they are sometimes regarded, but the efficient discharge of which, is necessary to the proper conduct of a practice. We commend this chapter as particularly calculated to promote the comfort of both principals and assistants. In it we find remarks on the basis of the mutual contract between the parties, the source of quarrels between principal and assistant, what the assistant is expected to do, dispensing, stock-keeping, the visiting list, the day-book, routine of work, book-keeping, bad writing, the ledger, "posting," making out bills, receipt of accounts, the cash-book, the necessity of systematic arrangements, druggists' invoices and parcels.

The work concludes with a chapter on Preliminary Studies, a consideration of which we must defer.

DAVY AND FARADAY.—"The greatest discovery you ever made," said President Gilbert to Sir Humphrey Davy, "was the discovery of Faraday."

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 11, 1867.

THE SEWAGE OF GREAT CITIES AND TOWNS.

Having alluded in a previous number to some of the difficulties and disadvantages attendant upon the present main drainage system of London we would now offer some observations upon that most important question—the arrangements for the conveyance of, and ultimate disposal of the sewage of cities and towns.
